Prof. Hall Griffin had amassed much material for a biography of Browning, whose career and writings had been for many years a principal subject of his thought and study, and had written about half of his projected work when death struck the pen from his hand. Mr. Minchin, on the advice of the late Prof. John Churton Collins, undertook the completion of the work in accordance with Professor Griffin's plans, and so successfully has he accomplished that difficult task that the book has the artistic unity, both in structure and in style, of a finished and well-rounded whole. The author's purpose was to produce a biography that should be both fuller and more exact than those of his predecessors, and this has been achieved.

The book is not a study of the life of Browning seen thru a temperament, like those, for instance, of the late William Sharp and of Mr. G. K. Chesterton (both brilliant and both charming, in their different ways), but is a record based upon a sympathetic review and interpretation of accepted facts. Numerous errors of fact and of inference, made unwittingly in the earlier biographies, are corrected; for to this end a mass of new material was available. As an example of what this means: Mrs. Orr did not have access to the "Letters of Robert Browning and Elizabeth Barrett Browning," the four volumes of Browning's letters privately printed by Mr. Wise, or the unpublished diary of Alfred Domett (Browning's "Waring"), which last was practically discovered by Professor Griffin; and further recollections and reminiscences by scores of the poet's contemporaries have been given to the world since her book appeared. Professor Griffin had been at great pains to identify the sites of the poet's early homes in London; thence had followed him to Asolo and Florence; had made pilgrimages to the various regions of Italy visited by Browning and his wife, and had visited La Saisiaz and Venice and other places where Browning had sojourned in his later years.

So this book traces more accurately than any other the life of the poet from year to year. No systematic interpretation of poems is attempted, such as is included in Professor Dowden's "Robert Browning," nor any detailed criticism; but everything that has been discovered as to their origins, their growth and their reception by the public is included. New light is thrown on the ways Browning found or chose themes for his poems, and on his mental processes. Thruout his life he was a lover and student of books as well as of men. He was never

*"The Life of Robert Browning." With Notices of the Writings, the Family and the Friends. By W. Hall Griffin. Completed and Edited by Harry Christopher Minchin. With Portraits. Illustrations. New York: The Macmillan Company. $3.50 net.

a literary or historical antiquary. His varied knowledge came to him in the most natural way. As a youth he read extensively among the historical works in his father's library, and thus unconsciously developed that tendency toward historical accuracy which is so singularly combined in him with imaginative power. While his learning was very wide and varied, our author asserts that his "extreme erudition" "is often more apparent than real," and proceeds to show that many of the poet's notes to his "Paracelsus" that seem to savor of "vast research" were indeed copied from an ancient author. But it is no reproach to him that he gathered knowledge wherever he found it. One of the greatest attestations to his genius is that "the most important source" of all his works is Robert Browning.

Many details of a singularly beautiful and happy life are here given for the first time, but none among them detracts in any way from the image the world already had of a virile, noble, pure-minded, lovable man. Browning has long been recognized as a powerful religious teacher, but the exact nature of his personal beliefs has puzzled many people. An interesting sidelight is flashed on this question by Domett's diary. Byron's assertion of the soul's nothingness in comparison with the ocean is attacked "somewhat boisterously" in "Fifine at the Fair" and again in "La Saisiaz"; and when Domett exprest surprise thereat (since his friend had been devoted to Byron in earlier years), Browning averred that he protested against it as a Christian. "I never heard him, I think," comments the diarist, "avow his Christianity distinctly in his own person, except on this occasion."

**Greek Immigration to the United States.** By Henry Pratt Fairchild. New Haven: Yale University Press. $2.

This volume on Greek immigration is the first detailed investigation of the Greek element mingling itself with other foreign elements of the United States. The Greek population of the United States appears to have grown from about 8,000 in 1900 to about 185,000 in 1910. It is therefore becoming more of a so-called problem, as we are wont to call our social groups of nationalities newly arrived. It appears that there are several colonies of Greeks in different parts of the United States, one in Chicago numbering about 15,000; one in Lowell, Mass., numbering about 7,000; one in Lincoln, Neb., and one in New York, less distinctive than the others, numbering about 20,000. The author points out that the Greeks have gone into the candy business, shoe shining parlors, and the peddling of flowers very largely. He concludes that financially the Greek finds his life in America an improvement over the one he left. On the other hand, he deprecates the padrone system, by which Greek boys are brought over here and maintained in crowded quarters and under degenerating conditions. He believes that the Greek can add to American life some of the elements of Greek life, such as "hospitality, courtesy, music love of outdoors and the tempering of business activity with a certain amount of leisure and social intercourse." "On the other hand, America has much to give the Greek in respect of commercial honesty, unselfishness, truthfulness, harmony, stability, regard for women and children, and social virtue."

**Essays in Fallacy.** By Andrew MacPhail. New York: Longmans, Green & Co. $1.50.

In spite of all his oxymorons, this author is a complete conservative. He is that, much more than he is image-breaker, when he declares that "All novels are written for women except the few which are worth writing;" and again: "To speak of the 'American woman' as if she were confined to, or even especially characteristic of, the United States, is as if one were to assume that the common scale which destroys apple trees is found nowhere else than in San José." It is likely, he adds, that the "American woman" was introduced into the States at a very early period; and, finding the environment favorable, throve "with coarse luxuriousness." Mr. MacPhail is singularly ungallant in his images: he even draws an analogy from the case of the "Old English" black rat

and the "Hanoverian" brown rat, Mongolian in origin:

"And yet the analogy is scarcely convincing, since rats increase and multiply by the process of ordinary generation, whilst the type under consideration breeds only very sparingly. By a process of calculated sterility, which eventually becomes automatic, she attains to the illusory reward of childlessness."

Childlessness, divorce, and some other social phenomena not so hackneyed, are emphasized by the Canadian critic. "Previous to the year 1840," he writes, "the increase in population by native reproduction was seven times greater than the growth of immigration." Washington and Jefferson estimated that by 1875 their country would contain sixty million native-born Americans. "As a matter of fact, according to the census of 1900, the numbers were not more than forty-two millions." In reporting upon this situation, the essayist is led astray by no exaggerated affection for our native-born. But the American woman is not Mr. MacPhail's sole fallacy. He scores with brilliancy English as well as cis-Atlantic phases in education. He is very skeptical as to the Oxford experiment in workingmen's "education." As for the traditional program, its main result was, he says, "that boys with minds which were capable of improvement were educated and became leaders of men. The boys without such minds were relegated to their own place without loss of time . . . The aim of the American method is to bring the whole mass up to the same level, with the result that there are few leaders and many uneducated."

**The Revolutions of Civilization.** By W. M. Flinders Petrie. 16mo, pp. 131. New York: Harper & Brothers. 75 cents.

This attractive little book belongs to "Harper's Library of Living Thought," and is half text and half pictures. The aim of the author, who is unsurpassed as an authority in Egyptian excavations, is to prove that there is a succession of waves of civilization, now developed and now degraded, as shown in the products of art, particularly sculpture. This he shows with no difficulty as to Egyptian art. For example, the Hyksos invasion was followed by degradation, and there followed later the higher stage of the eighteenth dynasty. Equally, the better art of Crete was at one time crushed by the Dorian invasion. So far, good; but the author then proceeds to show that for a period of seven thousand years the rise and fall of civilization in Egypt has synchronized with similar stages in Crete, Greece, Italy and the Middle Ages of Europe. Here there is room for the personal equation in judgment and choice, particularly where the materials are scanty, and the scholar is in danger of selecting what will best fit his purpose. In every age there were better and worse examples of art. Then, be it remembered, in those older dynasties there are serious questions of chronology to be considered, and Professor Petrie's scheme adds some thousands of years to that of the German and American Egyptologists. Further, where parallelism between Egypt and Crete is shown, this is only natural, as, quite as far back as 2,000 B. C. there was constant commerce between the two. The evidence for contemporaneity would be more remarkable if it could be shown that the flourishing periods in Babylonian and Assyrian art corresponded with those in Egypt, the materials for the former not being lacking, but entirely overlooked by our author. While he makes the average interval between his eight periods of depression to be 1,330 years, it would be hard to discover anything secular in the causes; certainly China and Japan are not under his law, and the high Babylonian mark of the Elder Babylonian Sargon synchronizes with Egyptian decline, if we are to follow the author's chronology. Barring these points of doubt, the book is full of suggestion and well worth study.

**Incidents of My Life, Professional—Literary—Social with Services in the Cause of Ireland.** By Thomas Addis Emmet, M. D., LL. D. 500 pages; 27 illustrations. New York: G. P. Putnam's Sons. $5.

If variety is the spice of life, Dr. Emmet has had abundance of it, and if spice makes for happiness then he must have been happy. A Southerner born who had to live in New York during the Civil War, a collector of autographs whose reputation is worldwide and whose collection of Americana made

him an authority on the subject, a surgeon who revolutionized his specialty of women's diseases and whose name and book became known thruout the medical world, surely that is a life full enough to satisfy the most ardently strenuous. In spite of its busyness Dr. Emmet is in his eighty-fourth year, hale and hearty, vigorous of mind and active of body except for a badly broken limb hurt two or three times afterward, and is a living illustration, apparently, that having a number of things to do and keeping them all the time so that there is scarcely a moment of relaxation, is the best possible way to prepare for a long life. This busy man has written out many of the incidents of his life in a chatty, personal way that makes them not only interesting, but valuable for the future historian. There is lots of American politics, there is plenty of gossip with regard to Irish affairs, there is an abundance of reference to the women folks and their ways, and to New York and its hospitals, its politics, both medical and municipal, its politicians, its fashionables, all the subjects that are of perennial interest. Twice during an epidemic of cholera in New York, Emmet went over to his immigrant hospital on the Island and found that not only all the patients, but all the nurses in his department, were dead. Twice during epidemics of typhus fever he himself caught the fever. On the last train that left New York for the South at the beginning of the war Dr. Emmet, a native of Virginia, was a passenger, because he felt it his bounden duty to throw in his lot with his State. President Davis sent him back to his wife and family, telling him that they had more physicians than they knew what to do with. He will probably be remembered best for his great collection of Americana, which, under the name of the Kennedy-Emmet collection, is at the Lenox Library.

**Pioneer Priests of North America, 1642-1710.** By the Rev. T. J. Campbell, S. J. Volume III: Among the Algonquins. New York: The America Press. $2.

In the final volume of "Pioneer Priests," entitled *Among the Algonquins*, we find a mass of material valuable to the historian and of deep interest to those of us who know the romantic spell of the French episode in American history. One must confess, however, that the reverend author has failed to knit his materials together into a compact whole—or, indeed, into any kind of whole at all. The two preceding volumes of this series told the story of missionary endeavor among the Iroquois and Hurons; here it is the Algonquins. The Algonquins were, as our readers know, a Northern tribe, counting New England as their country, as also the shores of the Hudson, New Jersey, parts of States as far south as North Carolina and as far west as Wisconsin, and a great part of Canada. The heroism and abnegation of many of the French Jesuits who ministered to these savages is an uncontroverted and glorious fact in colonial history. Among her priests, as among her governors and commanders, France sent out to the New World men of great worth. A combination of circumstances tended to diminish the effectiveness of their labors—even tho the fruits of those labors were not, even in themselves, inconsiderable. Portraits, natural scenery and maps are reproduced, adding to the value of the present study. It is unfortunate, however, that Father Campbell neglects to cite the "uncollected documents preserved in the archives of Canadian Government and private institutions" upon which, in part, he bases his narrations.

**The Pianoforte and Its Music.** By Henry Edward Krehbiel. New York: Charles Scribner's Sons. $1.25.

Mr. Krehbiel's new book is the concluding volume of Messrs. Scribners' valuable series of practical treatises called "The Music Lovers' Library." It is not too much to say at once that it is the best "popular" work on its subject that has yet been written in English. It should serve to correct many misconceptions, or, rather, some misconceptions held by many people who are more or less fond of good music, concerning the evolution of the most popular of musical instruments, concerning the great composers who have written the best music for it, and concerning the development of the virtuosi who have won fame by

playing upon it. Of the three parts into which the book is divided, the first traces the development of the pianoforte of today from its primitive prototypes and medieval precursors — the monochord the clavichord, the harpsichord, the dulcimer, and illustrates concretely and graphically "the tremendous progress made in the art of pianoforte construction from the time of the invention of the instrument till now." The second, which is rightly the longest part of the book, deals with the composers, from the earliest writers of clavier music, the predecessors of Bach, to such "nationalists" as Saint-Saëns, Paderewski, Rachmaninoff, Debussy, Sgambati, and many others among the living today. The final section, devoted to the development of the art of pianoforte playing, ends with Rubinstein and Hans von Bülow. The whole book is a rare combination of historical learning and critical exposition set forth in a style of distinction, ease and grace.

## Literary Notes

....Paul Goodman signs the little *History of the Jews* in the "Temple Primer" series of E. P. Dutton (35 cents).

....For those who do not object to taking their literature in snippets, *The Essential Poetry of Pope*, compiled and edited by William Walker (Dutton; 50 cents), will prove a handy and attractive volume.

....An effort more ambitious than successful is that of C. E. Wheeler's: the translation of Dante's *Divine Comedy* in rimed verse, the triple rhythm of the original being reproduced. (Dutton, three volumes; $1 each).

...The Rev. Washington Gladden of Columbus discusses *The Labor Question* (Pilgrim Press, 75 cents) in a sane, sympathetic and Christian spirit and points very clearly what should be the attitude of the Church in this crisis.

A most attractive book of essays by Sir George Douglas, on *Scottish Poetry*, from Drummond of Hawthornden to Fergusson comes to us from the Macmillan Company ($1 50). These lectures were first delivered in the University of Glasgow.

In the heyday of the suffrage movement, *The Religion of Beauty in Woman*, by Professor Lefevre P. Fletcher (Macmillan, $1 25), is an excellent *deus ex machina*. The volume is in serious criticism what the sweets are to the roast. The Renaissance and its aftermath furnish his types and documents. The essays are written in a light and entertaining style, and in spite of the wide reading which they show will not repel by erudition nor dismay by philosophical profundity.

....Bees have ever been a species attractive to poet and prose writer. Tickner Edwardes in *The Lore of the Honey Bee* (Dutton; 50 cents) shows himself to be an attentive reader of bee-literature, and to have, besides, personal knowledge of the ancient craft of bee-keeping.

....Florence Holbrook's *Dramatic Reader for Lower Grades* (American Book Co., 40 cents), consists of sixteen simple dramatizations of familiar stories, mostly out of folk lore. The use of the book in the fourth or fifth grade should prove an interesting experiment.

....An acquaintance with Mendel's theory of heredity sufficient to comprehend modern discussions of evolution is not easy for the general reader to acquire. Drinkwater's *Lecture on Mendelism* (Dutton; $1) is useful for that purpose, as it gives a brief and clear explanation.

....Lewis Waller, the English romantic actor, will play the rôle of the runaway monk in the dramatization of "The Garden of Allah" to be produced at the Century Theatre in New York (formerly the New Theatre) under the direction of Liebler & Co. The play is announced for October 20.

....Part One of *Mineral Resources of the United States*, Calendar year 1909, is a volume of over 600 pages, devoted to Metals; Part Two (Nonmetals) extends to 942 pages, if we include the index. Valuable statistics and articles signed by experts make these volumes valuable for reference (Washington: Government Printing Office).

The novelist Myrtle Reed left an estate estimated to be worth $200,000. The estate is to be held in trust till her parents die, when it will be transferred to her husband. Novelists' estates do not vary in proportion with their merit as writers, nor even with their popularity, for Marion Crawford left his heirs, it is said, less than one-fourth as much.

....It speaks well for Italy that a series of popular lectures given at the University of Padua by Achille Loria on *Contemporary Social Problems* (Scribner's, $1) can deal with modern economic difficulties so frankly and tolerantly. The author urges a voluntary and radical reconstruction of our social system as the only alternative to a violent revolution.

Proper it is to fast with him who feeds the needy in the morning." Religion consists alone in the service of the people; it finds no place in the rosary, or prayer rug or tattered garment." "Be lenient with thy slave for he may one day become a king, like a pawn that becomes a queen." These and many other Persian aphorisms and parables may be found in the *Bustan of Sadi*, the latest issue of "The Wisdom of the East Series" (Dutton, 50 cents).

...."Harvard Studies in Comparative Literature" open most promisingly, for volume one is Professor George Santayana's *Three Philosophical Poets: Lucretius, Dante, Goethe.* This is a brilliant exercise in criticism, and deserves extended review, in spite of the author's modesty in describing himself as an "amateur" bringing to his subject only familiar material. Professor Santayana's style is always a delight. (Cambridge: Harvard University.)

"As modern civilized society is organized, at least two fundamental spiritual facts are obvious: First, that the current of modern progress in the various organized activities of men is impelled more largely than ever before by good will; and, secondly, that so far as the individual man is kind he is happy, even if he is not materially prosperous."

This is the essence of William Allen White's *Theory of Spiritual Progress* given as a Phi Beta Kappa address at Columbia University and reprinted by the Gazette Press, Emporia, Kansas, an inspiring message coming from one who has become famous thru his skill at interpreting popular feeling and reading the signs of the times.

....The University of California is publishing the second volume of the series of Spanish and early Californian texts under the auspices of the Academy of Pacific Coast History. The first number contains the original Spanish and an English translation of the *Diary of Vicente Vila,* commander of one of the vessels of the Portola expedition from La Paz to San Diego in 1759. The second section of the new volume gives the names signed to the constitution of the *Vigilance Committee*, and No. 3 the *Diary of Pedro Fages* of the San Francisco expedition of 1770.

....The critic of the *Mercure de France* declares that in D'Annunzio's "The Martyrdom of St. Sebastian" the poet's mastery of the French language is not what the press agent has represented it. The distinguished Italian must not imagine he is writing in French because he uses words out of a French dictionary, he says; "this delusion has given birth to a formless and inane verbiage that is meaningless even in the reading," and adds his account of the rehearsals. Mlle. Rubinstein tries to pronounce "en mangeant le doux fruit de vie" and can do nothing better than "en manchant le du frit de fie," whereat the angry dramatist: "Mais non, ce n'est pas ça, mademoiselle. Il faut dire: *en manchant le doux frroui dé vie*... Parlez donc français, qué diable!"

....The distinctive feature of the *Dictionary of French and English, English and French,* compiled by John Bellows, revised and enlarged by William Bellows, with the assistance of MM. Marrot and Friteau (Holt), is the arrangement of *Français-Anglais* and *English-French* on the same page. Thus on pages 71-2 one may, under the former head, find the verb *assister*, "to be present (*à*, at) to attend (à)," etc., while below one may compare the English verb, *assist*, "assister: aider (*in*, à)." For the student of languages this is a remarkably convenient arrangement, also equally logical and instructive. This edition is an enlarged edition of the Bellows pocket dictionary, godsend of travelers. In its present form (12mo; pp. 689) the work will prove useful in library, class-room and office—as we have already proved it.

....The theories of art and the speculations in science found in Leonardo da Vinci's secret notebook form a tempting theme for the novelist. The latest to utilize them is an American author who in the name of "Guglielmo Scala" writes a romance of *Monna Lisa* (Crowell, $1). He handles his material well in the creation of the Renaissance atmosphere, but the book has nothing of the scope and power of its chief competitor in this field, Merejkowski's "Romance of Leonardo da Vinci." Signor Scala is so enamored with the subtle smile of Monna Lisa that we suspect him of having stolen her portrait from the Louvre. Since the author of the novel is unknown and the purloiner of the picture is unknown what is more likely than that they are the same person? According to his theory the reason why Leonardo spent so many years in painting it is because he found all women in his sitter and had to make her sympathetic and cruel, heedless and tender by turns.

....M. Gémier's National Traveling Theater, which is to bring the highest dramatic art before the villagers of provincial France, was lately inaugurated on the Esplanade des Invalides. The play chosen was a somewhat sensational melodrama, "The Submarine 'Swallow.'" The theater consists of two vast tents, 170 feet long by 80 wide. While one is being used the other is on its way to the next stage, for it requires a day to put it up. The tents, stage, costumes, scenery, etc., are packed in thirty-seven vans, and form eight road trains. When fitted up the inside of the theater is very pretty, with pink hangings sewn with painted garlands. The orchestra seats

are comfortable, and on each side there is a row of boxes, these boxes being the vans which convey the actors on their travels. Other cars are used to support the floor, which slopes down toward the stage, so that every spectator obtains a good view. This theater will visit the farthest nooks and corners of France, and holds about 1,500 spectators.

....*Socialism and Individualism* (John Lane, 75 cents) contains four reprinted tracts of the Fabian Society by Sidney Webb, Bernard Shaw, Sidney Ball and Sir Oliver Lodge. In Shaw's essay on *The Impossibilities of Anarchism* is to be found the often quoted paragraph:

"Most people will tell you that communism is known in this country only as a visionary project advocated by a handful of amiable cranks. Then they will stroll across the common bridge, along the common embankment, by the light of the common street light lamp shining alike on the just and the unjust, up the common street and into the common Trafalgar Square where on the smallest hint that communism is to be tolerated for an instant in a civilized country, they will be handily bludgeoned by a common policeman and haled off to the common gaol."

....Giorgio Vasari is known to readers everywhere as the author of the entertaining "Lives of the Most Excellent Painters, Sculptors and Architects." Robert W. Carden, A. R. I., has made him the subject of a biography and "study of the later renaissance in Italy" (Holt; $4). Vasari belonged to the decadence, but his work as sculptor and painter is none the less of a certain importance, and his life was one of unceasing activity. He was associated in one way or another with a good many men greater than himself. Mr. Carden's book is marked by painstaking scholarship. It is generously illustrated.

...."An Outline of the True Mission of Art" is the sub-title of the *Temple of Life*, by Ernest Newlandsmith (Longmans). The work is essentially theoretical. "General Principles," "The First Essential," "Human Progress," "Art in Its Relation to Humanity," are some of the chapter headings. The failure of modern art, of which this writer is persuaded, lies not in a lack of painting schools, concerts and magazines, but in "the misdirection of energy," "the lack of a sufficiently lofty, sound and powerful *motive principle.*" The only possible restoration lies in a return to the religious ideal as "the one and only motive principle of life and work."

....We know that the "Home University Library" will "fill a long felt want" because we receive more letters asking for just such books than for any others, that is, for books that will give in brief and readable form a modern and competent treatment of some phase of science, question in economics or period in history. If our readers will send to Henry Holt & Co. for a list they will save us the trouble of answering some of their questions, so far as the books published are concerned, and we are willing to recommend in advance the future issues of the series. In our issue of June 29 we discussed at some length the first volumes of the Library. The more recent issues are *Medieval Europe*, by H. W. C. Davis; *Evolution*, by J. Arthur Thomson; *Introduction to Mathematics*, by A. D. Whitehead; *The Animal World*, by F. W. Gamble, and *The Science of Wealth*, by J. A. Hobson (75 cents each).

....In *The Mediæval Town Series, the Story of Padua* (Dutton; $1.75) is told with much detail by Cesare Foligno. A short account is given of the early history, but the main thread of the narrative begins in the eleventh century and ends in 1509 when Paduan history merges with that of Venice. The long record of petty disputes and the struggles between families and officials of state and Church is rather wearisome, but the account of the university and the historical descriptions of the art and architecture of this famous city are very interesting and informing, aided as they are by many sketches and photographic illustrations prepared by Giovanni Vianello.

....George Hamlin Fitch is a newspaper writer who takes pleasure in turning from the thousand and one new books to those which do not depend upon novelty for their appeal. In *Comfort Found in Good Old Books* (San Francisco: Paul Elder & Co.) he discusses anything and everything, from the classics in English translation to "Don Quixote" and Omar Khayyám, from the "Arabian Nights" to St. Augustine's "Confessions" and Boswell's "Johnson." Originally these little papers appeared in a Sunday newspaper. They are well calculated to tempt others than the author away from the ephemeral and unessential. This is an attractive volume, with many illustrations from portraits.

*Fifteen Thousand Miles by Stage*, by Carrie Adell Strahorn (Putnam's; $4.00). A pioneer and joyous spirit must have been the heritage of Mrs. Strahorn. The dear lady tells her experiences of travel thirty-four years ago in the then unconquered West, as gaily and spontaneously as tho she were relating them to a friend in a familiar talk. She has no tragedy to record, but plenty of adventurous rides thru the Indian country, sojourns in frontier towns when they were anything but the quiet, well-behaved communities of today, and wild rushes down steep mountain grades clinging to the cow-catcher of an engine, when she and her husband, whom she calls "Pard," forsook the

trail for the rail. The book has many illustrations, ranging from beautiful color plates by Charles M. Russell to some very poor sketches. This unconventional record of cities that began to be in the seventies has a value out of proportion to its place as a work of literature.

We have heard the complaint raised that it will be impossible for historians of the future to have access to our newspaper files, these occupy too much space in libraries and are not going to last, anyway—they are printed on such wretched paper. The problem is solved by photography. "The complete file of a newspaper for one year," writes a French journalist, can be so photographed that it will occupy the space of an ordinary octavo volume, "and will be better preserved on gelatine than on paper."

....Some literary forgeries are more pardonable than others. Chatterton's seemed justified to the romantics, furnishing as they did the "copy" for melodrama. The Vicar of Morwenstow, in passing off his "And Shall Trelawney Die?" as a Cornish antiquity enriched balladry as well as duped Sir Walter. John Cotton Dana, librarian of the Newark Free Library, and a contributor to THE INDEPENDENT, put forth eighteen months ago "The Old Librarians Almanack," and took in a good many reviewers with it, including those of the New York *Sun* and *Evening Post;* professing to have disinterred an eighteenth century pamphlet. Prosper Mérimée was even more ambitious than the Vicar of Morwenstow and Mr. Dana: and no less successful. A contributor to the *Annales littéraires et politiques* recalls the circumstance that he entered literature by the door of a mystification. One of his first works bore the title: "La Guzla, or a Selection of Illyrian Verses Collected in Dalmatia, Bosnia, Croatia, and Herzegovinia." The volume appeared in 1827, when the rage for the exotic was in full swing. It was even translated into German by a Doctor Gerhart, and into Russian by the great Pushkin. It was, of course, an anthology of Mérimée's own invention. In one of the later French editions, the author explained the deception:

"I was dying to go to observe the *local color* of that province, where it still existed . . . Alas! only one thing was wanting—money."

He discussed his voyage with his friend, Ampère, till the thought came to him, why not write his book first and go to Croatia afterward, on the proceeds? Mérimée it was who wrote the "Théâtre de Clara Gazul." Those who were duped by this second fraud ought to have known better: for Gazul and Guzla come to very much the same thing in the end, as the Baconians would be the first to point out.

## Pebbles

REUTER informs us that part of the expedition which was got ready by the Persian government to oppose the ex-Shah consisted of "500 reformed cavalry." Men, we take it, who no longer swear like troopers.—*Punch.*

"THERE is nothing more unsatisfactory than a boarding-house beefsteak," growled the chronic grumbler.

"Oh, I don't know," rejoined the impressionable young man. "Did you ever get a kiss from a pretty girl over the telephone?"

TO WHOM it may concern: Reports having been circulated that I deserted my wife, I wish to say such reports are untrue, and I was practically kicked out. G. F. Elliott.—*Medina (N. Y.) Journal.*

FIRST trustee—But this ancient institution of learning will fail unless something is done.

Second trustee—True; but what can we do? We have already raised the tuition until it is almost 1 per cent. of the fraternity fees.—*Puck.*

THE Rev. Dr. Fourthly—Brother Loosley, you took your wife and went to see a ball game last Sunday, did you? Do you think that was right?

Brother Loosley—Doctor, that was a compromise. She wanted me to take her to a sacred concert.—*Chicago Tribune.*

A TOURIST in the mountains of Tennessee once had dinner with a querulous old mountaineer who yarned about hard times fifteen minutes at a stretch.

"Why, man," said the tourist, "you ought to be able to make lots of money shipping green corn to the northern market."

"Yes, I orter," was the sullen reply.

"You have the land, I suppose, and can get the seed."

"Yes, I guess so."

"Then why don't you go into the speculation?"

"No use, stranger," sadly replied the cracker: "The old woman is too lazy to do the plowin' and plantin'."—*The Bellman.*

THERE is in Washington an old "grouch" whose son was graduated from Yale. When the young man came home at the end of his first term, he exulted in the fact that he stood next to the head of his class. But the old gentleman was not satisfied.

"Next to the head!" he exclaimed. "What do you mean? I'd like to know what you think I'm sending you to college for? Next to the head! Why aren't you at the head, where you ought to be?"

At this the son was much crestfallen, but upon his return he went about his work with such ambition that at the end of the term he found himself in the coveted place. When he went home that year he felt very proud. It would be great news for the old man.

When the announcement was made, the father contemplated his son for a few minutes in silence; then, with a shrug, he remarked:

"At the head of the class, eh? Well, that's a fine commentary on Yale University!"—*Washington Post.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra: to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## An Appeal to the Country

THE Senate has adjourned without taking action on the arbitration treaties negotiated by President Taft with Great Britain and France. The whole matter must now go over till next winter's session. The situation is grave, and demands some plain speaking.

When it was announced some months ago that Mr. Taft was actually proposing to negotiate a treaty in which *all* questions, even those supposed to involve national honor, would be submitted to arbitration, the entire Anglo-Saxon world was thrilled with enthusiasm. Here at last the dreams of the poets, prophets and philosophers were about to be realized in practical statesmanship. In England the response was unprecedented. Ratification meetings were held all over the kingdom, culminating in a great meeting in the historic Guildhall of London in which Mr. Asquith, for the government, and Mr. Balfour, for the opposition, pledged the acceptance of United England to Mr. Taft's invitation. In the United States the peace societies were preparing to organize similar meetings to rouse the country, so that the Senate could not again place its "dignity" above the cause of the World's Peace. But those peace leaders who sought advice from Washington as to whether a great popular demonstration would be welcomed by the Administration were told to keep quiet, that the Administration had confidence that the Senate would approve the treaties without cavil and that public agitation was unnecessary and might do more harm than good. The peace leaders naturally deferred to this admonition, despite the axiom that a good cause never loses and a bad cause never gains by popular discussion. Still the press of the land almost universally supported the proposed treaty and the country as a whole signified its approval, tho naturally with no such degree of enthusiam as in England, where the Government and peace societies put themselves at the head of public opinion.

When it was announced that France was to join with England in also making a similar treaty, there was further rejoicing, for that of course tended to silence the Irish-American opposition, which was beginning to raise the customary objection that the Anglo-American treaty would constitute an "alliance" of offense and defense, ever distasteful to our people since Washington's Farewell Address.

But the treaties with England and France were signed on August 3 and forthwith submitted to the Senate. On the 15th Senator Lodge, in behalf of a majority of the Foreign Relations Committee, reported back the treaties so amended as to prevent the Commissions of Inquiry from sending a dispute to arbitration. This report was concurred in by Smith of Michigan, Borah of Idaho, Bacon of Georgia, Shively of Indiana, Clark of Arkansas, and Rayner of Maryland. Senators Cullom and Root offered amendments to the effect that the Monroe Doctrine should be excluded from the operations of the treaties but otherwise favored them. Senator Burton, President of the American Peace Society, to his everlasting credit, voted to accept the treaties unamended.

The arguments of the majority of the Committee on Foreign Relations can be reduced to two: 1st, the treaties are unconstitutional; 2nd, they "breed war."

The argument that the Senate's prerogatives are infringed and therefore the treaties are unconstitutional, we believe to be a mere pettifogging quibble. Senator Lodge, tho notoriously narrow-minded, knows better than that, as do all his colleagues who voted with him. We presented the arguments on this point two weeks ago in a very able article, by Prof. John B. Moore, generally regarded as the leading international lawyer of America. His article has already been used by Senator Burton in his minority report. This week, we print an equally authoritative article dealing with the constitutional aspects of the case from no less an authority than Governor Baldwin, of Connecticut, formerly Chief Justice of the State, and ex-president of the American Bar Association. He takes the same view. We only wish to add, as President Taft has said "that it is not disputable that the Senate may agree to arbitrate a class of questions in advance of their arising in the future." Take extradition or reciprocity treaties for example. In these treaties the Senate does not claim that every requisition for the extradition of a murderer must be referred to them for a decision, while in some reciprocity treaties, the President has even been allowed on his own discretion to fix certain rates. Governor Baldwin's further examples show the utter absurdity of the Senate's "constitutional" objections. Surely the Senate does not mean to claim it has no power to make general treaties?

Senators Root and Cullum agree that there are no constitutional objections to the treaties, but they come forward with amendments excluding the Monroe Doctrine from their scope. If Mr. Root thought this might tend to conciliate the recalcitrant majority there may possibly be some excuse for his action. Nevertheless Mr. Root is too large a man to have put himself in apparent opposition to the treaties by coming forward with a trivial objection at this critical moment. On our own invitation we have now got England and France to agree to settle all disputes with us hereafter by law instead of war—one of the greatest feats of statesmanship in the history of the world. And most unbelieveable of all, Germany has just announced that she too will enter into a similar treaty. It is furthermore understood that Japan is only waiting for the proper moment when she too will ask to enter this League of Peace. With these five nations accepting the principal of unlimited arbitration, it does not make any difference whether the rest of the world accepts or refuses it, for the reign of international peace will be already inaugurated. And yet just at this very point, Elihu Root, the President of the $10,000,000 Carnegie Peace Endowment, interposes an amendment. He does not know whether England and France will object; he cannot be unaware of the power of the great reactionary party in Germany which may scoff the nation back again to militarism at any moment. Yet he offers an amendment, as he did to the Canadian Reciprocity Treaty. Even if a Senator thinks the treaty not perfect, even if he is sure it may be defective in some point or other, he should waive all such objections, lest the shame of defeating these treaties be laid at his door. No amendment that can now be offered is worth the risk of defeating the treaties.

There is only one question in our opinion before the Senate, as we pointed out two weeks ago, and that is, are we yet ready to settle all disputes with England and France by arbitration?

Senator Lodge professes to fear that the treaties might actually "breed war," because England or France might insist on arbitrating the Monroe Doctrine or the question whether we have the right to exclude immigration, etc. What does the great State of Massachusetts, the cradle of the modern peace movement, say to such casuistry on the part of its representative? The doctrine that the peace treaties are disguised war treaties is enough to make even the injudicious grieve. To say that the Monroe Doctrine would be brought to arbitration is as foolish as to say that England would claim that the Declaration of Independence has no legal standing or that France should demand back Louisiana. England and France are not entirely crazy. But supposing for argument's sake, that England should claim the Monroe Doctrine has no standing in international law and call upon the United States to submit the question to The Hague. Then what would happen?

The United States would not admit the claim. England would call for the Commission of Inquiry, consisting of three members from both sides. This commission of six would investigate the case. It goes without saying that the three American members would be guided by the State Department at every stage of the negotiations. It is inconceivable that two out of the three commissioners would side with the three English commissioners and thus send the question to arbitration. Moreover, the Monroe Doctrine, as President Taft has declared, is not a justiciable" question. Still, if under all these circumstances the Commission should unanimously or by five out of six votes order the Monroe Doctrine to be arbitrated, then we believe the American people would say, let it be sent to The Hague, tho even then the chances would be that the decision would be in our favor. The contingency, however, that such a case would ever come to trial is a risk that will not disturb the sleep of the average American citizen who has the normal use of his reasoning faculties.

Similarly with respect to the exclusion of immigrants, it is an accepted principle of international law that a country may allow to come to its shores any class of people it chooses. Its right so to do is no more the subject of arbitration than its sovereignty or territorial integrity. Some Senators even have exprest the fear that the repudiated bonds issued in the reconstruction period might be brought into court despite the fact that the treaty affects cases *hereafter* to arise, and not those already having arisen.

It is such arguments as the aforementioned that incline us to believe that the Senatorial opposition to the treaty is disingenuous to say the very least. It is usually unwise to impute motives and impossible to prove them, but if asked to give our personal opinion as to the reasons for the Senate's present attitude of hostility, we should say that the Senate was actuated to a small degree by conservatism and to a large degree by vanity and jealousy. Senators find it convenient in obtaining patronage for themselves and their constituents frequently to "teach the President a lesson," even tho the peace of the world hangs in the balance.

Now what is to be done? It is certain that no time should be lost in demonstrating the sentiment of the whole country for the treaties. First of all it is the duty of President Taft to carry the fight to the people. He is in the right. His voice goes farther than any other man's. Let him lead. The country will follow. Then for all history it will be Washington, Lincoln and Taft. We are glad to believe the President realizes his opportunity and duty.

Next let the peace societies arouse themselves from their present inactivity. The American Peace Society has already upheld its time-honored record of unflinching courage and force thru the vote of Senator Burton and the steadfast stand of *The Advocate of Peace*. The World Peace Foundation of Boston has obtained resolutions from over two hundred chambers of commerce representing municipal populations of over twenty million people. Let it get similar resolutions from the bar associations, churches and labor unions. The New York Peace Society was about to organize the country for peace, last spring, when it was called off by Washington. Let it from now on follow its own best judgment. The Carnegie Peace Endowment has not yet got fully under way. It will never have a nobler opportunity, however, to show its statesmanship for peace than in the next four months. The Society has just called some fifteen of the world's leading economists to a Peace Conference at Berne, Switzerland. These economists have had all their expenses paid and been given each in addition an honorarium of one thousand dollars. They propose to study war scientifically. We have only the highest praise for this inaugural work of the Endowment, yet we now say to the twenty-eight trustees that the treaties with England and France will be worth a thousand times more to the cause of peace than all the tomes that all these subsidized economists can write in the next twenty years. We hope President Butler, the director of the Department of Intercourse and Education of the Endowment, will hurry home from Europe and assume the leadership in organizing the peace sentiment of the country. If the trustees do little or nothing now for these treaties, they will have betrayed the

founder's confidence in them, for Andrew Carnegie, more than any other private citizen, deserves the credit of first seeing the significance of President Taft's epochal utterance in favor of arbitration and bringing it to the attention of the world.

But whether the Carnegie Endowment leads in this glorious movement or not, the sixty-five other peace societies in the United States should now sieze their opportunity. Its like may never come again.

Finally, let every church in the land work and pray for the treaties. Not since the Prince of Peace died on Calvary, to make men free, has there been such an opportunity before it to show to the world the sincerity of its professions. Let every body of workingmen, every labor union and every grange pass resolutions in favor of these peace pacts. They at least know who are the ones who bear the sufferings of war and pay the taxes of armed peace. Let every chamber of commerce and board of trade urge a Senator to put peace above prerogative and perquisite and ratify these treaties. Peace is the greatest of all economic blessings. The producer of wealth has nothing to gain by war. Let every man, woman and child join in this crisis with united effort to save the treaties. We say to each one of them: Use your influence with prominent men. If you know a Senator, write to him and put it on his conscience. Can you help get your State Legislature to pass a resolution? Have you any influence with a chamber of commerce, or a labor union? If your paper publishes a good article on the subject, write an appreciative word to the editor. If he publishes nothing or writes cynically write him too. Talk it over with your friends. There are only a few months for action. You are working for your old age, for the welfare of your children, for generations yet unborn, for the Kingdom of God, for the Prince of Peace.

## The Fascination of Baseball

WHAT is it that draws to the diamond every fine afternoon a hundred thousand or more Americans? What is the secret of the permanent popularity of our national game? Ping-pong arises and vanishes. Archery flourishes and disappears. Roller skating rages and dies out. But baseball, year after year, retains its unchallenged sway over that most capricious of kingdoms, the American public. Even professionalism cannot kill it. What other game would stand the management of close corporations, the selling and trading of players, the immense sums of money involved, the pressure of popular feeling, and yet remain so clean and incorruptible? Imagine what football would become under similar conditions, since not even the protection of the amateur spirit and the shelter of college walls can keep it free from reproach.

The openness of baseball saves it from suspicion and the grounds for suspicion. Every player is at all times visible, and the game has 10,000 umpires. Each man has his own reputation to sustain as well as that of the team, and he knows that every error and misplay is scored up against him at the end of the year and mars his future fortunes. If it was suspected that there was collusion and prearrangement popular interest would fall off at once. For the reason why a game has a fascination far above a mere spectacle is because of the uncertainty of its outcome. A military parade, an exhibition of gymnastics or a pageant may be beautiful, but it is lacking in the excitement of the unpredictable. Each actor in such a performance knows what he is going to do and we know that he knows what he is going to do, consequently our interest is limited to the way he does it. It is not so exciting as flipping a penny into the air. Nobody in all the world knows which side of the coin is going to be uppermost, so we can enjoy on a small scale the sensations of a Columbus or a Galileo, the delight of penetrating into the unknown for ourselves. In reading a novel or seeing a play our enthusiasm is chilled by the realization that its apparent spontaneity is all an illusion; that, tho we do not know how it is coming out, somebody does, and we are jealous of his superior knowledge.

With life it is different. Its plot is unwritten, or at least unreadable to human eyes. And a game is interesting in proportion as it resembles life in its un-

certainty. The fatalist may say both of life and its mimic:

"The Ball no question makes of Ayes and Noes,
But Right or Left as strikes the Player goes."

But what tho the ball is as inexorably controlled by physical law as the planet, its motions are mysterious to us, and therefore fascinating. It does not matter how shallow a well is so long as we cannot see to the bottom of it.

But it is not enough that the game should be undeterminable by us; we must have a personal interest in it. We must have something at stake. This desire to share in the risks and hopes of one of the contending parties leads to the staking of money. But fortunately the great majority of the spectators do not resort to such a base expedient to enhance their interest. The true enthusiast stakes something more valuable than any monetary wager, his feelings and convictions. He throws his heart into the balance. The connection between the professional clubs and the cities whose names they bear is so slight that local patriotism has little power, but a certain partisanship is imperative to the full enjoyment of the game. He that does not choose a side from the moment the first ball is pitched and follow every play thereafter with wish for its success or failure is unworthy of a seat on the bleachers. Let us not smile when we hear the summer girl ask her escort, as they take their places, "Which side are we on today?" This is one of those sensible remarks which men call foolish simply because they are too frank for masculine taste.

The reason why baseball appeals to men more than to women is probably because they can identify themselves more fully with the players thru their own experience. To appreciate painting one must have had a brush in his hand. Most of the men who are watching the game know how it feels to gain a base or to have the ball leave the bat without quiver or tingle. They can therefore endow the players with their own former emotions, altho to the poor professionals it is doubtless merely a part of the day's work. Some psychologists have claimed that the innervation of the muscles which accompanies the emotional observation of such activity does in fact give exercise to the spectator, so that he is practically taking part in the game. But we are somewhat skeptical of the value of such vicarious exercise, and hold to the belief that the best baseball is played on vacant lots in cities and towns, where the only spectators are the seven or eight who are waiting their turn at the bat.

But it is undeniable that professional baseball owes its fascination largely to the spectators. It is more correct to say the game is interesting because crowds come to see it than to say that crowds come to see it because it is interesting. Anything at which ten thousand people are looking is worth looking at. Our pleasure is multiplied by the number present. Who would care to see the game if he were the only person on the grandstand? King Ludwig of Bavaria used to have operas performed before an auditorium empty of all save himself, but King Ludwig of Bavaria was a crazy man.

The ball is the oldest of human playthings. Froebel had historical justification for making it the first of his kindergarten toys. In the childhood of the race we see it depicted on the monuments of Egypt and Chaldea, and it has never been out of the hands of any generation since. But in baseball the game seems to have acquired a perfected and permanent form like chess, and requires only minor modifications from time to time as some one of its factors becomes unduly developed. At present the pitching seems to have got the better of the batting, and something may have to be done to give a chance for more scoring, as a few years ago when the power of the pitcher was curtailed. The value of the game depends upon the maintainance of the equal balance of the teams as they alternately act on the offensive and defensive. These eighteen alternations keep up the uncertainty till the last, and the interest is continuous and cumulative, in this way surpassing cricket, which has two interminable innings. Then, too, it is superior to other field sports in the variety of its activities and in the combination of teamwork and individual initiative.

The rotation of players prevents un

due specialization. Every man must be able to catch, throw, bat and run. At any moment the responsibility for winning a game may devolve upon any member. This is in accordance with the democratic principle of American life and government. We may have failed to develop a national art or music or literature, but we have developed a national game and we are proud of it.

## Dealing with the Dregs

It would not be easy to find a finer example of social philosophy than is exprest in the comment in *The Jewish World*, of London, on the astonishing outbreak of mob violence in Wales against the Jews. In various cities and towns the Jews were attacked even in their own homes and brutally beaten. They fled in terror, leaving their belongings to the infuriated rioters. The better citizens are astonished and shocked at the outbreak and it has been speedily suppresst; but while it lasted it was violent and bitter, much like a judenhetze or pogrom in Austria or Russia. It is clear that the charges against the Jews were mainly unfounded. They had to do with rentals, in large part, and doubtless there were cases of inhumanity which gave color to the attacks.

*The Jewish World*, while denying the main substance of the charges against the Jews, yet allows that there are dregs in the Jewish population as in every other. The Christian dregs exist in Great Britain as well as in Poland or Rumania, and may be stirred up to violence with the cry "Down with the Jews." But it adds that the Jewish community is popularly judged by its worst members, and it therefore behooves the Jews themselves to deal drastically with such members as continue to be a menace to the community as a whole.

We seem here to have the exact parallel to conditions in our own country. We, too, have a class of people called negroes, the most of whom are hard-working and fairly honest people, a valuable element in our population. But there are dregs among them; and it is these dregs, their indolence, violence and crime, that endanger the whole of their race among us. The whole race is too often judged not by their best, or their average, but by their worst members. A case of murder or rape, committed by one of the dregs, stirs the community of white people, and the mob attacks all alike, good and bad, clear spirit and dregs. The passion rises suddenly, flames angrily, and after the wrong is done the decent and worthy citizens learn of it too late to prevent and perhaps unable to punish.

Now the lesson which *The Jewish World* reads to British Jews, that they should deal drastically with their worst members, is what needs to be read to our American negroes. Let them deal drastically with their drunkards, their hoodlums, their criminals. They should be in haste to give them all the law allows them, the full jail sentence. They should help discover and then accuse them to justice. Better than this, they should put upon them all the pressure of social ostracism. They should make a sentiment that excludes and secludes them; and then they should add all the power of Christian influence. We do not like it when we hear that in certain elections the bulk of the negroes have voted with or for the saloon. It gives them a bad name. It implies that the dregs are in the majority. We hear it said that negroes are politically venal, even corrupt; that they sell their votes, just as some white men do. If this is a negro vice then the negro pulpits and the negro journals should denounce the guilty ones, even by name, if possible, and negro good government associations should ferret out those who thus disgrace and even endanger the whole race. There is not enough of this done.

And there are white dregs, even altho their crimes do not endanger the stronger race to which they belong. The mob that the other day burnt a man alive in Pennsylvania, a black man, were of the lowest dregs of their race there. Because we do not want such madness of criminality to spread we should, as advised by the Jewish editor, deal drastically with such brutes. They doubtless do not know they belong to the dregs—such people never do. They are often described as "the first citizens" of the

place; but dregs they are, the vilest dregs. Call them by their right name. Deal with them drastically. We build prisons for such. We also build reformatories and churches.

## Not a Typical American

We hasten to protest against the latest generalization on the subject of "the typical American." We object, in the first place, because the typical American is yet in that unformed stage in which Topsy was before she had "grown." And we object, secondly, because in most instances the writers who discourse about things "typical" quite obviously do not know what "typical" is, and would never identify the typical American if they should happen to live until he is evolved.

To characterize as a typical American the lady who instructed the Equity Court at Washington last week that $67 a day is the lowest figure on which a millionaire's wife can live properly, is to be sulfitic at the expense of truth. Whatever else it may be, a "type" comprehends a plurality of the instances observed and classified. Millionaires are not yet a plurality of Americans, and, unfortunately, there is no evidence that they will be for at least a generation or two to come. The only ground, then, on which the Washington lady could be regarded as typically American would be that of the distribution of her monthly allowance among the various items of her expenditure, and not that of its magnitude.

Look, then, at madame's monthly budget. Here are the items in order of size:

Marketing, groceries and wine, $250; clothing for herself, $200; auto, livery and chauffeur, $275; servants, $242; rent, summer cottage, $110; rent, Paris apartment, $110; traveling, $50; physicians, $25; cleaning clothes, $20; drugs and toilet articles, $20; pew rent, $16; music, $15; charity, $15; flowers, $15; taxes on Paris apartment, $15; theater tickets, $10; silver insurance, $8; massage, $5; dentist, $5; sewing club dues, $3; books, $2; miscellaneous items not specified, $54; total $1,012.

It is easy to see why the disloyal American, or the writer who is willing to be more sarcastic than accurate, should call this budget typically American. To superficial observation, motoring is more popular in America than the intellectual life, and a sour disposition may like to believe that the ratio of $2 for books to $275 for auto, livery and chauffeur is typical. Nevertheless, it isn't. It is characteristic of millionaire families and social strugglers only. Other families, even in these days of Carnegie Libraries, spend more than one one-hundred-and-thirty-seventh as much on "best sellers" as on motoring; the joy riders perhaps excepted.

But this is a minor criticism. The foregoing budget becomes wholly unrepresentative when we examine the items of rent, religion, charity and the theater. Statisticians tell us that in America, as in other countries, the average expenditure for rent is approximately one-fifth of income. Now here is a lady of such thrift and prudence that she spends for rent, including taxes on a Paris apartment, only a little more than one-ninth of her income. If all of our citizens followed her example, what would become of our real estate interests? We do not know what the total expenditure for theaters, or for churches or charities, is in the United States, but in New York City, if *World Almanac* figures may be accepted, the maintenance of theaters costs almost exactly the same amount as the maintenance of churches. Think, then, of a well-to-do lady who bestows upon church and charity almost three times as much as upon the theater!

Clearly, it is not as a picture of the economic life of a typical American that this budget is significant. It is useful, rather, as showing why and how a minority of Americans get ahead and become "respectable," while a plurality of us work for the minority and pay rent to them. The ruling passion is strong, not only in death, but also in prosperity, and when a woman who is able to live on a scale of $24,000 a year can keep her rent bill down to approximately one half of the rent bill of other people and her book bill down to $2 a month, we can make a pretty shrewd guess as to why she has that income to expend when the typical American hasn't.

## A Landmark in English History

August, as the calendar reminds us, is a month of thirty one days. Henceforward it will be recorded that not since English history began was there a month of greater or more far-reaching developments than August, 1911. Certainly no month in any year since the Revolution of 1688 witnessed more epoch-making political changes for the English speaking world than were crowded into the thirty-one days of the month just at an end. For British history the deprivation of the House of Lords of its veto over measures passed by the House of Commons, followed as was the Lord's Veto Act by the revival of the payment of members of the House of Commons, establishes a new date line. Hereafter the session at Westminster of 1911 must stand out as a landmark of as much constitutional and social significance as the Revolution of 1688, the Declaration of Independence of 1776, or the Reform Act of 1832.

These are the great date lines in the history of the English-speaking race since the Reformation; and the defeat of the Lords in the long-drawn-out struggle that began on the budget of 1909 will rank with them in importance. At the Revolution of 1688 a constitutional as distinct from an arbitrary monarchy was established, and an end was made to the Tory doctrine of the divine right of kings. But the Revolution brought loss rather than gain for democracy. Democracy, in fact, was scarcely conceivable in those days; and with the establishment of the crown on a constitutional basis, there began in 1688 the rule of the governing classes—a rule much worse for the common people than that of the most arbitrary king ever on the throne of England. From 1688 to 1832 the governing classes were supreme; and by their use of their power there were developed the appalling social conditions which marked the history of the people of England from the beginning of the reign of George III until the first extension of the franchise to the artisan and laboring classes in 1867. These conditions, directly due to the selfish use by the governing classes of their power for their own political, material and social aggrandizement, are even yet, in this memorable year of British history, obviously responsible for the deplorable poverty of millions of the wage earning classes in England. They account, moreover, to a large degree for the widespread uprising of labor in England in August, 1911—a successful revolt which must stand out in history as prominently as the defeat of the Lords.

Part of the power which the governing classes had so relentlessly and arrogantly used for their own aggrandizement, and for the economic and social depression of the common people, disappeared with the sweeping reform of the electoral system in 1832. Part of what remained was lost by the extension of the franchise in 1867. Still more disappeared with the extension of the suffrage to all the laboring classes in 1884; and there was again a loss of power for the governing classes when, after the great democratic victory at the polls in 1906, Whigs of the territorial aristocracy were no longer permitted to dominate Liberal Cabinets as they had done from 1832. But when the governing classes at four well-marked stages in English history were deprived of direct power over the House of Commons and over Cabinets of both political parties, they began to rely on the House of Lords. The governing classes had comparatively little need of the House of Lords so long as they were supreme in the Cabinet. This supremacy, so far as Liberal Cabinets were concerned, came to an end in 1906; and for the governing classes, by this time almost exclusively Conservative, the House of Lords then began to have a quite new importance — an importance, however, that could only be temporary, unless the English people were pusillanimous enough to surrender at a stroke all that they had slowly and toilsomely gained of political power from the American Revolution to the end of Queen Victoria's long reign.

The new and continuous use to which the House of Lords was put after 1906 was to safeguard the political, material and social advantages that the governing classes had drawn to themselves between the revolution of 1688 and 1867. The House of Lords, in fact, fell in

August, 1911, not in defense of any constitutional principle, but in an endeavor to preserve the peculiar privileges and exemptions, as regards taxation of land, that the governing classes had drawn to themselves in the century and a half in which all political power was in their hands. The Lords went down to a graceless defeat on a sordid pounds, shillings and pence issue—on a miserable attempt after exemption from taxation. If democracy had been able to name the issue on which the struggle impending since 1832 should be fought, it could not have made a more advantageous choice than the Lords made for it. It was not a dignified issue for the Lords, and there was no dignity on the part of the Lords in the fight that went on from November, 1909, to August, 1911. The privilege for which the Lords entered upon the struggle was lost at the election in January, 1910. In the further struggle, victory of democracy was as assured as was victory for the Parliamentary reformers of 1832, when the governing classes made their first stand for control over the House of Commons that they had drawn to themselves when they made an end of the Stuarts and imported a new dynasty from Hanover.

This new date line of August, 1911, means that democracy in England, after a struggle that began as a direct result of the American Revolution, has pushed the governing classes from a vantage ground held since 1688, and thereby cleared its pathway for advance. It was historically appropriate that the revival of wages for the members of the House of Commons should also come in August, 1911; for it was largely owing to the breakdown of Parliamentary wages in the fifteenth century that the governing classes were able to secure control of the House of Commons after 1688. Lecturers score the men who broke down the system under which each community paid the wages of its representative in the House of Commons. They were the men who went to the boroughs cap in hand and said, "Elect us and we will present no bill for wages", and it is noteworthy that now when wages are revived, and are to be paid not as of old out of local funds, but out of the imperial treasury, lawyers will be almost the only men who will suffer from the changes that will follow this reform of electoral economy of August, 1911.

**Leonardo's Lady**

Enigmatic, ineffable, mocking, sad, subtle, haunting, mysterious, consumptive—these are a few of the adjectives applied by æsthetes and others to the smile of La Giaconda. And if there is anything in the theory that a love-sick pervert—"blond of hair and blue-eyed, belonging to one of the North European races"—eloped with her to his Paris garret, to feast his eyes in private as he had long done publicly in the Salon Carré of the Louvre, if there is anything in all this, we say, then lunacy as well as adjectives has been inspired by the famous portrait. But we hope that it has not fallen into a madman's hands—for the world would be the poorer if Leonardo da Vinci's masterpiece was destroyed. Pater wrote renowned prose about La Giaconda—or Mona Lisa, as we Anglo-Saxons call her; Oscar Wilde once took a shy at Pater's pretentious interpretation; almost every art-critic has had a fling at her, to prove his mettle, just as every actor rehearses Hamlet to his looking-glass. In a Braun print, or a student's copy, scarcely anything about the composition is remarkable. The charm, the mystery of that smiling face altogether defies transference to sensitive plate or blank canvas. Leonardo caught it—Vasari tells us that he set musicians near the lady when she sat, that their sweet music might induce that wonderful smile. Leonardo caught it—but he probably never realized how much twaddle would be written and spoken about his great achievement. The British Government once offered $5,000,000 for the painting, and France refused the offer. But the French Government, or its official representatives, have been careless in guarding the treasure. That some one found it possible, early last week, to remove the heavy wooden panel from its frame and then to make off with the panel, is almost beyond belief. A cynical newspaper published in Philadelphia of all places—remarks that, if the Paris police are vigilant, they can prob-

ably arrest the thief when he comes back to steal the Louvre itself. But such a crime as this should be prevented, not punished. Will there be an interpellation in the French Parliament? Ministries have fallen on less provocation!

**Affirmative Politics**

A correspondent of the New York *Tribune* writes of Sir Wilfrid Laurier that it has, of late years, been a part of his good fortune "that his opponents in all their campaigns have occupied a negative position," coming before the electors with criticism, often excellent criticism, "but never with a straight-out, affirmative, constructive policy." It is a singular fact that when the particulars of the reciprocity agreement were first laid before the Dominion Parliament, the Opposition leaders were, as it were, dazed, while Conservative newspapers began by supporting the agreement. Indeed, some of the Conservative candidates still do support it. And well they may, for Sir John Macdonald himself, the late Conservative leader, was a stout supporter of the reciprocal policy. But to extend our quotation:

"Sir Wilfrid's forty years of public life have firmly convinced him of the truth of Lord Bacon's observation that mere negation has never disturbed the peace of the world. So it is that his political career is full of affirmation, and the present campaign [in which reciprocity is the chief issue] is the one supreme illustration of this fact."

Affirmation rather than negation is almost always the popular policy. Mr. Roosevelt has proved that. He has had the knack of expressing even his negations in positive form. In the science of advertising it is a truism that negative publicity is almost valueless. And there is a good deal that is common to advertising and to modern politics.

**City Farms**

Chicago has adopted a system of farming its vacant lots under the superintendent of the City Gardens Association. This official has chosen, as a model city farm, a lot 40 by 150 feet. For such a farm the tenant pays a dollar and a half rent, and almost invariably makes sufficient income to induce him to keep at the tillage. The superintendent suggests to all applicants ten rows of potatoes, four rows of tomatoes, with lettuces and radishes between them; then six rows of cabbage, five rows of sweet corn, four rows of peas, four rows of beans and five rows of onions. He has four hundred families at work in the fields near the International Harvester works, and he has turned over the land lying near Fortieth street and Langley avenue to be superintended and directed by All Souls Church. Other gardens cover some twenty acres, here and there about the city, and all well tilled. The superintendence is in most cases volunteer, but the general management costs about $2,000 a year. The object is to create the very largest amount of produce from the very smallest area of soil. It is intensive farming illustrated in the city. The exact number of farms we do not find reported, but it runs up into the thousands. All the families represented get a good supply of vegetables and in some cases small fruits for their home use, and the average yield for market is above $30. It will be difficult to find any other of our ameliorating movements working more substantial results. Not the least must be counted the advantage that accrues to the health of tenement dwellers from work in the open, especially the work that is done by the superannuated who have no other recreation.

**Blooming Railroads**

Every railroad in the United States and Canada will replace its right of way fences with flowering hedges if plans of the Railway Gardening Association, which opened its fifth annual convention yesterday, are carried out. R. W. Hutchinson, landscape gardener of the Pennsylvania lines, known as the "Father of Railway Gardening," advocated the floral hedge, and his sentiment was endorsed by the convention.—*Press dispatch.*

Not many commuters go so far as Mr. Bok, editor of the *Ladies' Home Journal* and enthusiastic horticulturist, who first secured official permission and then planted, at his own expense, a row of rosebushes that extends to the next station below and above his own stop on the Pennsylvania main line, but suburbanites everywhere will hail with joy the news that the right-of-way thruout the

land is to bloom in the spring. Next let us abolish cinders, please, and we shall all move into the country—whatever becomes of our businesses and professions.

**International Agriculture**

The International Institute of Agriculture has passed the initial period and is beginning practical work for the people by collecting statistics of the crops from all quarters of the globe, and it will make these statistics available to direct trade and prevent speculation on inadequate data. The delegates of forty-seven governments have just attended the last session of the General Assembly, under instruction to formulate a regular crop-reporting service. Responses are received not only from such leading nations as Great Britain, Germany and the United States, but China reports herself as anxious to co-operate. The Minister of Agriculture writes to the president of the institute that he regrets his inability at present fully to meet the desires of the institute, as China is only now beginning to organize bureaus and agricultural associations in the several provinces. Australia responds with a full report, and Japan notifies the institute that a Commissary of Agriculture has been appointed, with the special duty of crop reporting. This indicates the spread of international fellowship and co-operation as resolutions of good will could not do. As a consequence the institute at Rome has collated all the material at hand from the different governments, and sends out a world summary. Such a summary will be as important to the smaller countries as to the larger ones, and will become authority everywhere. The secretary of the Board of Trade of Chicago responds that the report will be of incalculable benefit in lessening the fluctuations of prices; in which he is seconded by the Liverpool secretary, who announces that it will be of supreme importance to the commercial and industrial world. We can hardly fight each other after we have begun to shake hands in business affairs. The next step should be an international board of trade, free from the speculative element and based on the careful summary of international reports. That international currency and weights and measures will follow we may be sure. The lines that divide us are fading. Races are fusing. The human family becomes a possibility.

**Babies**

The *Survey* calls our attention to the needless death of babies in our large cities. The present summer, with its tremendous heat, has made the slaughter worse than ever. Notwithstanding the local provisions for relief, there is nothing in sight as yet that shall prevent this sort of unnecessary death rate in the future. Dr. Rowland Freeman insists that where babies are well cared for and properly fed, only one in one hundred and fifty dies during the first year of its life. But of children born in New York City, at present, one in seven dies before it has seen its first birthday. Providing pure milk is certainly very commendable, but Dr. Woods Hutchinson suggests that cow's milk, while admirably adapted for raising calves, is a very poor thing for raising babies, and the substitutes are worse. Evidently what we need is a thoroly reformed method of meeting this increase of humanity at the outset. Babies cannot be set to sleep in dark rooms, with any expectation of their living to know the wrong that is done them. In addition to fresh milk there must be fresh air, and plenty of sunshine. Perhaps Senator Owen's bill to establish a national Department of Health was right. It is not the babies alone who need provision against these torrid waves that every summer roll thru our cities and carry off victims by the carload. It is a shame to our civilization when we read that even equine victims of heat were ten thousand.

**Canadian Prisons**

Dr. John Handley, who was commissioned by Governor Wilson, of New Jersey, to visit the Canadian prisons, reports that the prison system of our neighbor is far ahead of our own. Each prison has a large farm attached, where at least one half of the prisoners are regularly at work. There are no walls surrounding the prisons, no regiments on guard; and yet in two years' time only five prisoners have been

attempted to escape. The Canadian idea seems to be that a State prison should be a custodial school, and that it should attach no special disgrace to any young man or boy who has broken a law, and thus come under condemnation. A Canadian authority adds that penning up ordinary offenders is out of date. Both prison reform and humanity forbid it. It degrades instead of lifting up, while to garb men in costumes to be stared at by all who see them at work degrades them beyond recovery. As a rule those who are arrested and temporarily confined are fairly good citizens, not by any means hopelessly degraded; but having once worn prison garb they are outcasts for life. A prison farm works well. There is a moral value in working on the soil. The latest Government reports show that prison labor of this sort is most effective. It has about it nothing degrading, but to most men it is associated with a special degree of freedom.

We judge that it is because complaint has been made that Catholic authors are not properly represented in public libraries that the Carnegie Library of Pittsburg has issued a classified list of books on its shelves by Catholic authors. One would hardly have thought such a catalog necessary, but the preface explains that it is prepared "for the benefit of those who do not feel sufficient confidence in their own knowledge to select these from the card catalogs." That is, it is for those who are afraid lest they wander in their reading out of safe limits. Yet some of these books we observe have a tinge of Modernism. May it be long before there is call for a catalog of books by Presbyterian, Lutheran or Protestant authors. The list contains about 700 names of authors and about 1,700 titles.

A brakeman replied to a bachelor of arts, when the latter asked him to "lend" a match for his cigar: "I can't *lend* you a match, but I'll be glad to *give* you one." It was a courteously phrased and entirely proper correction. We would be better off if more of our bachelors (and more of our married men besides) were this brakeman's equal in precision of speech. Petty corrections are frequently in questionable taste, and do not wholly make for popularity, but the right word is always welcome in the right place—and it isn't always a slang word, either.

The Portuguese clergy are likely at last to accept the terms of the republic. Already 1,200 of the 6,000 priests have asked to receive the stipends averaging $550 a year offered to each priest; but none of the bishops has ventured to disobey the orders of the Vatican. They are not as needy as the lower clergy. Many more priests are expected to make application. The chief anxiety now is as to the Royalist campaign, which has been long threatened but does not seem to materialize.

What more could be expected, when each man and each State looks out selfishly for itself, than that the membership of the lower House of Congress should be increased from 391 to 433, quite too large a number to do business effectively without as severe rules as were initiated by Speaker Blaine and were condemned under Speaker Cannon. But no State was willing to reduce its representation, and so the growing States add forty-two new districts and members of Congress.

Virginians object—and we do not wonder—to a school history which tells too much truth about the evils of slavery, particularly as to its socially corrupting influence. We might as well try to forget the sins of our ancestors and not tell our children what they were. If Washington did swear, do not put it into a school book; leave that for "Notes and Queries."

At the meeting in Louisville of the Southern Presbyterian Church there were referred to a special committee some complaints against the Catholic Church and one against President Taft for appointing a Catholic as Chief Justice. A humorist suggests that it must be that our Unitarian President is a Jesuit in disguise.

# Insurance

## National Insurance

Our readers who are interested in national insurance of workingmen will find in the *Survey,* of August 5, the brief for its constitutionality presented by Miles M. Dawson, Esq., at the hearing before the federal liability commission. Aside from the question of constitutionality, the arguments for the general excellence of national insurance for industrial accidents are, first and foremost, that it "does the work." That is, judging from the German experience, it prevents the possibility of poverty following upon death or loss of earning power by providing for the sufferer's family. This it does (judging from the British experience) more satisfactorily than a system of automatic compensation. Also, the German system starts with a low premium rate, which increases gradually, whereas the introduction of automatic compensation causes an enormous and permanent rise in the rates of industrial insurance companies.

Within a month, Wisconsin has passed a law establishing state life and old-age annuities, a state board being appointed which is to issue policies not to exceed $3,000 to persons between the ages of twenty and sixty. Insurance is not in any sense compulsory. According to well-authenticated reports Italy also plans a system of state life insurance, involving pensions for old and disabled workmen. The government, which, in connection with workmen's compensation, supervises a mutual insurance fund in which all employers not insured elsewhere must insure, has introduced a bill providing that hereafter the government shall write all new life insurance business. This points toward the monopolization of such insurance by the state.

In a recent paper read before a medical association in New York, the ideal insurance risk was said to range from men 5 feet 7 inches to 5 feet 9 inches in hight. The greater the variation from these figures the greater the risk. Longevity is not as great in tall men as in short men. Men who are both tall and stout are poorer risks than men who are stout and of medium or short stature. Abundant muscular tissue over the chest and arms is a matter to be noted in the applicant's favor.

Chicago is planning to reduce its fire waste by annually designating one day to be known as Fire Prevention Day. It was first proposed to select October 9, the date of the great Chicago fire, but a movable date seems advisable, such as the first Friday in October. This would enable the schools to take part, and would prevent the undesirable event of the date falling on Sunday or Monday. The day would be devoted to exhibits and instruction in fire prevention.

In the cry against our enormous fire waste even President Taft has let himself be heard. In a recent letter to the National Fire Protection Association, he stated that much of the loss of life and property by fire in the United States was undoubtedly preventable, and that the extent and nature of our fire losses manifestly brought the question of the fire waste prominently forward in connection with conservation effort.

The Metropolitan Life Insurance Company deserves great credit for the work it is doing in free nursing. The system has now been extended to 260 cities. The company usually operates thru nurses' associations and has relieved much suffering and prevented many deaths. The average cost of the free nursing to each policyholder is less than one-fifth of a cent.

The amount of life insurance in force in the United States has increased from $6,500,000 in 1843 to $15,480,720,000 in 1910. We may deplore our backwardness in shipping and in some other industries, but in life insurance the United States leads by a substantial margin all other countries in the world.

# Financial

## Normal Crops

THE *Journal of the Royal Statistical Society* finds fault with the United States Bureau of Statistics because of the methods it employs in gathering and presenting its "normal crop" reports. As the International Agricultural Institute in Rome is now taking upon itself the issuing of comparative crop reports, it behooves all the contributing nations to agree upon some common and uniform basis of action, so that the reports can be made of comparative value.

At present the United States Bureau of Statistics defines a "normal" crop as follows: "A full normal condition is not an average condition, but a condition above the average, giving promise of more than the average crop." Says the *Journal of the Royal Statistical Society:*

"It is clear that a normal crop has no definite statistical basis, but must vary in the judgment of individual correspondents [of the Bureau]. Even if they assign a definite value in bushels or tons to the normal crop their estimate is very likely to be affected in one direction or the other by the degree in which one part of such a definition as that may have impressed itself on their mind more than some other part."

A further indictment of the Statistical Bureau is disclosed when a review of the figures for the past ten years shows that there has never been a normal crop in the country—the normal yields in the Government sense always exceeding the highest yields harvested in practice.

We think the criticism of our British contemporary well taken. Why should not the International Institute of Agriculture devise a model system for reporting the normal crops and offer it to the various governments for their adoption?

*

....The United States Mortgage and Trust Company announces that after next month no interest will be allowed on deposits of less than $1,000. Other trust companies have already adopted this rule.

....Last week James G. Cannon, president of the Fourth National Bank, and Vincent S. Mulford, head of the Jewelers' Circular Publishing Company, were elected directors of the Fidelity Trust Company of this city.

....John W. Gates, who died August 9, left a fortune of about thirty million dollars. This famous speculator began life as a farmer's boy, in Illinois. About a million of his fortune is distributed among friends and employees. The rest goes to his widow and son, Charles G. Gates. It is stipulated that none of the securities which form the bulk of the estate shall be sold within ten years.

....Monday was the final day for the deposit of the bonds and preferred stock of the American Tobacco Company. It is learned that between 49 and 50 per cent. of the stock has been deposited or pledged for deposit, and that a large amount of the bonds had also been turned in. An extension of time to September 15 for the stock and of thirty days for the deposit of the bonds has been granted. Application has been made to the New York Stock Exchange for listing of the deposit agreement, which, it is expected, will be favorably acted upon next Wednesday. An attorney for the American Tobacco Company says that it is probable that next Thursday the United States Circuit Court will grant an order directing that the reasonable expenses of the three committees be borne by the American Tobacco Company. As this question of expense has been objected to by some of the security holders, it is believed that the granting of this order will result in practically all of the bonds and stock being deposited. It is expected that substantial progress will be made in working out the dissolution and readjustment plan between now and next Thursday, when another conference of the Tobacco attorney with the Circuit Court will be held. It is intimated that after that conference it will be possible to make some definite announcement regarding the plan itself. Representatives of the Tobacco Company are apparently very well pleased with the situation.

# The Independent

VOL. LXXI NEW YORK, THURSDAY, SEPTEMBER 7, 1911 No. 3275

## Survey of the World

**President Taft and Senator La Follette**

The President's swing around the circle will take him into the "enemy's country." He will defend his tariff vetoes before the constituents of La Follette in Wisconsin, Clapp in Minnesota, Gronna in North Dakota, Crawford in South Dakota, Cummins and Kenyon in Iowa, Bristow in Kansas, Borah in Idaho, Poindexter in Washington, Bourne in Oregon, and Works in California. Since the delivery of Mr. Taft's speech at Hamilton, Mass., some of the insurgent Republicans have declared that they will be justified in not backing Mr. Taft for re-election should he be renominated. Senator La Follette, in his weekly magazine, has published an editorial article entitled "Taft: A Blow at the Consumer," and speaking before farmers attending the inter-State grangers' picnic at Williamsport, Pa., has avowed his desire to become President, and his ambition to inaugurate the government policies of which he is the champion. He urged the adoption of the initiative, referendum and recall, the latter to include judges. He declared the present system of government unrepresentative. Reciprocity and the tariff did not come in for discussion in his address. "The reason why the Middle West is making history today is because out of Pennsylvania, New York and Massachusetts the strong characters went into the Mississippi Valley forty or fifty years ago and laid the foundations for the citizenship which is now the most progressive in the world." He added: "Not many years ago, less than fourteen men controlled the capital of this country, but today I find that these fourteen men combined, who were a short time ago all-powerful, today dare not cross the path or thwart the will of two great names, Morgan and Standard Oil, and Standard Oil acknowledges the supremacy of Morgan."——A bureau organized to further the insurgent policies has been opened in Washington. W. L. Howser, a political lieutenant of Senator La Follette, and formerly Secretary of State of Wisconsin, is in charge. The organization is admittedly hostile to the renomination of President Taft. Senator Cummins is one of the insurgents to have declared in favor of the La Follette candidacy. "Taft," he says, "is out of harmony with the political views of the rank and file of the Republican party." Says the Washington correspondent of the Chicago *Tribune* (a La Follette organ): "Senator Cummins would rather support Senator La Follette than President Taft. . . . He may be a receptive candidate himself." The President and his advisers say they do not believe Mr. Cummins's endorsement of the Wisconsin Senator will hurt Mr. Taft's chances.——Champ Clark, Democratic Speaker of the House of Representatives, in replying to Mr. Taft's defense of his tariff vetoes, denounced as a "bald misstatement" the remarks passed upon the Democratic-insurgent tariff bills; also as an "ungrateful performance."

*

**Railroads and Strikes**

The big railroads of the country now employ fewer men than a year ago by 81,890. Statistics for 60 per cent. of the railway mileage show a cut of 9 per cent. in the number of employees. The cut is greatest in the case of maintenance-of-way men. The retrenchment effects a saving of $94,000,000 annually. ——The Southern Pacific is one of the

railways recently threatened with a strike. Conferences between union men and Julius Kruttschnitt, vice president of the railway company, seem to have diminished the danger. The Union Pacific declines to make the increases in salary demanded, "with the business of the country rapidly declining." Attention is called by the management to "modern sanitary devices" and other improvements made in the interest of its employees; and these last are reminded that "a pension system has been adopted for their benefit." Tho it has been reported that employees of the St. Paul are preparing to join the Harriman lines and the Chicago & Northwestern railway men in demanding union recognition, a new phase of the situation received attention when Mr. Kruttschnitt called the attention of Union and Southern Pacific employees to the pension system and, by implication, to the clause that only employees who have served twenty years *consecutively* are eligible to receive pensions. Other railways are holding conferences with the representatives of their men. But they bolt, in general, at "recognition"—and the Illinois Central is one of the railroad companies to come out flatly against it. Some of the Eastern railroads—including the Delaware, Lackawanna & Western—have been reported to be facing general strikes; the grievance being inadequate wages. As we go to press, the strike danger is gravest for the Illinois Central Railroad, which has refused to comply with demands made by the Federation of Shop Employees.——The new management of the Philadelphia Rapid Transit Company offers a plan of co-operation to its employees. This will give the carmen, by July, 1915, a maximum of 28 cents per hour, 2 cents more than the Amalgamated Union has sought to obtain for its members. Twenty-two per cent. of the gross passenger earnings of the company are to be paid out as wages. The men are to be interested in the economical and efficient running of their cars, improvements in rolling stock are contemplated, and receipts will, it is hoped, be increased. The company will deal with its employees thru the union if two-thirds of the carmen, voting by secret ballot, so will it. There will be co-operation committees, on which representatives of all the car barns will sit, in place of the grievance committee. But there are now two rival unions. It is essential, says the management, that one of these be done away with. The acceptance of the plan of co-operation is indicated.——The McNamaras, alleged bridge-dynamiters and accused of blowing up the building of the Los Angeles *Times*, were the heroes of Labor Day celebrations. In Indianapolis they were honored with a float. At Binghamton, N. Y., Frank Morrison, secretary of the American Federation of Labor, denounced the "kidnapping." In Los Angeles 15,000 union men and women marched to the music of the "Marseillaise." Forty thousand marched in New York. In Philadelphia, the labor leaders were too busy with politics to arrange a parade. The courts came in for denunciation in many of the Labor Day addresses.

**New York**

Governor Dix has made public a letter declaring that there is one question of paramount importance:

> "which should be acted upon affirmatively at the coming session of the Legislature, namely, the enactment of a suitable direct nomination bill. . . . The Rochester platform pledged the Democratic party to the principle of Statewide direct primaries that will 'insure to the people the right to choose members of political committees and nominate candidates for public office.' The Republican platform was hardly less explicit. The duty of fulfilling these pledges should rest alike upon all members of the Legislature, irrespective of political affiliation."

It is too late to pass a law to go into effect this year.——Madison Square Garden was jammed on the night of August 29 by a crowd which paid $27,000 to see Matt Wells, an Englishman, best an American boxer named Brown. Outside, in Madison Square, a large mob awaited the issue of the fight, which was held under the new Frawley law, which, after eleven years' prohibition, permits prize fights under State regulation. Rowdyism, extortion and violation of city ordinances are charged in this connection. No attempt was made to enforce the provisions of the new law, which prohibits gambling. A political issue may be made of the fight and its incidents.

**Various Items**

Paterson, N. J., has voted down the Walsh commission plan of municipal government by a vote of 7,984 to 4,917. The largest taxpayers supported the existing system. It was shown that the city had paid off a floating debt of $650,000 and reduced the bonded debt nearly $200,000, besides providing five new schools, including a high school, fifteen new parks and making other improvements. The citizens of East Rutherford, N. J., likewise voted against the commission plan. Somewhat earlier, Trenton adopted the plan, and on August 15 five commissioners were elected to supersede the "councils." Ocean City, N. J., has voted for a commission; Garfield, N. J., against it.——The grand jury which is investigating election law violations in Atlantic City, N. J., is still active, and recently returned sixteen fresh indictments. There is much delay in their hearing, however. Reformers are still trying to enforce the excise law at this place, and on August 30 obtained almost 200 warrants for alleged violations.——The charges of corruption and conspiracy brought against former Congressman Joseph C. Sibley, of Pennsylvania, have been dropped by the prosecution. The health of the ex-Representative from Warren County is exceedingly bad.——Gifford Pinchot and Senator Poindexter (Washington) are on their way to Alaska to investigate conditions.——Governor Mills, of New Mexico, has issued a proclamation calling for the election of two Congressmen, Governor, State and county officers, judges, and Legislature, November 7. This will be the first "State" election in New Mexico.——Great storms marked last week, and Charleston, S. C., had a hurricane. Eleven lives were lost in Charleston County, and damage to the extent of $1,000,000 was incurred. Much damage was done to shipping along the Atlantic seaboard.

**In Canada**

Tho there is no evidence that the Liberals are losing ground, the Canadian Opposition continues to be aggressively active. Sir James Whitney, Premier of Ontario, asserts that the reciprocity agreement was devised by the United States "to hamstring and kill anything in the nature of the concentration and consolidation of the British Empire." Sir James added that back in the minds of President Taft and his friends was the idea that Canada might one day form a part of the North American republic. "Canada is not for sale" is a catchword of the Conservatives. The Liberals are disappointed at the discreet opposition of the Canadian Pacific Railway, which has an almost incalculable influence, to the agreement. Sir Thomas Shaughnessy, president of the "C. P.," reminds his interviewers that the railway keeps out of politics; but he acknowledges his personal dislike of reciprocity. In Eastern Canada the argument is advanced that reciprocity will injure the business of the Canadian Pacific thru J. J. Hill extending branches of the Great Northern across the boundary. Meantime the Immigration Department has issued an official statement showing that the farmers of the Prairie Provinces have planted, in anticipation of the reciprocity agreement becoming a law, an enormous crop of barley and flax, and will be prepared to export great quantities of flaxseed and barley to the United States in the fall if the Government wins out.——Canada's customs receipts for July were $7,678,395, as compared with $6,479,795 in July, 1910. This is in spite of the falling off of English imports thru strikes.——Both Sir Wilfrid Laurier and the leader of the Opposition, R. L. Borden, were campaigning last week in Nova Scotia.——Sir Wilfrid Laurier will be a candidate in Soulanges, P. Q., as well as in Quebec, East. This is because the Liberals of Soulanges are in hopeless discord. If elected by both constituencies he will accept his old seat, and a bye-election will fill the other. This is an unusual procedure in Canada.

**Mexico**

The platform of the Progressive party, which has unanimously nominated Francisco I. Madero for President of Mexico, provides for the strict maintenance of the Constitution of 1857; pledges its candidates to oppose in theory and practice the re-election of themselves or their colleagues; provides for revision of the systems of taxation and the judiciary;

treaty, the development of public resources and of the educational system, and promises opposition to monopoly and special privilege. One provision is for an extension of the nation's friendly relations with foreign nations, "especially those of Latin America," "directing prudently the policy of government toward bringing about a union of the Central American republics." The nominating convention was the first ever held in Mexico, unless one counts the recent convention of the Clericals, but it was fairly orderly thruout. No other name than Madero's was placed before the convention.——By agreement the names of the candidates for the nomination for Vice-President had been drawn by lot to be discussed in rotation. Vasquez Gomez was the first name drawn. He was bitterly attacked by speakers. The candidate named finally was José Pino. ——Good roads and a strike arbitration commission are features of the platform of Gen. Bernardo Reyes, a rival candidate for the Presidency. He, too, is pledged against re-election and to various other reforms, including the liberty of the press and the trial of newspaper men by a jury of journalists, and that only after arrest by warrant. As a preliminary move against Madero, alleged friends of Reyes demand a postponement of the presidential election, claiming that the country is not yet settled enough for voting in October. Meantime, the acting President (Señor De la Barra) strains every effort to restore order, but without conspicuous success. General Reyes himself, when about to address a political meeting in Mexico City, September 3, was stoned by Maderists, and robbed of 3,000 pesos. Forty-three were wounded in the course of that one day's disorders in the capital. In Northern Mexico, where most of the fighting occurred during the late rebellion, soldiers of the Maderist army are bitterly hostile to the Reyes candidacy. Colonel Acosta, a Maderist, has declared a rebellion against the actual government. He was lately reported to have overpowered a small guard of rurales in the northern part of Vera Cruz, and to have gained recruits there. Governor Banderas, of Sinaloa, is in open revolt. The Federal troops have, however, defeated Zapatistas in several engagements. Fear of an uprising on September 16, the anniversary of Mexican independence, will result in the postponement of the usual celebrations. The Government has, too, taken steps to curb the Socialists. For libeling President Taft and the rulers of several European countries, De Lara, an active propagandist, has been imprisoned at Torreon. The consuls of Spain, Germany and the United States demanded his arrest.—— No action has been taken by our State Department looking to the pushing of claims of American citizens against the Mexican Government, for damages incurred during the insurrection. Already the Mexican Government has appointed a Domestic Commission, similar in purpose to the United States Court of Claims. Up to the present time the American State Department has been advised by some 500 American citizens that they intend to file claims against the Mexican Government. The Department will for the present confine itself to furnishing all information required.

**Food Riots in France**

The general and continued rise in the cost of food in France has upset the smaller family budgets, and the women, finding it impossible longer to make both ends meet, have resorted to force in order to bring down prices to reasonable figures. The movement started in northeastern France last week and spread rapidly thru the towns near the Belgian border, such as Lille, Cambrai, Valenciennes, Lens, St. Quentin and Dunkirk, while on the opposite side of France the Breton housewives have adopted similar measures. The women go to market in mass, bearing placards with the prices they are willing to pay. Visiting one dealer after another they present this ultimatum, and if one refuses to come to terms they force him to close his shop or else they loot it. These mobs range in number from 200 in the smaller places to 2,000 in the larger and are very difficult to control. Two squadrons of cavalry and a regiment of infantry, sent to the disturbed district to reinforce the police, found it difficult to restore order. No one has yet been killed, but in several instances butchers and bakers caught on the streets have been badly beaten. Many of the dealers

have signed the scale, but others, asserting that it is impossible to sell cheaper and make a living profit, have put up their shutters. Consequently it is impossibly to buy dairy products, meat and vegetables in some places. Where the farmers have refused to send their produce into town under these circumstances the mobs have extended their raids into the country, ravaging fields and sacking dairies. The demonstrations are assuming an anarchistic character, partly due to the participation of hoodlums and partly thru the influence of the Central Confederation of Labor, the center of syndicalism. The red flag is conspicuous in the processions and the "International" is the favorite song. As in this country, various explanations are given for the advance in prices, the tariff and the trusts being commonly charged with it. The prevalence of the foot and mouth disease among cattle has made the meat market short. The Government refuses to diminish the tariff on foreign meats and dairy products, but proposes to put on the free list mutton and vegetables from the French colonies of Algeria and Madagascar. The octroi or tax imposed on all produce entering a town is an important factor in the problem.——The Director of National Museums, Théophile Homolle, has been suspended on account of the stealing of "Mona Lisa." It appears from the investigation that the management of the Louvre was deplorably lax.——Two of the best aviators of the French army were killed on September 2—Captain de Camine, who was thrown to the ground from a hight of 600 feet thru the breaking of the right wing of his monoplane, and Lieutenant de Grailly, who was burned by the explosion of the gasoline tank setting fire to his machine while in mid air.——But the record for high flight has been taken from America by France during the week. M. Garros rose in a monoplane to a hight of 13,845 feet over the sea at Parame.

**Steuben and Hill**

At Berlin, on September 2, the German Emperor unveiled a bronze statue of General Baron von Steuben, who drilled the army of the Revolution. The statue is a replica of that recently placed in Washington, designed by Albert Jaeger. Congressman Richard Bartholdt, of St. Louis, special envoy of the United States, in presenting it as a gift of the American Congress took occasion to emphasize the peace movement, of which he is a leading advocate, in the following words:

"The Peace President extends to the Peace Kaiser under whose reign the phrase, 'The empire is the peace' has been verified, the hand of friendship for hearty co-operation in the peaceful solution of the great problems of civilization. And are there two other nations which, resting upon the tradition of undisturbed friendship and looking forward to a future of still closer relations, could more justly feel called upon to make common cause in the great humanizing tasks of our time in the promotion of art and science and in all tendencies looking to the increased welfare of the people?

"We live in a time of international conciliation and have come to realize that peaceful development is of more transcendent importance than all that is now dividing the nations, and Germany's forty years of peace is an ample guarantee to America that it requires but an incentive in order to crystallize mutual sympathy into a political fact. May this beautiful ceremony hasten such a happy consummation"!

The Kaiser in his reply said:

"We are now glad to possess on German soil the image presented to us by America of that excellent German, who, with inspiring self-sacrifice and unassuming performance of duty, devoted his energies to the cause of the American people.

"The words with which you have given eloquent expression to the meaning of the monument, and today's ceremony, find a lively responsive echo in the German Empire. You have referred properly to the blood relationship and to the uninterrupted friendship which bind together the German and American nations, and which always will bind them more closely."

This was the last official appearance of Ambassador David Jayne Hill, who after the unveiling presented his letters of recall to the Emperor in private audience. He was offered a decoration, but refused it on the ground that it was contrary to American law, accepting instead a vase of royal porcelain. In a public statement he referred to "the legend carefully prepared and widely circulated," charging him with displeasing the Department of State by his course in the potash controversy, and said:

"I have believed that the American people, careless as they often are of reputations, love fair play, and, knowing that the official record there would speak the truth at the proper time, I have taken no notice of either the

enquiry on the merits of these allegations. I have now no comment to make upon them.

On leaving office six months after my resignation, I believe that it will be a pleasure to the President if I make public at this time an autograph statement made by him some months ago. . . . He says:

"'I write now to assure you that I never had the slightest reason to criticise your course and service at the very important post of Berlin. You have vindicated your appointment in every way, and it has given me pleasure to deny emphatically and categorically that your resignation grew out of any disagreement on the part of the Administration with your conduct in this country's relations with Germany in regard to the potash or any other question. . . . I write this to you for you are entitled to have a full statement as to your satisfactory service, written by him whom you have worthily and well represented at the great capital of Berlin.'"

THE NEW PRESIDENT OF PORTUGAL

Manoel de Arriaga was recently elected to serve during four years as President of the new Republic. He received 121 votes out of the 217 cast by the members of the Parliament. He was then congratulated by the Provisional President—Senhor Theophile Braga—whom he succeeds. The new executive is seventy years old, and belongs to a poor but noble family of the Azores, with Basque affiliations. He has long been a democrat, and has preached his doctrine from the tribune and in the school-room. He is universally esteemed. Under the Republic he has acted as Prosecutor-General. The rival candidate for the Presidency, Bernardino Machado, has served meantime as Foreign Secretary.

**The Moroccan Question**

On Monday the French Ambassador at Berlin, M. Jules Cambon, resumed his conversations with Foreign Secretary von Kiderlin Wächter over the concessions which the French Government is willing to make. They are understood to include a cession of certain territory in the French Kongo, as well as mining and commercial rights in Morocco, and if so, it ought to be possible for the two Powers to reach an agreement. Nevertheless, the depression on stock exchanges, the raising of war insurance rates, and the activity in military and naval departments indicate continued apprehension of hostilities. The Belgian Government is hurrying guns and ammunition to the frontier forts, and the Dutch Government is taking similar precautions. The German plan of campaign in recent years is assumed to contemplate the invasion of France thru the neutral territory of Belgium, thus outflanking the strong fortifications which the French have established on the German boundary. It is said that the late King Leopold agreed to allow the German army to march thru Belgium. Since the Kongo State has become a Belgian domain, Belgium becomes a more tempting bait than ever, for its annexation now would give Germany a broad belt across Central Africa, from ocean to ocean, thus cutting the chain of British possessions thru which the Cape-to-Cairo railroad was expected to run. The violent Anglophobia now displayed in the German papers arises from the feeling that it was the interposition of Great Britain which has prevented Germany from getting its share of Morocco. They call attention to the visit of Gen. Sir John French and other English officers to the French fortresses on the German frontier, and recall the fact that he was selected to be commander-in-chief of the allied French and British armies in 1905, when the Morocco question threatened to lead to war. ——The French fleet was reviewed at Toulon, September 4, by the President, attended by the Cabinet. A great part of the French Parliament was present. Ninety-eight war vessels were in line, and M. Delcassé, Minister of Marine,

said that they were all in fighting trim. The Emperor of Germany reviewed a fleet of more than one hundred vessels, with a somewhat lower tonnage, at Kiel, September 5.

**The Persian Railroad**

Last January considerable excitement was aroused by the news that in conversations held at Potsdam, Russia and Germany had come to an agreement as to their railroad projects by which the German road to Bagdad is to be connected with the Russian road across Persia. This agreement has now been formally signed and made public. This appears to be a blow to English interests, for it permits the construction of an overland route from Europe to the frontier of India thru territory not under British control. The Germans obtained from the late Sultan Abdul Hamid the franchise for a railroad across Anatolia from the Bosphorus to Bagdad. It has been constructed nearly to Adana and the company has, within the last few months, obtained from the Turkish Government the privilege of constructing a branch line to Alexandretta and a monopoly for ninety-nine years of the docking facilities of that port. It is expected that the railroad will reach Bagdad about 1918. Beyond that point, however, no outcome could be seen, for the British would not allow it to be extended to its natural terminus, the head of the Persian Gulf. Great Britain claims some authority over the semi-independent chieftains of this region and has been vigorously pushing its influence there of late. The trade from Bagdad to the Gulf, mostly by steamers on the Tigris, is now in the hands of the English, who would not be willing to see it destroyed by the competition of a German railroad. But now, by the favor of Russia, a new outlet is opened. Russia agrees to construct a railroad from Teheran to Khanikin on the Turco-Persian frontier, to connect at that point with a branch line from Sadidie, a station on the German railroad a little above Bagdad. If Russia fails to construct the Persian railroad to Khanikin within six years after the German branch reaches that point, Germany will be free to seek other concessions. It is expected that Russia will soon begin the construction of a line from Baku to Teheran and will continue it across Persia to the Afghan frontier. Germany agrees not to seek any railroad or commercial concessions in Persia to the south of a line running from Kasri-Shirin on the Turkish frontier thru Ispahan, Yezd and Khakh to Gazik on the Afghan frontier. This line forms the southern boundary of the Russian sphere of influence in Persia according to the Anglo-Russian agreement of 1907. (The reader is referred to a map published in our issue of October 10, 1907, showing the partition of Persia into these spheres of influence.) This agreement assigned to Great Britain the southeast quarter of Persia or Mekran. Recently the interest taken by the English in this region has been manifest, and doubtless a railroad to India is in prospect, passing thru Southern Persia and skirting the Persian Gulf and Indian Ocean, following, indeed, much the same route as was taken by Alexander the Great in his march to India. A party of bluejackets and Bombay infantry under Admiral Slade landed on the coast last April and traversed a considerable part of Mekran in search of gunrunners who were smuggling arms and ammunition into Afghanistan. In the north of Persia the Russians have been even more active. Their troops have never been withdrawn from Persia since the revolution that established the constitution and banished the Shah, and it is generally believed that he had the encouragement of Russia in his present attempt to regain his throne. The outcome of that attempt at a counter revolution is uncertain, but so far as we can judge from the meager dispatches he is not making much progress in his march to the capital. Perhaps the resolution shown by Mr. Shuster, the American Controller of Finances, in organizing a treasury guard and putting at the head of it a British major, had a deterrent effect upon the movement. The Russian opposition to the American administration, even when sustained by Great Britain, was not able to shake Mr. Shuster's determination to manage the treasury as he saw fit and defend it to the best of his ability.

# The Defenders

BY IMOGEN CLARK

"IT'S higher than father's mark at half-past seven," Jasper crowed. "Don't you really think it's higher, nurse?"

"My goodness, yes. I've answered that question forty-'leven times. An' of course you're a half year younger than he was, you don't let a pusson forget it. Stop jabbin' my scissors into the wainscottin', an' hand 'em here. The place looks as if the small-pox had passed this way, tho that's natural enough if a room ain't ever been done over, an ginyrations of children have played in it, an' have had their statutes nicked off by long-sufferin' nurses."

"Where's mother's mark?"

"Sakes alive! your mother didn't b'long to this family——"

"Didn't she come here when she was little?"

"She did not, an' no more does she come here to this day."

"Why?"

"It's a long climb," nurse snapped, "an' stairs are bad for palpitations—as I know to my cost. An' what should a woman grown do with toys when the Holy Scripters tells us emphatic to put away childish things?"

"Is that why you're always pokin' mine away, because the Bible says to?" Jasper demanded shrilly, almost willing to pardon her countless raids on his treasures, now that he felt she had only been obeying that mysterious person called God.

"An' your mother ain't a pry-body," nurse continued, unheeding the interruption, "I'll say that for her. Besides, she's too fond of society."

"But why doesn't father come?"

"A man's diff'runt; he's busy makin' money—well, there's no call for her here, tho mostly she don't come because she don't want to."

If the words carried any sting, the child was apparently unhurt by them; he edged a trifle nearer the speaker and smiled up into her face.

"I thought maybe this little goldy mark was where she'd leaned back her head," he confided wistfully, his finger indicating the spot.

"That ain't a growin' nick," nurse cried disdainfully, "it's just a knot in the wood." She turned to leave the room. "I've got somethin' to tend to downstairs, but I'll be back soon," she volunteered, then she slammed the door behind her, opening it the next moment to say admonishingly: "Be sure you behave yourself. Your mother's layin' down, she's got a headache, an' she ain't to be disturbed."

Jasper heard the latch click to again with indifference. He had long known that the something to which nurse referred with such mystery was her usual afternoon chat with the other servants in their pleasant sitting-room. He had often crept down in her wake and, peering thru the crack of the door, had seen her lolling on the settee while tea simmered on the hob, and the delicious smell of toast floated out to him. On days when he was particularly lonely he would sit on the lower stair listening vaguely to the unceasing conversation. There was little danger of discovery. He knew just where to step to avoid creaking boards, and there was always ample time to scuttle noiselessly up to the play-room, even if he waited until nurse uttered her fifth, "Well, I must be a-goin'."

He did not follow her now, nor did he try to amuse himself with his solitary games. The idea that his mother as a child had not known the old play-room hurt him keenly. He had imagined her there with those children of the long ago who often came out of the shadows to be with him. But the walls, that held the shouts and laughter of those earlier times, had no faintest tinkle of her joy to give back to him; nor was there a record of her growth in the blazed trail of childhood which chronicled the passing of other girls and boys. Even the golden spot, that had never become dingy

like the rest, did not belong to her. And yet the sun had seemed so to love it, lingering there on bright days till the clouds in the West were rosy. He had loved it, too—and it was only a knot in the wood.

He turned to the window, choking down a sob, and stared out at the lowering November sky. Thru the leafless trees he had a glimpse of the avenue that led to the great gates, lying beyond his vision, but which he knew opened upon the world. He had often seen his mother come up the drive on horseback, and once she had waved her crop to him. He pressed closer against the pane, peering forth expectantly, tho the next instant the remembrance that she was ill made him forget his own disappointment in his longing to let her know how sorry he was. He would whisper so softly thru her door that she'd think it was some dream message, but it would make the ache better. It would be almost as good as turning the pillow for the cool side—the way nurse had done when he had the fever. He wondered if his mother knew about the cool side, and started to tell her, then stopped abruptly. She mustn't be disturbed.

He went back to his post and watched the dead leaves swirl unceasingly in and out among the trees, where the mist rolled up in gusty spirals. The chill of the approaching storm penetrated thru the glass, making him shiver, and the wind—now loud and fierce, and now with its long, low moan—filled him with vague fears. It seemed to be calling—calling. He stood listening, looking, and suddenly the drifting brown masses were changed into strange forms that he told himself excitedly were robbers and evil spirits. The waving boughs flung out their gaunt arms as if beckoning to an unseen host, and up from the hollow and from every side dim shapes pressed forward with a hum of clashing voices.

Jasper raised the window and leaned far out.

"Back! back!" he cried shrilly. "My mother ain't to be disturbed."

The next moment he flung himself upon the toys that littered the floor, tossing them about with reckless haste, until a trig, wooden figure clad in scarlet rewarded his search.

"'Tention! Sergeant Jones," he ordered breathlessly. "You've got to go on duty. There's robbers, an' wicked dwarfs, an' gobbleins out this night; they're comin' to frighten my mother, an' she's got a headache."

The sergeant, happily immune from such physical ills, maintained an unsympathetic silence.

"You're to guard her with your life," the whispered commands went on; "you mustn't let any harm come near her. Sergeant, I know you ain't afraid, but if your knees get shaky remember I'm guarding too, an' the enemy will have to step over my body first. I'm going to take the importantest post 'cause she's my very own mother, but you'll stand just outside her door. An' oh! I say unto you, please be very guardful."

He swept the unresisting Jones into his arms and hurried down the back stairs, wondering as he tip-toed along whether he ought to warn the servants of the danger. If he told them they would send him away—he knew that well enough—and after they had routed the foe they would let his mother praise them for their bravery without saying a word about him. A spasm of jealousy shook his small frame. No, he wouldn't tell—he'd save her himself—he and Jones could do it. And when it was all over she'd put out her hand like the Gracious Princess in the story, and say, "Thank you my brave defenders," and she'd draw him gently to her—yes, the Sergeant might come, too—and her arm would go round them both, and then perhaps she'd kiss him—not like a Princess in a story, but like a real mother, like that mother he'd seen the other morning. "A common village woman," nurse had said, but oh! the way she'd caught the barefoot boy to her, and had kissed him. And the boy hadn't saved her from a single robber, or a gobblein. He'd only come running from school. Surely *his* mother would be gladder and prouder to have her boy fight for her than just to have him come home from school—there wasn't anything brave in that!—so she'd do more than kiss him

once, perhaps she'd kiss him two, three, forty-'leven times—per-haps.

Almost instantly his high heart fell as another thought pricked him. Suppose he and Jones drove back the invaders without disturbing her, and she knew nothing of the danger. Suppose she woke up with her headache gone, and all she'd say would be, "I don't know why I'm so happy, I must have had a lovely dream." Was he willing that she shouldn't know? Was it enough to serve her, and then steal away? Was he ready to do without thanks, or praise? The questions went on without pause.

"Yes," he whispered back to the clamoring cries as he hugged the sergeant close, "we're willing, but we won't tell the otners; we'll save her ourselves."

He paused on the lower stair and peered into the servants' sitting-room, thru whose half open door came light, and warmth, and the nice toasty smell that he loved. He could see a number of seated figures, tho nurse was not among them; he knew she was in the window, however, for she was speaking; he'd have recognized her throaty voice anywhere.

"Sakes alive! can't nobody make up another word for a child's vocabilary? I'm sick to death of that everlastin' why. Pretty soon you'll have to put on my tombstone, "Here lies a faithful nurse as died of too much whyin'.' Pass the toast, Molly, dear. You'd never think a boy could be so irritatin', but from mornin' till night he's at it. Why—why—why. An' now he's taken to bein' nicked off to see how he grows."

"I caught him in the rain the day you went shoppin', an' shook him same as you'd a-done." It was Molly who spoke; Jasper's shoulder would have testified to that had his ears failed him. "He said if you stood in the wet you'd grow tall. He wouldn't let on who'd told him."

"Oh! he'll do," chuckled the butler. "Ladies, behold the informer."

"It's easy knowin' you're a single man, Mr. Parkins," nurse cried sharply. "That nonsense accounts for his cough. I set it down for that an' dosed accordin'. He's got a terrible delikit chest."

"Poor little kid," some one cried sympathetically.

"As for nickin'," the familiar voice went on, "every right-minded nurse will mark off her charge to see how he comes on. I began as soon as I set foot here—six years ago—an' for a while the nicks was promisin'. That's more than they are now. A little undersized chap, so he is, tho he don't suspicion it. But the lies I tell—I'm hopin' they won't be held against me."

"Don't be botherin' about 'em. Sure, Mary hersilf was a mother, an' she knows the inquisitious ways of children."

"You're a true comforter, Mrs. Cook. Yes, another cup of tea, thank you kindly, an' three lumps this time. Well, I've picked out some old marks on the wainscottin' an' named 'em his father's, tho they might have b'longed to anybody, but Jasper's satisfied. To-day he slips into a nick that would fit a six-year old child, one small for his age, an' he—thinkin' it's his father's at seven an' a half—struts like a fightin'-cock, because he's the same hight, tho six months younger. What's that?"

"Dear me, ain't you nervous! That was nothing. You know how old houses crack of themselves."

Outside Jasper picked the sergeant up from the floor.

"Are you hurt?" he breathed into the wooden ear. "Don't mind, brave heart."

The sergeant was silent. He was a soldier—a defender—no matter what caused him pain, a fall, or—or other things—he gave no sign, only inside, perhaps, he felt aching and dizzy.

"If you please," nurse continued, "that boy found a knot in the wood an' wanted to know if it was his mother's nick. Such a to-do as I had drivin' it into his head that she didn't b'long to the fam'ly, an' hadn't come to the playroom when she was little, any more than she comes there these days."

"I suppose he misses her somethin' fearful," Molly said softly (you wouldn't have thought that a person who could shake so hard would really understand); "his eyes look that big an' longin'. She might go there some time an' say a lovesome word."

"I'm thinkin' the same," Parkins cut in, and his voice had a ring like Molly's—"if a chap is lonely for his mother, there ain't a loneliness like it anywhere."

"Shucks!" nurse cried hotly, "it's the why croppin' out in Jasper. I put him off with stairs, an' her not pryin' disposed; then I told him flat that she didn't come because she didn't want to——"

"You didn't——"

"I did then. An' you needn't look so round-eyed, Miss Maria Connolly; 'twas the truth. Ev'ry mornin' reg-lar I take him to see his mother, but she never returns our calls; she's too busy gaddin'. Of course it's a blow to her an' to the father as well, that the boy—instid of bein' forward, an' strong—is little, an' shy, an' often ailin'."

"Deary, oh! deary," murmured Cook, her voice like thick cream gravy. "An' the missus such a beauty, an' proud as Lucifer into the barg'in. Likewise Mr. Galbraith hisself. Where's the use of their money, an' havin' a house as has been in the fam'ly since time was, an' naught but a weakling to come after, for delikit is tougher than tough, an' more lastin'—as has been proved often. Well, we're all in the Lord's hands."

"Oh!" Molly cried, "if he was mine I couldn't let him out of my arms hardly, I'd be lovin' him so. I don't see how the two of 'em can seem to forget him so often."

"They've spent heaps on doctors," nurse snapped, "but the trouble was done by that brazen-faced hussy as was nurse before I come. The idea of keepin' a year-old child outdoors for hours, while she listened to the guileful tongue of man. All the doctors in the world can't mend consequences arisin' from damp grass—it's too much to expect. The boy's pulled thru so far, tho that ain't to be wondered at with me at the hellem, an' faithful. Well, I'll let others speak I'm fond of him myself, an' so's his parents, only they ain't proud of him. But they give him plenty clothes, an' toys——"

"Them things don't count," interrupted Molly. "I'm sure he'd rather his mother would put her arms round him cuddlin' fashion than to have a thousand toys. An' Mr. Parkins, you'll hold with me, I know, that the boy that looks out of them great, yearnin' eyes would be satisfieder if his father would take him out walkin' of a Sunday, than if he could journey to the Pole in a cheryot of gold."

"Miss Connolly," Mr. Parkins returned gravely, "I harmonize with you in totem. You've expressed my thoughts to a T."

"'Tis a thousand pities Miss Connolly can't make 'em known to the parties they most concern," nurse said coldy. "Well, I must be a-goin'."

"Deary, deary," ejaculated Cook; "there's no call for departure. Set a bit longer an' rest your bones. Susan, love, fetch in them jam tarts an' a taste of cheese likewise. Have you heard what's happened over to Enderby's?"

Outside the little figure, crouching on the stairs, was motionless. Oh! if you want to be happy, don't ever listen on the stairs. You hear such cruel things. Don't sit close to the banisters with the light, and the warmth, creeping out thru the half-open door, creeping quite close to your feet, and the nice smell of toast in the air, and all about you the sound of laughter and many voices—laughter that stabs, and voices that say things you are sorry to hear—that you will be sorry to hear ringing in your mind, if you live to be ever so old—as may happen, for we are all in the Lord's hands. . . . The sergeant was motionless too, but there was comfort in the stiff body pressed so close to the boy's heart. Comfort, and presently counsel as well. Evidently the soldier, forgetful of military discipline, brought the sense of duty home to his superior officer. And Jones was right, of course: defenders must never think of themselves, no matter how bruised and tired.

Jasper got noiselessly to his feet and took his way with extremest caution to the front of the house, love lending him wings. As he entered the great hall his eager glance ran before him to the heavy doors that led out to the open. They were closed; the invaders had not yet forced them wide. His breath came more easily. After all, he and the sergeant were not too late. Dusk was settling everywhere and objects that by day were harmless enough took on strange shapes. He tried not to see them, his eyes seeking out instead his grandfather's sword in its place on the wall. It hung far above him, but the desire to use it in his mother's defense swept aside all obstacles. In an instant he had climbed into a large chair beneath the

weapon, but his straining fingers were unable to touch the point. Undaunted he sprang down, and placing a hassock on the seat he discovered that he could grasp the blade tho, try as he would, the sword was as clearly not for him as Excalibur was ever beyond the attainment of unworthy knighthood. Baffled, almost disheartened, the boy released his hold. His fancy pictured the assembled foe without, he could hear the tramp of many feet, and he knew he could not wait there while her door was unprotected. Yet unless he were armed how could he resist the attack? Again he sprang down and searched desperately until he found another hassock which he added to the first, then by means of the chair's arm he mounted to the top and, standing on tip-toe, reached the handle. He pressed close to the wall, lifting the sword almost coaxingly—up, then out from the nail—up, then out. His body reeled with fatigue, his head swam. There seemed to be swords everywhere, mocking him with their brightness. Up, then out from the nail, then—down. Yes, down!

The stool turned under his start of triumph. He tried to cling to the chair's back and failed, pitching forward on the rug, the coveted treasure still in his arms. For the tiniest fraction of time he lay trembling with the fear of discovery, so loud had the noise of his fall seemed to him, tho it had evidently not reached the distant tea-drinkers, and, satisfied of that, Jasper scrambled up hurriedly. The next moment he climbed the stairs to the story above and, just beyond the landing, found himself in front of his mother's closed door. Then he stationed the sergeant near the threshold and took his own position a trifle in advance, the sword gleaming in his hand. So he waited, each minute age-long in its passing.

There was no sound of human life anywhere, there was nothing but the roar of the wind without, tho to him the din of the approaching host was unmistakable. Suddenly in the hall below some article of furniture cracked pistol-like in the stillness, and simultaneously with the report a colder gust of air swept in thru the open window a few feet from him. Like fire a thought ran thru his mind. The attack had begun—the doors had yielded to the invaders! He gripped the sword tighter. Now they were crossing to the stairs—creeping up, and up, then falling back dismayed at sight of him standing there. He thrilled from head to foot. Ah! he knew he could guard her—a shy, little delikit boy, with a heart as big as if he'd been forward and strong. Didn't she know that? Oh! but it was bigger—bigger. He cast a loving glance at the door; then, eyes in front of him, he turned to his duty.

It grew darker, and it was ominously quiet. But he did not relax his vigilance; he told himself that the invaders were taking counsel together how best to overcome him. As he waited strange shapes seemed to form near at hand in the dusk, and the curtains at the window moved—and *moved.* Was the attack coming from there, too? He had not dreamt of that, but below-stairs it was very still. He patrolled the space in front of the door, so many paces to the right, then wheeling, so many to the left, the sword held breast-high. After a little his steps lagged. He was very tired; his hands and arms ached intolerably, and underneath his bold exterior his heart was sick with fear.

Presently the hush was broken by a different sound. He heard it very far off. A quick, firm tread that came nearer and nearer. It sounded like a major-general's step. Panic gripped him. He couldn't stay any longer—the children in the old play-room were calling to him—he couldn't stay. If he ran down the hall he was sure he could find the back-stairs. He started in their direction, the sword trailing in his nerveless grasp, then something within him seemed to whisper, "She ain't to be disturbed," and the words kept him true to his purpose.

He crawled back to the deserted post, his eyes averted that he might not meet the sergean't gaze, and faced the stairs beyond with raised sword. There was no mistake this time. The invaders were coming, not stealthily, but boldly—resolutely. In the gloom, which lay everywhere like a veil, his straining eyes made out a dim, dark form that grew larger, and larger, like the evil genii escaping from the flagon—larger—and larger. His head whirled, his heart pounded in his ears, he tried to speak, but his throat

seemed closing over. "Go back," he managed to cry at last; "my mother's got a headache. Don't you hear me? You mustn't frighten her—she ain't to be disturbed."

He made a frantic lunge with the sword and rushed upon the approaching figure. The place went round strangely; he tripped, righted himself, and went on for a few paces, then fell headlong. And as he fell, something reached out and caught him. He struggled momentarily to free himself, but it was in vain; he seemed to be sinking—sinking. "To arms, sergeant!" he gasped. "Don't—let—them—harm mother. I—couldn't—keep—them—off. I——"

Then it was very dark.

When Jasper opened his eyes again there was light everywhere, but it was so soft and rosy it was like the lining of some sunset cloud. He closed them almost immediately, tho he seemed to shut in a good deal, and of one thing he was very, very sure. He wasn't in the play-room. The play-room walls were dingy, and the little nicks went up, up, measuring those far-away children. There was one nick that was father's at halfpast seven—no, it wasn't father's, it belonged to somebody else at six-years old, and small for his age. He couldn't bear to think of that nick, nor of the other one that was only a knot in the wood. But in this beautiful place there were no nicks anywhere—he was glad of that! The walls were covered with trailing vines of big pink roses that somehow brought the summer indoors, and the air was very sweet. It was quiet, too, except for the sound of whispering voices. Not Molly's, nor Parkins's, nor nurse's—but different voices . . . Oh! he musn't listen. You hear such cruel things when you listen—he must let them know he was there. He tried to speak, and instead of his own voice he could only hear the others. What were they saying? "Just tired out from excitement, and from holding that heavy sword? Are you sure the doctor didn't say anything else? Leonard, I must know the truth. Doctors always say more to fathers than to mothers. What, you're very sure? And he'll be all right in a couple of days? Oh! I'm so happy—so happy. Tell me again how you found him."

"Like a soldier defending your door, with grandfather's sword in his hand. He'd got it himself—the wonderful kid!—there's a chair piled with hassocks in the hall that shows how he managed it. I tell you, Amy, that boy had the pluck of a whole battalion. It wasn't a game to him, he actually believed I was some enemy coming out of the dark, and he never flinched. Back of the terror in his voice there was a ring of courage that thrilled me like a bugle-call. And when he fell, when he supposed himself at the mercy of his foe, he called to the toy soldier on guard to save you where he had failed—his one thought was for you."

"He loved me like that! And I" (was that a sob?)—"I've neglected him cruelly, I——"

Something very soft was thrown around Jasper's body, pressing it close, then he felt himself drawn gently up, and made *so* comfortable. Was that cuddling fashion? Nurse's arms had never felt that way. He raised his head from the ribbons and sweet-smelling laces, and looked into a pair of eyes that were bluer and more lovely than the eyes of the Gracious Princess. There were tears in them, and a happy light besides, and they gave him a glance that was like a kiss. Only not quite! Kisses were such nice things, they really couldn't be imitated. Oh! the beautiful rose-hung room where listening brought no pain, and oh! the love in the faces leaning above him. He started to whisper a choking word or two.

Then from the other side of the bed a man's hand reached out and closed over the thin, little one, and a man's voice said shakily: "Father's brave boy."

And quickly, almost jealously, the other voice chimed in: "Mother's darling little defender."

"There was the sergeant, too," Jasper murmured happily.

But nobody else had a thought to give to Sergeant Jones. He lay on the hall floor without, alone—forgotten. His faithful body was broken and crushed by the passing of many feet, but his face still wore the old, valiant smile, as if he had been content to do his duty, winning no word of praise. O farewell, honest soldier!

New York City.

# The Woodstock Pageant

BY CONSTANCE HOLT

WOODSTOCK, in Windham County, Conn., is one of the oldest and most beautiful towns in New England. It was founded in 1686, and remains to this day a quiet and secluded village. Many of its present inhabitants are directly descended from the original settlers, tho of late years a large influx of Swedish immigrants has taken up many abandoned farms.

During the past generation, however, Woodstock has been chiefly known for its long series of Fourth of July celebrations, where Presidents Grant, Hayes, Harrison and McKinley, and scores of other distinguished men, addressed the gatherings on the old "Common" and later at Roseland Park. These celebrations were originated and carried out by the late Henry C. Bowen, the proprietor of THE INDEPENDENT, and the older readers of this magazine will recall the full reports of the speeches that were printed in its columns.

Since Mr. Bowen's death they have been discontinued, but this summer the old common witnessed another celebration, this time, however, of a new kind.

There have been many pageants given thruout the country within the past few years. The young people of Woodstock decided to make use of its rich historical material in a similar pageant. The expenditure of a large sum of money was out of the question, but plenty of genuine old-fashioned costumes and properties were available in many an old garret and were willingly loaned for the occasion. An appointed committee searched the old histories and town records and interviewed the oldest inhabitants for interesting bits of information and local color.

On a beautiful afternoon last month (August 12) four or five hundred people

THE FIRST SETTLERS ARRIVE

Each man bringing his family and his belongings all the way from Roxbury in an oxcart. The settler here is impersonated by his great great-great-great-great grandson

assembled on the common. There the pageant was given, followed by a series of nine tableaux depicting bits of the town's history from early Indian days down to modern times. A procession of over fifty people in costume headed by a bugler marched down the length of the common, a large open green surrounded by towering trees. Settees were placed under the trees for the spectators and the backstop of the ball field near the center of the common was banked with boughs of evergreen and laurel, behind which the procession made its "green room," and in front of which the tableaux were given. A short description of each tableau, taken from some ancient chronicle, was read before its presentation. The following historical incidents furnished nine scenes:

1. Among the many stories of Indian days that have come down to us is that of John Winthrop's starving colony in Boston, and how the Wabbaquasset Indians, hearing of it, gathered large quantities of corn in sacks and bore them on their backs all the way to the infant settlement on the Massachusetts Bay over the trail which later was known as the Old Connecticut Path. This incident furnished the first tableau and all the players impersonated Indians.

2. The story of John Eliot is perhaps more familiar. We all know of how he preached the gospel to the Indians in his tour thru the wilderness, which is now Connecticut. To this day the granite rock in Woodstock on which he preached can be seen, and is held in sacred memory by the townspeople. The accompanying picture shows how this incident was reproduced in the tableau.

WITH SILENT PRAYER

It opened the ceremony of casting lots for the division of the virgin soil

3. In the coming of the first settlers to Woodstock, we are told of the journey down from Roxbury, Mass., when each man brought his family and all his belongings in an ox-cart with a cow and sheep tied behind, and a box of chickens, cooking utensils and rude farm implements loaded within. Before these settlers arrived, thirteen men had gone ahead as pioneers to prepare for the coming colonists. From these a committee of seven was appointed to stake out the highways and decide on the place for the settlement. The old record tells of how

GENERAL ISRAEL PUTNAM
Having received news of the Battle of Lexington, bids his wife and son good-bye and starts for the front

JOHN ELIOT PREACHES TO THE INDIANS
Meantime a messenger from Uncas rises and denounces the Apostle

the men afterward drew lots for the division of the land, the ceremony being conducted with great dignity and solemnity. In the ox-cart of the tableau shown in the illustration the driver is a lineal descendant of the original settler he impersonates.

4. In the early days of the Indian wars the inhabitants of Woodstock often sought refuge in the old log fort to protect themselves against the red men. It is related that the grandmother of Oliver Wendell Holmes, then a young belle living in Woodstock, volunteered to go out from the fort to gather vegetables for the women and children sheltered within. An Indian espied her as she was starting out, but some inclination caused him to refrain from killing her; and years afterward he returned to tell her of her escape from his tomahawk. The great-great-great-granddaughter of this girl impersonated her in the tableau.

5. In pioneer days the luxuries of modern life were unheard of. Austere was the life and frugal the meals of Woodstock's sturdy inhabitants. One chronicle tells an amusing incident of Thanksgiving Day. While the head of the family was asking the Divine blessing on the meager repast, the table was upset by a dog and the dinner of milk-pudding destroyed. The family had no Thanksgiving dinner that year. Some of the descendants of this family took part in the tableau depicting the Thanksgiving dinner.

6. Windham County sent many able men to the Revolutionary War. The most noted of all was Gen. Israel Putnam. The story of how he left his plow in the field and galloped off to the war upon receiving news of the battle of Lexington is too familiar to need repeating here. One of the illustrations depicts this historical incident as it was represented.

7. Just after the battle, when the troops from all parts of this region had departed for Cambridge and Gen. Samuel McClellan had ridden thru South Woodstock on his way to the war, his wife, in a loyal spirit of patriotism, set out four memorial elms in front of her house. One died, but the other three still stand on the South Woodstock com-

GENERAL GRANT INTRODUCED TO THE PEOPLE OF WOODSTOCK
By Henry C. Bowen, impersonated by his grandson.

ment in commemoration of the battle of Lexington. The planting of the McClellan elm was the seventh tableau.

8. The blue laws of Connecticut were very rigid in the first part of the nineteenth century, and we find many amusing accounts in the town records of punishments meted out to offenders who failed to keep the sabbath day. This tableau represented a culprit in the stocks while the populace pelted him with eggs.

9. On July 4, 1870, while President of the United States, Gen. Ulysses S. Grant visited Woodstock at the first one of Mr. Bowen's celebrations, and commemorated the event by planting an elm tree on the lawn in front of the Academy. The accompanying picture shows Mr. Bowen introducing General Grant to the people.

From gleanings such as these it is quite evident that almost any American town, even a very small one, can produce a similar pageant. There is always plenty of material at hand, and given a band of able and enthusiastic workers the results will far exceed expectations and be most instructive to all concerned, players and spectators. Aside from the spectacular features of such pageants they are of great value in awakening the people to an intelligent interest in local historic events. Many need just such an awakening. There are hundreds of people today who, while pluming themselves on their knowledge of United States history, know little or nothing about the history of their own town or village.

Thus Woodstock's advice to other communities would be:

Read the history of your town and county. Look up the town records. Examine all the old engravings you can find as a help toward the costumes. Then search the old homesteads for costumes and accessories—an easy task when almost every one has something that will help out. You will soon find yourself absorbingly interested in the outcome of your pageant, and the amount of your enthusiasm and zeal will determine the success of your efforts. Try and see.

WOODSTOCK, CONN.

# The Optimist

BY ELLIS O. JONES

"OH, well," said the Optimist after election, "it seems to be a pretty bad Congress, but it is not at all likely that it will pass any evil laws."

"Oh, well," said the Optimist after Congress had passed a particularly evil law, "it will undoubtedly be killed in the Senate."

"Oh, well," said the Optimist after the Senate had concurred in the action of the House, "perhaps the President will veto it."

"Oh, well," said the Optimist after the President had affixt his signature, "perhaps the Supreme Court will declare it unconstitutional."

"Oh, well," said the Optimist after the Supreme Court had declared the evil law not only constitutional, but also quite reasonable, "perhaps the Administration will forget to execute it."

"Oh, well," said the Optimist after the Administration gave evidence of intending to execute the law, both in letter and in spirit, "perhaps it will be repealed some time."

NEW YORK CITY.

# Jeffery Farnol and "The Broad Highway"

BY HENRY C. SHELLEY

[The popularity of the recent novel, "The Broad Highway," has directed attention to its author, Jeffery Farnol, the young Englishman, who came to this country seven years ago to earn his livelihood by writing, but who returned to his home in Kent discouraged and dismayed by the failure of New York publishers to appreciate his major effort. Mr. Shelley, another English author, whose books, including "Literary By-Paths in Old England" and "John Harvard and His Times," were first published here, has interviewed Mr. Farnol in his home in Kent for THE INDEPENDENT.—EDITOR.]

JEFFERY FARNOL has one regret in connection with the deserved success of "The Broad Highway." That success has come four years late. "Just think," he ejaculates, "I've lost four years of my life!" It is not his fault; he did his part forty-eight months ago.

For "The Broad Highway" is distinctly in the succession of successful novels in the dilatoriness of its reaching the reader. The manuscript, in fact, has had the usual fate of those scripts which are among the treasures of our museums; rejected of publishers, but at last the object of animated biddings in salesrooms. In the ideal commonwealth publishers will probably be punishable for their obtuseness; for Mr. Farnol is not alone in having a grievance; his thousands of readers have lost four years as well as himself—four years' memory of the forthright Peter, the adorable Charman, the unique Ancient, the loquacious Tinker, the combative Black George, and all the rest.

MR. JEFFERY FARNOL.

Three causes, nay, four, conspired to keep "The Broad Highway" so long in the manuscript stage. One was the number of its pages; "it's too long," affirmed one publisher. Another was its geography; "it's too English." A third was the panic of 1907; "money's too tight to risk bringing it out just now." And the fourth was the forgetfulness of a friend, who offered his services in commending the manuscript to the firm that finally issued it, but instead of keeping his promise hid the script in his trunk.

But the publisher who first rejected it deserves some benefit of clergy. He was at least the cause of the novel being completed. It happened in this way. Mr. Farnol had written a number of short stories of such unusual merit and distinction that Mr. Publisher asked whether he could not submit a novel. Not at the moment, was his re-

ply, but he had one in hand. Urged to complete it as soon as possible, he complied, and in due course the script of "The Broad Highway" reached Mr. Publisher's hands. This is where those wiseacres known as "readers" came in. There were some half dozen of them and they had as many opinions. They did not all fail in appreciation, but their verdicts were so diverse and contradictory that the simplest way out of the difficulty appeared to be by way of conference. That was Mr. Farnol's happy suggestion; "call your readers together," he said, "and I'll meet them to discuss their objections." If he should ever write the story of that conference, it would make an amusing addition to the curiosities of literature. With his manuscript before him, and pen in hand, he waited to censor himself. And as coherent suggestions were not forthcoming, he made a few himself. "This can come out," he remarked, indicating a specific section, only to be checked by "oh, no; if you take that out so-and-so won't be understood." Another, and yet another sacrifice was offered, but each met the same fate from one reader or another; "it would never do to cut that because"—thus and this and that. So Mr. Farnol abandoned the task in despair, and the conference broke up with the fate of "The Broad Highway" as undecided as ever.

Over the delinquency of the friend it were better to throw the mantle of charity. He meant well, no doubt, and probably made his promise in good faith. Mr. Farnol has no doubt forgiven him.

Mr. Farnol's failure to find an American publisher for "The Broad Highway" naturally reacted on his own opinion of the story. He grew so despondent that he would have sold it outright for the first offer; at one time, indeed, he was tempted to consign the manuscript to the fire! But at that juncture he remembered the friend of his "boyish ambitions," the Byron Jevons to whom the novel is dedicated. He had been the first to discuss with him the difficulty of writing a book dealing with the abstract, citing, as a rare example of success in that line of writing, the "Tristram Shandy" of Laurence Sterne. Mr. Farnol speedily procured a copy of that unusual book, and he yet recalls as tho an impression of yesterday the manner in which he was "enthralled" by its pages. "Then," he added, "I went on to the *Spectator* and the *Tatler*, the reading of which showed me how great is the loss of those unacquainted with the Queen Anne essayists." All of which is extremely interesting in view of the many guesses which have been made as to Mr. Farnol's foster-fathers. No one has mentioned Sterne or the essayists, yet, on Mr. Farnol's own confession, it seems that they have been his chief literary parents; from their pages he has caught the quaint style of speech common to a bygone period of English history, but has made it modern by the force of a story which deals so triumphantly with passions that know neither geography nor time.

No doubt Mr. Jevons was somewhat surprised to receive the manuscript of "The Broad Highway"; he had expected his young friend to take quite a different line in life. When he learnt of Mr. Farnol's earlier attempts at story-writing, he was surprised and good-naturedly indignant. "I thought you were ambitious to be an artist," he said. He had changed his mind. "Well," rejoined his mentor, "do you know Greek?" "Not much." "Or Latin?" "Very little." "Are you going to a university?" "Funds won't permit." Then his scheme was absurd; stories worth anything could be written only by scholars; he must abandon his idea. But that is not Mr. Farnol's way. He is as dogged by nature as his own Peter Vibart; so he wrote, and wrote, and wrote, and "The Broad Highway" is his justification.

Whether surprised or not, Mr. Jevons was soon absorbed in the manuscript which came to him from over the Atlantic. And then he took it to a publisher. "I don't ask you to print this," he said, "or intend venturing any opinion; but oblige me by reading it." The manuscript had finished its travels. No more objections were urged about it being "too long" or "too English"; grace was given to the English publishers of "Lorna Doone" to realize the value of the opportunity afforded them, and the publication in London of "The Broad Highway" last Christmas gave the story to that wider jury which has since returned its verdict in no uncertain terms.

THE BULL INN, SISSINGHURST

Besides enshrining Mr. Farnol's memory-pictures of Kentish lanes and villages, "The Broad Highway" is in many other respects a personal book. For example, who can fail to observe how plentifully the odor of eggs and bacon permeates the story? Frying bacon sizzles in the opening chapter; ham and eggs made up the breakfast over which Peter and Black George cemented their friendship; and "bacon and eggs—one shilling and fourpence" was one of the items which perturbed Charmian when making up her weekly accounts.

Again, even the most hurried reader of the novel must have observed the poetic and tender beauty of its varied descriptions of night landscapes. Those descriptions are what they are because Mr. Farnol writes "with his eye on the object." He has nothing in common with those novelists who depict sunrises from their inner consciousness or midnight scenes from hearsay. The fact is, Mr. Farnol is a daytime observer and a midnight worker. He goes to his desk in his home in Kent each evening about the hour of nine, and his usual custom is to write on for eight hours at a stretch. No wonder that he writes of the night landscape with such poetry and deep feeling. This unusual habit of work is temperamental with Mr. Farnol; he feels that his creative power is at its best when all disturbing influences are obliterated.

Already the country of "The Broad Highway" is attracting its pilgrims. And the novel is the best guide to the district, for Mr. Farnol has taken the names of his villages direct from the map. Cranbrook and Sissinghurst are within a couple of miles of each other and both are less than fifty miles southeast of London. The ancient buildings of Cranbrook include the old Posting House where Peter was arrested for the supposed murder of his cousin, and the sturdy square tower of the church in which he was imprisoned; while at Sissinghurst, which is still a dreamy, sleepy place, the wayfarer cannot mistake the Bull Inn which plays so large a part in the story. The surrounding country shows Kent in its most lovely aspects and amply justifies Mr. Farnol in his choice of background. He will probably remain faithful to that background; the larger part of the scene of his next novel will be laid in the same county; and, in view of his fondness for pirates, it may well be that in the future he will journey coastward and give us a thrilling story of the freebooters who used to haunt the narrow seas.

LONDON, ENGLAND.

# The Race Mind of the Chinese

BY EDWARD ALSWORTH ROSS

[Professor Ross of the University of Wisconsin, recently made a tour of China for the purpose of studying the social conditions. Now that the Middle Kingdom is in a state of transition due to the impact of foreign ideas upon its established civilizations the observations on the characteristics of the race by the author of "Social Psychology" are of especial interest to American readers.—EDITOR.]

THE more cheaply gotten up races of men have a short mental circuit and respond promptly to stimulus. Knowing the impulses aroused in them by their experiences you can foretell their actions. They cannot inhibit their impulses and let them accumulate until reflection has fused them into a conscious purpose. But the races of the higher destiny are not so easily set in motion. They are able to hold back and digest their impulses. The key to their conduct is to be found, not in their impressions, but in their thoughts and convictions. Their intellect is a massive flywheel by means of which continuous will-power is derived from confused and intermittent stimuli. The man of this type does not act till he has made up his mind, and he does not make up his mind till he has heard both sides. His emotion is not as the crackling of dry thorns under a pot, but like the lasting glow that will smelt iron. His conduct is not fitful and zigzag, but even and consistent. More and more this steady and reliable type is demanded in a social organization so complex that normal action must be deliberate, and in a civilization so scientific that pondered knowledge is essential to wise decision.

We like to think of the Anglo-Saxons as of this stable type and feel that such an endowment makes up to our race for its lack of the quick mobile feeling, the social tact and the sensitiveness to beauty so characteristic of South Europeans. Now, of this massive, unswerving type are the Chinese. Fiery or headlong action is the last thing to be expected of yellow men. They command their feelings and know how to bide their time. They are not hot today, cold tomorrow. Hard are they to move, but once in motion they have momentum. Slow are they to promise, but once they have promised for a consideration they "stick." They are stubborn to convert, but they make staunch converts. Their eloquence is more akin to the eloquence of Pitt or Bright than to that of O'Connell or Gambetta. One does not term suicide a "rash act" in a land where so many suicides are carried out of set purpose. Instead of assassinating the high-placed betrayer of his country, the Chinese patriot sends his Emperor a plain-spoken memorial about the traitor and then kills himself to show he is in earnest. No matter what their intensity of feeling, the members of the provincial assemblies that met for the first time two years ago kept themselves in hand and surprised the world by their self-restraint and decorum.

Some observations made by a gentleman writing life insurance in Hawaii throw a strong light on Chinese traits. He found the Japanese impressionable and easy to persuade, especially if he learned that other Japanese were taking out policies. Tell him his friend So-and-so has insured and he promptly orders a bigger policy. But when, a month later, the policy arrives from the New York office, his interest has cooled and he will never take it unless he was required to make an advance payment. On the other hand, the Chinaman cannot be cajoled nor stampeded. He takes a sample policy home, studies it over night, and the next day is ready with his answer. If it is "Yes," he invariably refuses to make an advance payment on the ground that as yet he has received nothing of value. When the policy arrives he receipts for it, takes it home and compares it line by line with the sample

policy. The next day he is always ready with the premium. I introduce this comparison not to discredit the Japanese, for their gifts are well known, but to bring out the deliberate, unimpressionable character of the Chinese.

Chinese conservatism, unlike the conservatism of the lower races, is not merely an emotional attitude. It is not chiefly inspired by dread of the unknown, horror of the new, or a fanatical attachment to the established. It is the logical outcome of a system of ideas which gives them confidence in precedent. Once change the ideas of the Chinese and their policy will change. Let their minds be possessed by a philosophy that makes them doubt the past and have confidence in the future, and they will prove to be as consistently progressive as are the Germans of today.

The Nestor of the missionaries, Dr. W. A. P. Martin, of Peking, after his sixty years of labor in the Orient, believes that the modern Chinese have somehow lost the originality and inventiveness their forefathers possessed in the great days of old, when the civilization of the Middle Kingdom was still in the gristle. He surmises that this precious endowment was wasted by the continued use of the memory-taxing ideographic language, or by a cram system of education shaped with reference to passing competitive examinations. To those of us who question the atrophy of a race quality thru disuse and doubt if any amount of sterilizing education can quench the originality of a race beyond the generation submitted to it, it seems more likely that the contemporary Chinese intellect is sterile *because of the state of the social mind.*

It is true that the culture development of the Chinese ceased at stages no more difficult to negotiate than the earlier stages. In painting they never mastered perspective. In music they never achieved harmony. Their language is lacking in relative pronouns and other words indicating the relation of statements to one another. Their writing is arrested at the level of ancient Babylonia and Egypt. For many centuries, however, their psychological climate has been unfavorable to innovating thought. As well expect the apple tree to blossom in October as expect genius to bloom among a people convinced that the perfection of wisdom had been granted to the sages of antiquity. Before he has fairly begun to bring forth, the fresh thinker has been discouraged and intimidated by the leaden weight of conservative opinion about him. In a word, the social atmosphere has become oppressive, lacking the stimulating oxygen it had in the distant days when the Chinese invented gunpowder, block printing, bank notes, porcelain, the compass, the compartment boat and the taxicab.

The patent stagnation of the collective mind is due not to native sluggishness, but to prepossession by certain beliefs. These beliefs are tenaciously held because in their practical outworkings they have been successful. Under them vast populations have been able to attain order, security, and a goodly measure of happiness. Moreover, as these beliefs have expanded their circle of influence, they have never—until lately—encountered any system of ideas that could withstand them. Chinese culture has spread and spread until all Eastern Asia bows to it. Nestorian Christianity flourished there and vanished. The Jews of Kai-fung-fu lost their language and religion and became Chinese in all but physiognomy. The conquering Manchus have forgotten their language and literature. "China," it has been finally said, "is a sea that salts everything that flows into it." The guardians of a culture so vanquishing may well be pardoned for regarding as presumptuous any endeavor to improve on it.

For centuries the Chinese have found themselves in the situation our descendants will perhaps find themselves in when, half a thousand years hence, they are enfolded in the colossal body of a single self-consistent planetary culture; when scientific research shall have long been subject to the law of diminishing returns; when nothing but a thin rill of trifling discoveries will trickle from the splendid laboratories; when the elite of the human race will have forgotten the thrill from such fructifying new truths as our generation has enjoyed in the discovery of radioactivity, the germ origin of disease, natural selection, mutation and mental suggestibility. Then, per-

tapes, without any abatement of its powers, the intellect of our race may develop such unshakable faith in the soundness and sufficiency of its system of scientific knowledge and thought that nothing but intercourse with the Martians will be able to release it from the grasp of the established and arouse it to fresh conquests.

It is rash, therefore, to take the observed sterility of the Celestial mind during the period of intercourse with the West as proof of race deficiency. Chinese culture is undergoing a breaking-up process which will release powerful individualities from the spell of the past and of numbers and stimulate them to high personal achievement. In the Malay States, where the Chinese escape the lifeless atmosphere and the confining social organization of their own land, their ingenuity is already such that unprejudiced white men have come to regard them as their intellectual peers. Civil engineers will tell you that in a score or two of years, after bright Chinese youth have had access to schools of technology equal to those of the West, there will be no place in the engineering and technical work of the Far East for the high-priced white expert. In Shanghai, too, the clever Chinese are learning to play the game. They are rapidly getting into their hands banking, coastwise navigation, the cotton trade and other branches by which the foreigners there make their money; some deem it only a matter of time when white men will be unable to make a living by trade on the China coast, having been frozen out there as they are being frozen out in Japan.

To forty-three men who as educators, missionaries and diplomats have had good opportunity to learn the "feel" of the Chinese mind I put the question, "Do you find the intellectual capacity of the yellow race equal to that of the white race?" All but five answered "Yes," and one sinologue of varied experience as missionary, university president and legation adviser left me gasping with the statement, "Most of us who have spent twenty-five years or more out here come to feel that the yellow race is the normal human type, while the white race is a sport." The trend of opinion is that when the Chinese have become equipped with the Western arts and sciences they will match us in intellectual performance, altho some think that the gap in ability between the masses and the higher classes is much wider than it is in the West.

It is significant that superior white men of long residence in China often become too Chinese in point of view to be of much service to their governments. Sir Robert Hart was complained of as virtually a Chinaman. Many of the consular veterans in the China service are said to champion the Chinese way of looking at things as against the Western. It seems that little by little the civilization of the East invades and takes possession of them. In the finer Chinese they discover an outlook more comprehensive than their own, a broad tolerance and a philosophic patience that makes mock of the eager impetuous West.

The heart of the case seems to be this:

Since the discovery of America the West-European whites have overrun the West Indies, the Americas, Australia, Africa, the Islands of the Sea and Southern Asia, while their East-European brethren have occupied Northwestern and Northern Asia. During this expansion the whites have encountered hundreds of races and peoples before unknown to them; but in all this time they have never met a race that could successfully dispute their military superiority, contribute to their civilization, or dispense with their direction in political or industrial organization. Now, after three centuries of such experience, during which the white man has grown accustomed to regarding himself as the undisputed sovereign of the planet, he makes the acquaintance of peoples in Eastern Asia who are, perhaps, as capable as the whites, and who threaten to spread into areas he had staked off for himself. In any case, it begins to appear that the future bearers and advancers of civilization will not be the whites alone, but the white and the yellow races, and the control of the globe will lie in the hands of two races instead of the one.

MADISON, WIS.

# Breaking into Literature

BY JEANETTE L. GILDER

IT is the eternal cry of those who are not successful in literature that they are kept out by a conspiracy, because they are not known and because editors are only looking for names. In plain language, this is all poppycock. The editor is as keen to discover a new writer as a miner is to discover gold. He much prefers to find a big new author than to buy manuscripts from a big author whose reputation is already established. The reason is obvious. In the first place the new writer does not cost so much. (He will, give him time!) At first he hasn't a name to sell, he merely delivers the goods. Then the editor has all the joy of discovery. The list of authors whom I have discovered in the course of my editorial career is one of the pleasantest things that I have to look back upon, and I can say from personal experience that to turn the pages of a new manuscript, the name on the title page of which means nothing to me, as I have never heard it or seen it before, and to find something really good, is not only a pleasure but a keen excitement. I well remember the joy with which I read the first manuscript of John Oliver Hobbes's "Some Emotions and a Moral," and how quickly I saw that a new star had swung into our ken. I remember how, somewhat earlier, when James Lane Allen, as a young writer just trying his wings, sent a handful of essays to *The Critic*, my brother and I were just as excited over the literary style of that newcomer. A short time before this we had discovered Marion Crawford, who had not then become a novelist but was trying his hand along many lines of literary composition.

ELEANOR HALLOWELL ABBOTT
Author of "Molly Make-Believe"

Those disgruntled writers who feel that they are kept out of the magazines because they are unknown, not because their "stuff," to use the journalistic expression, is no good, have but to look back over the last few years to see the number of new names in the literary firmament. I take up a recent number of *The Bookman* at random and look at the list of "best sellers." Of the six there is "The Prodigal Judge," by Vaughan Kester; "The Broad Highway," by Jeffery Farnol; "Miss Gibbie Gault," by Kate Langley Bosher; "The Golden Silence," by the Williamsons; "Queed," by Henry Snydor Harrison, and "The Grain of Dust," by David Graham Phillips. Of these six books four are by new writers. Vaughan Kester had written one, possibly two, novels in the course of his short life, either of which had made any great success, tho they were given their chance. In "The Prodigal Judge" he came before the public virtually as a new writer; and his novel heads the list of "best sellers." Jeffery Farnol is an entirely new man. He had published a novelet a year or so before "The Broad Highway" appeared. For a year now "The Broad Highway" has led the list of "best sellers." Mrs. Kate Langley Bosher is a new writer. She has only two books so far to her credit, "Mary Cary" and "Miss Gibbie Gault." Mr. Henry Snydor Harrison has, in "Queed," written

his first book, and it made an instant success. So you see that even this small list proves that new comers are not only welcome to publishers, but are just as apt to be "best sellers" as any written by the veterans of the quill.

A year or so ago the most popular story was "Molly Make Believe," by Eleanor Abbott, a new comer. Miss Abbott, as she then was (she is now Mrs. Coburn), belongs to the well known Abbott family, many of its members famous as writers. She was a school teacher up to the time of her marriage. "Molly Make Believe" was a new idea in fiction. It caught the public fancy and now everything that Eleanor Abbott writes commands a high price and a ready sale.

One of the youngest of the new writers is Elizabeth Dewing. Mrs. Dewing has two novels to her credit, "Other People's Houses" and "A Big Horse to Ride." These are remarkable books to have been written by a young woman in her early twenties. They have made a decided impression, but they have not yet attained the distinction of being among the six "best sellers." That Mrs.

MRS. L. H. HARRIS ("CORRA HARRIS")

Dewing will ultimately see her name in this conspicuous list I can well believe, but she is not aiming at popularity; she is aiming to write of the things that interest her and for which she has reason to believe there is a select, if small, audience. When I say small, I mean comparatively small; a few thousand, not a few hundred thousand. Mrs. Dewing is a New York girl. Both of her parents are painters. Her father, Thomas W. Dewing, has long been one of our foremost artists, particularly in mural work, and her mother is a portrait painter of decided cleverness. Mrs. Dewing has written more or less for the magazines, poetry, fiction and essays, but of novels only the two named on previous page.

MONTAGUE GLASS
Author of "Potash and Perlmutter"

Within the last two years the name of Corra Harris has appeared on the title page of two books, "The Circuit Rider's Wife" and "Eve's Second Husband." To the readers of THE INDEPENDENT this lady has long been known as Mrs. L. H. Harris, the author of many striking essays, but not until these two novels were published did she enter the field of fiction. Both of these stories ran thru the columns of the *Saturday Evening Post* before they were published as books. I have had it from Mrs. Harris's own lips that the editor of that widely circulated journal accepted these stories at once. They never went begging, which shows that Mr. Lorimer has the proper editorial vision. Mrs. Harris is a Southern woman whose home is in Nashville, Tenn. Her husband, who died about a year ago, was a Methodist clergyman in that city. This is not the place for me to speak of the tragic death of Mr. Harris. I may only say that it has had a marked effect upon the writings of his wife and probably will affect anything that she may write in the future.

A new writer of a very different sort is Miss Edna Ferber. Miss Ferber is a young woman, not more than twenty-one or two at the present writing, and has published but one book, "Dawn O'Hara." She has, however, written a number of short stories, every one of which is very nearly a little masterpiece. One, "The Man Who Came Back," I consider a remarkable story, worthy to rank with the best of any American short story writer. Miss Ferber hails from the West. At present she is living in Chicago. She was a journalist in Milwaukee and she did newspaper work in New York, I believe. There are some critics who say that a journalistic training vitiates style, but as most of our best writers have first been journalists this statement can hardly be correct. I do not know, but I would venture to say that Miss Ferber did not have to knock very loud at the editorial doors before she was admitted. If you show me a writer with such a clear-cut style, with such a good story to tell, I will show you one who will not be long out of print.

Miss Zona Gale is another young writer who began as a contributor to the magazines. I remember one month some few years ago that Miss Gale had stories in eight of the leading magazines, a pretty good record for a young writer. Evi-

dently there was no one trying to keep her out. Since then she has written three books and is at work upon a fourth. The first, "Pelleas and Etarre," was not so popular as the two that followed.

MRS. MARY S. WATTS
Author of "Nathan Burke" and "The Legacy"

"Friendship Village" and its companion volume. In her Friendship stories Miss Gale hit the pace of Mary Russell Mitford. There is a truth and a homeliness about the Friendship villagers that appealed to a wide circle of readers. Like so many of these new writers, Miss Gale hails from the West. She served her apprenticeship in New York, but not long ago she left that noisy, hustling city behind her.

Mary S. Watts is another Western writer who jumped into the middle of the ring with her second book, "Nathan Burke." She had written a story before this was published, and while it attracted a certain amount of attention it did not attract as wide attention as "Nathan Burke," nor did "Nathan Burke" appeal to so large an audience as her next novel, "The Legacy." Mrs. Watts lives in Cincinnati and is the wife of a well known lawyer of that city. She had no special training as a writer. She wrote because she knew how, because she liked to. Of course, she was an educated woman and an observing woman; if she had not been the latter she never could have written "The Legacy."

One of the youngest and the newest writers of fiction is Miss Caroline Lockhart, who, up to the present time, is the author of one book, "Me-Smith," a remarkable performance for a woman, young or old. Miss Lockhart lives on a ranch near the small village of Cody, Wyo. She knows the subjects of which she writes from the inside; she is no carpet rancher. Her adventures in the open have been numerous and thrilling. She wrote "Me-Smith" because she wanted to write and because of the impression made upon her by the character of the original from whom she drew her leading character. Miss Lockhart's manuscript, if I am rightly informed, was accepted by the first publisher to whom it was sent.

The author of "Mary Cary," Kate Langley Bosher, found very little difficulty in getting that book, which was her first, accepted. Her publishers were more enthusiastic about it at first than was the public, but the public soon waked up and took "Mary Cary" to its heart;

MRS. SUSAN GLASPELL

and it was the Mary Cary in "Miss Gibbie Gault" that made that story popular. Mrs. Bosher is a Southern woman

MRS. KATE LANGLEY BOSHER,
Whose "Miss Gibbie Gault" continues "Mary Cary"

from Richmond, Va., which ancient and picturesque city she tells her friends is something better than paradise.

A writer of quite another sort, but who has made a reputation and a success with two books, is Miss Susan Glaspell. "The Glory of the Conquered" and "The Visioning" have won the sympathy of a wide audience. Her first novel reached a second edition before the day of publication, which is an unusual compliment. Miss Glaspell is also a Western woman, her home being in Davenport, Ia. She is fond of traveling, not only in her own country but abroad, but always returns to Davenport.

To turn our attention to some of the newly arrived writers of the sterner sex there is George Randolph Chester, the inventor of "Get-Rich-Quick Wallingford." Mr. Chester served his apprenticeship in journalism. From reporter he rose to Sunday editor and then he began to write stories. Six years ago he was unknown; today he is in receipt of royalties from five volumes of collected short stories and from two plays. He had no trouble in getting his stories accepted, for even while he was a Sunday editor he ran a newspaper fiction syndicate, for which he did all the writing. Mr. Chester writes about the plain people, the flats and the sharps, the types that every one knows or has read about in the newspapers.

Another writer who takes his characters from everyday life is Montague Glass. The firm of Potash & Perlmutter, of which Mr. Glass writes, has become almost classic. The truth to life of "Abe" Potash and "Mauruss" Perlmutter attracted editorial interest at once. Here were new characters but as old as the hills, absolutely true to life and amusing because of this very truth. "Abe" and "Mauruss" may be imaginary characters, but I think you will find them in almost any of the clothing manufactories on lower Fifth avenue.

If you had heard one of the firm that published "Queed" talk to me about that book before it was published you would appreciate what I have said in the first

HENRY SNYDOR HARRISON
Whose "Queed" is a "First Book" that calls for no apologies

part of this paper on the joy of an editor or a publisher in discovering a new writer. "Queed" is the first novel of Henry Snydor Harrison. Mr. Harrison, like Mr. Chester, learned his business in journalism. He was a reporter on a New York paper, but all the time he was writing copy for his newspaper he was piling up material in his mind for a novel. It is not every publisher that would have taken kindly to "Queed" at a first glance, but fortunately for Mr. Harrison he knocked at the right door.

I have only mentioned the new American writers in this paper. If I had crossed the water and gone into England, I could have mentioned the extraordinary leap into popularity of Mrs. Barcley with "The Rosary" and Mr. Jeffery Farnol with "The Broad Highway," two shining examples of successful first books.

New York City.

# The Insurgents at Albany

BY EDMUND R. TERRY

[The following article is by one of the insurgents of the New York Legislature, the Assemblyman from the First District of Kings County (Brooklyn). Mr. Terry was a classmate of President Taft at Yale and his frank article will be read with as much interest outside the State of New York as within.—EDITOR.]

INSURGENCY has been described as a state of mind. Early in January, 1911, there were in the Assembly at Albany a number of newly elected members in just that condition. Most all of them had been elected as Democrats from districts normally Republican, and to achieve that result it is always necessary to put in nomination men of character and standing in the various communities, the kind of men that are prone to rebel at any use of a party lash.

The day of the Inauguration, judging from the expression of opinion from the Democratic members from all over the State, it seemed as if Mr. Shepard's chances of election as United States Senator were excellent, provided the free unhampered expressions of the opinions of the legislators were allowed to determine the election.

When we organized, two days later, on the 4th of January, in consequence of Mr. Murphy's proclamation, it began to be evident that the Tammany votes were to be cast *nolens volens* for Mr. Sheehan.

The night of the 4th of January, the Assembly organized by the selection of the Speaker, clerk and other officials and adjourned until the following Thursday, when, in accordance with custom, it was expected that the committee appointments would be announced for the Assembly as well as for the Senate. When we assembled on that Thursday night, it became evident that many of the Up-State representatives, acting as we understood under the compulsion of their State Committeemen, and because of promises or threats in regard to patronage, and so forth, had changed over to Mr. Sheehan. Contrary to custom, the committee appointments were not given out that night, and it was clearly intimated that it was proposed to hold up the appointments together with the incidental patronage until Mr. Sheehan's majority was assured. This was the last straw.

By this time a feeling of intense resentment at conditions had spread among many of the Assemblymen; not only among those friendly to Mr. Shepard, but also among those who favored other candidates. I found that my two neighbors, McDaniels and Myers, were so hot that they exprest themselves confidentially to me as being about ready not to enter the caucus if Mr. Sheehan was to be the nominee. I had heard about Evans of Sullivan, and from my own

conversation with him I learned that his disgust with existing circumstances was in direct proportion with his zeal for Mr. Shepard, which was whole-souled and ingenuous. His next-door neighbor, as desks were arranged, was Trombley of Clinton, whom I had also met and of whom I had heard enough to satisfy me that he was to be depended upon; both had served the previous term in the Assembly. I went back to where they were sitting and had a very confidential talk with them, and finally suggested to them that if we could get eighteen men in the Assembly we could break the caucus, prevent Mr. Sheehan's election, and be sufficient in number to protect ourselves in any legislation in which any of us might be interested.

They saw the point at once and told me to come back in half an hour. Upon my return they said to me, "We have got eight men; what can Kings County do?" I told them I was afraid that Kings County would do but little, but that I could speak for myself and probably Fry. We then all laid our heads together and going over the various names in the Clerk's Manual we carefully selected three others. Fry I had seen in the meantime and had his assurance that he would not go into the caucus. We thus had fifteen men that night who had been carefully picked, all of whom persisted to the end, and we knew of others. At that time we were conspirators, and to have included in our number a weakling or a tattler might have ruined us. Those men we took were carefully sounded and talked to before the proposition was made. We might have had a larger number, but we had enough. There were Beach of Tiago, Brace of Montgomery, Cosad of Seneca, Bridenbecker of Herkimer, Day of Jefferson, Drummond of Cayuga, Evans of Sullivan, Fry of Kings, Martin of Saratoga, McDaniels of Tompkins, Miller of Otsego, Myers of Schenectady, Terry of Kings, Trombley of Clinton and Wheeler of Delaware. Most of them went home that night, or the next day, Friday, with the understanding that they were to meet again about five or six o'clock of the following Monday, either at Shepard's headquarters in the Ten Eyck or at some other headquarters to be selected by those who stayed over. In the meantime, Thursday night, notice was given at Mr. Murphy's headquarters that there were eighteen or twenty Assemblymen who under no circumstances would vote for Mr. Sheehan; and who, if necessary to avoid that, would not go into the caucus. The same notice was given the next day to the Governor and to Mr. McCooey. These notices were given with the knowledge of those interested, for we did not want to be accused by the leaders of taking them by surprise.

An incident that took place Friday will demonstrate how entirely the movement originated and developed among the Assemblymen themselves. Two of those who had agreed Thursday night to stay out of the caucus happened the next day to be at the Shepard headquarters in the Ten-Eyck Hotel. Mr. Hare, who was there with several others, had obtained from Assemblyman Drummond some inkling of the proposition. Mr. Hare asked one of the visiting Assemblymen in very dramatic fashion if he would stick to the program of not entering the caucus. He made no answer, and upon Mr. Hare repeating his question with even greater impressiveness, replied that he did not know whether he would or not, and that it was a matter that required considerable consideration. Mr. Hare was displeased and left the room with the others, leaving the two Assemblymen alone. As soon as the door was closed, the man who had refused to answer Mr. Hare turned to his fellow Assemblyman, Brace of Montgomery, and said: "Brace, you are an Assemblyman, you have your neck in the halter with me, you have a right to know. Of course, I will stick, but it is none of those fellows' infernal business." This may illustrate somewhat the feeling among us, that grew as the days went on, and may be one explanation of why we all "stuck."

There was in the minds of all of us a resentment at the unfairness with which the candidates, other than Mr. Sheehan, had been treated, but the real feeling that animated us was deeper than that.

We felt that by our election by the votes of our respective districts, and

by our oaths of office, certain duties were imposed upon us that we could not conscientiously permit any one else to perform for us. That while we believed in party organization, yet, when party organization undertook to interfere with the functions entrusted to us by our people under the Constitution, the organization was transcending its proper and sane limitations.

No member of the Legislature should allow himself to be placed by the action of a party caucus in a position where he is compelled to vote contrary to his conception of his sworn duty to the constituency that has elected him. His oath of office should prevent him.

For various reasons, that it would be fruitless now to discuss, we did not think that we could conscientiously elect Mr. Sheehan to be Senator. For that reason we refused to enter a caucus of which he might have been and was the choice. Besides, we have never thought that the votes by which Mr. Sheehan's majority in the caucus was obtained were free and untrammeled expressions by the representatives of the desires and aspirations of their constituencies.

On the eventful Monday for which the caucus was announced it was decided that it was better for us not to meet at the Shepard headquarters, and by some of those who were there it was broadly intimated that we were not wanted, so we established our headquarters at room No. 103 in the Hampton Hotel, which was taken Monday by Assemblyman Freeman, who joined us that day, as did also Holman of Nassau and Saunders of Columbia. Several Senators, including Senator Roosevelt, also became interested in the proposition at that time. A conference was held at three o'clock at the Hampton, and this was the first time that the Senators were brought into the movement. At this three-o'clock meeting there were only five or six Assemblymen and five Senators, only one of whom, Senator Roosevelt, at that time had joined the movement. The matter discussed there was whether the Governor really desired to have us stay out of the caucus or not. With four of the Senators that seemed to be decisive upon their action and two of them threw up the sponge. Senator Roosevelt with two others went to the Executive chamber and was there informed by the Governor that as Executive of the State he could advise no member of his party to keep out of the party caucus. Senator Roosevelt, despite the fact that he knew, or had heard, that the main body of the Insurgents, as we were afterward called, were not expected until nearly six o'clock, in a very despondent mood returned to the Hampton Hotel and exprest his fear that the whole movement had collapsed. He did not know the men and had little reason for confidence.

Just as was expected, all the Assemblymen who were in the previous compact came in to the later meeting and in addition there were the two Senators, Roosevelt and White. Senator Burd was also present, and while he was loyally with us all thru, he did not sign the agreement signed about six o'clock by all the remaining twenty. Considering the nature of our enterprise and the fact that we were all then comparative strangers to each other this written agreement seemed only a right and proper precaution. That agreement, let me say here, was not sworn, sealed or witnessed and merely stated that we would not vote for Mr. Sheehan, for United States Senator, during the session of 1911. We called it our Declaration of Independence. That agreement was virtually embodied in the first and only statement that as a body we ever sent out.

About seven o'clock, feeling that we had done something, the exact result of which we were very uncertain about, we left the headquarters and repaired to our various eating places to eat such dinners as our nervous condition would permit us. The regular sessions of the Senate and of the Assembly were called at half past eight. In each House the session was brief and perfunctory. The caucus was to be held in the Assembly Chamber after that body adjourned. During the session the committee appointments were given out by the Speaker and the Insurgents did very well. As soon as the motion to adjourn was made, every Senator and Assemblyman in the compact withdrew from the place appointed for the caucus. It would be amusing if there were space to

describe the manner of the going of the individual men; it is sufficient that they went. By previous arrangement we had agreed to meet at our room in the Hampton. Senator Roosevelt and I were the first to arrive and for ten long minutes, that seemed like hours, we assured each other that there was no doubt of the speedy arrival of the other eighteen. Within half an hour all the twenty had arrived, somewhat to our relief, and the defeat of the caucus was accomplished One reason for our meeting was the expectation that when on the roll call it was found that we had meant what we said, and that by lack of numbers the caucus was ineffective, some agreement would have been arrived at that night. In this we were disappointed; so we spent the evening in discussing the situation and settling our future course. We also effected the only organization that we ever had by informally appointing Senator Roosevelt to be our chairman, a selection the wisdom of which subsequent events abundantly proved. He presided in a most informal way at our subsequent meetings, which we held at ten o'clock every morning and five o'clock every afternoon. Whether we had anything particular to discuss or not, we met. Many times we had much to discuss, for from the first we made it a rule to have no secrets from each other and anything said to either of us was in effect said to us all. This may explain why some of the neat pitfalls prepared for our undoing failed of their purpose. As we met day after day, we began to know each other better and better, and with that increasing acquaintance our mutual confidence and respect increased day by day, for every one of us knew that not a man of us had any ax to grind or was working for any outside interest. It is true that many of us had pleasant and intimate personal relations outside of legislation with various men prominent in the party whose advice was frequently asked and sometimes acted upon, but no one outside of ourselves was ever authorized to speak for us in any way whatever.

The first days of our insurgency were indeed strenuous. Morning, noon and night we were subjected to argument, expostulation, entreaty and the solicitation of personal friends, which is the hardest and most trying attack to withstand. Objurgation and threats, of which there were plenty, are easy to meet. It may be an admission of weakness, but many of us found that absence from our accustomed haunts was the easiest method of escape. What was the use of trying to argue with men who were our friends, whose opinions were nevertheless absolutely irreconcilable with our own? It could only result in unpleasantness and lasting animosity. One man, after a three-hour siege, turned upon his State Committee man, and a delegation of four or five with him, with the caustic remark, "Gentlemen, argument is exhausted, you can go to blazes." To be truthful, he did not say "blazes."

Our treatment by our fellow members was exceedingly considerate, and all the way thru we could not but have the feeling that while they differed with us in their conception of our political duty we had their full respect. During the first weeks, our meeting place in the Hampton was a haven to us. We did not always discuss political matters nor the particular venture in which we were engaged. We found that hardly a man among us was not a good story-teller and many of our sessions were occupied with nothing else. I remember once after such a session when we told two newspaper men that there was nothing to report, we received the answer, "For secrecy, the Insurgents had the Black-Hand beaten a mile." After all we had but little to report. The reporters for a while devoted all their energies to the difficult task of discovering what individual or what interests were behind us, and as there were none it was difficult to ascertain. We needed no backer. Our total expense including a wedding present for one of our members and a loving cup for our chairman was less than fifteen dollars apiece, and I ought to know, for all the money that was paid went thru my hands. The lobster suppers eaten from plates of gold took place only in the imagination of the most imaginative of all the newspaper correspondents. Some have wondered how it was that we were so persistent in our attitude. The impression was given out at first that we were all a lot of boys in-

dulging the exuberance of our youth. As a matter of fact the average age of the twenty who signed was nearer fifty than forty. They were men who understood fully the significance of their act and were prepared to meet all its consequences. There were others who also did not go into the caucus: the representatives of the Independence League, Assemblyman O'Connor of Kings, and Senator Duhammel from the same county. There were also Assemblymen Huber and Kennedy of Queens and Senator Saxe of New York. At first none of these attended our conferences, tho they acted in full accord in the attainment of our common object. Senator Saxe was never with us until the very last few days. After the first vote that showed the caucus to be ineffectual, Assemblymen Chanler, Hoyt and Shortt and Senator Loomis, acting in accordance with the well-established Cassidy rule governing caucus obligations, joined us in voting against Mr. Sheehan. We did not think it advisable to unite upon any candidate, for we could not take the position of dictating our choice to the majority. We merely tried to show by the men that were named at different times by one or the other of us, the character of man for whom we would willingly vote if presented by the other side. There were various propositions looking to a settlement that came to naught. Six or seven weeks before the final settlement the suggestion was made to fourteen or fifteen of us individually that we should accept Mr. Cohalan. In the case of each Insurgent, the proposition was made that in the event of eleven others agreeing to vote for Mr. Cohalan he would follow suit and that a new caucus would then be held and Mr. Sheehan's name would be dropped. But this proposition was promptly rejected by every one of the Insurgents. There were various other matters that required our careful consideration. Several times, stung by newspaper criticisms, we prepared elaborate statements defining more fully our position, but on careful consideration we concluded that to give them to the press would only give rise to interminable discussion. It is hard to hang anything on a blank wall, but once put a nail in the wall and no one can tell how much can be hung upon it.

The statement that our opposition to Mr. Sheehan was because of his race and religion, which by the way emanated from the candidate himself, we answered after much discussion among ourselves by proposing the name of the Hon. John D. Kernan, whom we were all ready to vote for. The utter baseness of that charge against us is shown by the fact that three of us belonged to the Catholic order, the Knights of Columbus, and three or four were Irish.

During the entire contest hardly one of the Insurgents missed a single roll call. Republicans and our Democratic opponents could pair off, there was no one with whom an Insurgent could pair and there were times when the absence of any of us might have worked havoc with our plans. The joint session met every day but Sunday. This required a good deal of self-sacrifice. One of our number, Drummand of Cayuga, was married early in the session; the marriage was on Friday and Monday night he was back at his place. Another, Myers of Schenectady, had a daughter dangerously ill with pneumonia. During the critical part of the time he never missed a roll call. Evans of Sullivan had a similar experience. If there were space I might recount all the pleasant things that were done for us by our sympathizers, in Albany and elsewhere, all of which tended to weld us closer together.

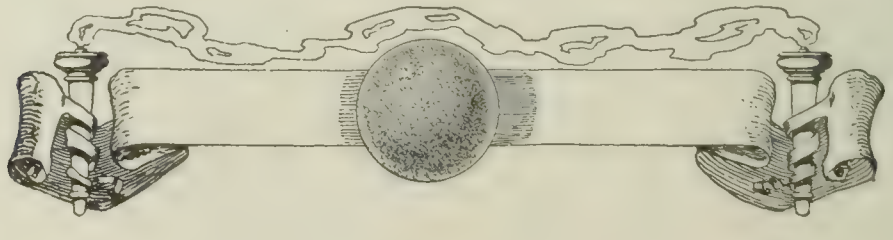
Too much cannot be said of the untiring zeal and efforts of Senator Roosevelt to advance our cause. While not, in the ordinary sense of the term, leader, as everything that was done and every step taken came after a full and free discussion by all of us, nevertheless, we had to have some one to represent us and to speak for us, and Senator Roosevelt was the man to do it. During the time when we were hounded and harassed, he was the shepherd of the flock, and his house was indeed during the early days a harbor of refuge nearly every evening.

The conflict dragged on, week succeeded week, and month after month went by, until the 4th of March arrived and the State of New York had

but one Senator at the National Capitol. It was recognized by all that something must be done. The Extraordinary Session of Congress had been called early in April, and it would have been a scandal had New York been represented by but one Senator. There were propositions and counter propositions; four names were presented and rejected. In the meantime some of us had begun to despair of ever being able to come to a satisfactory compromise with Tammany as represented by Mr. Murphy. Tentative negotiations had been entered into by some of the Insurgents, on their own responsibility, with the Republicans. At this juncture, for the first time, Mr. Francis L. Stetson had to do with the matter. He appeared as a voluntary intermediary between the Insurgents and the Republican organization, having been asked to do so by some of the former. There was no element of bargain in the arrangement proposed. We were to make up our minds as to what man we would all vote for, and if our selection was satisfactory to the Republicans, their vote would be cast for the same candidate. Four names were suggested by us. One of them Mr. Stetson at once said it would be useless to present; of the other three, he was certain the Republicans would accept Mr. Osborne. Another, that of Mr. Littleton, he had no confidence in their taking, nor would he say that they would refuse him. A large number of us did not like the idea of Republican alliance anyway, and at the same time we did not wish to reject the offer, so we unanimously decided upon Mr. Littleton, and Mr. Stetson presented his name to the Republicans. We had all met at Senator Roosevelt's house and it was after considerable discussion that Mr. Littleton's name was unanimously selected. Mr. Stetson left for a conference with the Republicans, and after an absence of an hour and a half or two hours, returned with the message that, as he feared, they would not accept Mr. Littleton as the candidate. Expressing his regret that such had been the outcome, Mr. Stetson left us and that night took his departure for New York. That was his sole connection with the Insurgents as a body at any time.

In the meantime the Democrats had been holding a caucus in the Assembly Chamber, which broke up late that night without arriving at any conclusion. At Senator Roosevelt's hearing nothing from the others, we adjourned about one o'clock. That night the fire broke out in the Capitol, and everything was consequently in disorder and confusion. The next day nothing was accomplished, but we had satisfied our opponents as to whom we would not take.

The selection of Mr. Sheehan as the candidate of the regular party caucus had in the meantime been rescinded by another caucus. Thursday afternoon and Thursday night further negotiations were held. The Insurgents finally presented ten names, any of whom we would accept. Among these names were those of Isadore Straus, Augustus Van Wyck, John D. Kernan, D. Cady Herrick and others of equal prominence. At the suggestion of the Democratic leaders the name of Supreme Court Justice Victor Dowling of New York City was added to the list and it was understood that his would probably be the name presented, and we all felt that the matter would receive a happy solution by his selection. So we adjourned Thursday night expecting that the next morning we could all go into the caucus at ten o'clock, with the understanding that we would not be bound to the result if any other name than that of one of the eleven should be selected. The next morning we met at Senator Roosevelt's at nine o'clock and heard for the first time that Judge Dowling had refused to accept, and that the name of Judge O'Gorman had been substituted as the name to be acted upon at the caucus. This announcement put everything up in the air again, and only two of our number went into the caucus. Most of us remained at Senator Roosevelt's house. The caucus had been called for ten o'clock, and as none of us appeared, it was adjourned until two o'clock in the afternoon. Senators Frawley, Murtaugh and Ferris called upon us to urge our acceptance of Judge O'Gorman. On this proposition we took a vote, which resulted in eighteen to six against doing so. In the meantime we were hearing a great deal about Judge O'Gorman. Many of us had thought



from the beginning of the contest that he would be an admirable selection. When a man had received an appointment, as he had, as Associate Justice of the Court of Appeals, and every member of that court, irrespective of party, had written him a personal letter urging his acceptance, to talk against his fitness would have been silly. Some of us voted against him realizing that in the state of mind in which most of our associates were, we could not bring them around to vote for the angel Gabriel, and that it was better to vote in the negative, and so be in a position to change to the affirmative at the psychological moment. That moment arrived when, as a last resort, Mr. Murphy sent to the Insurgents Senator Wagner, the Democratic leader of the Senate, and Assemblyman Smith, the majority leader of the House, who urged and besought us, for their sake and for the sake of the party and the country, to accept Judge O'Gorman. In the meantime we knew that the Sheehan forces were all ready to unite with the Republicans in the election of their candidate, and we knew also that it would have been easier for them to have obtained from the Republicans enough votes to elect Mr. Sheehan than it would have been for us to have elected any man we might have suggested with Republican aid. As we had always said that we would accept a good Tammany man if he were presented in a proper way, and as some of us had said to outsiders very early in the contest that we gladly would accept Judge O'Gorman as a candidate, we could not longer reasonably refuse, and accordingly several of us changed our votes as taken earlier from the negative to the affirmative, the others all followed suit and enough of us went to the caucus to insure the selection of Judge O'Gorman. It needed our aid to accomplish that. At the joint session that followed immediately after the caucus, James A. O'Gorman received the votes of all but three of the Democratic members of the Legislature. Two of them, Insurgents, had been called away from the city by imperative personal matters. The object for which we had banded together had been accomplished.

It has been said by some that, after fighting those weeks and months, we finally surrendered to Tammany Hall. A cursory examination of the facts belies that statement.

In the interests of good government we forced the reversal of a caucus that had not sufficient numerical strength to make its results effective or binding. We caused the withdrawal of the candidate whom we opposed. We effected the final selection of a man whom Governor Hughes and all the judges of the Court of Appeals had signally honored; who we felt was thoroly qualified for the position; whom Governor Dix urged us to take; who we understood was approved by our friends, and for whom those of us who enjoyed his personal acquaintance had the highest regard.

Whether or not the election of James A. O'Gorman, to represent the Empire State in the Senate of the United States, was the final word of the spirit of our insurgency remains to be seen. The "state of mind" in the Legislature has certainly been invigorated by our action. The newspapers may not concede it, but the "bosses" know it.

## Fashions in Fiction

Some seasons have been observed to produce a fashion in fiction as pronounced as the cut of skirts and sleeves; others more strikingly suggest the occasional comforting assurance of the "What-They-are-Wearing-in-Paris" correspondent that "there is such a diversity of modes that every woman may find something to suit her peculiar style." So far as late summer modes in fiction are indicated by the decade of novels which synchronous issue has grouped upon the reviewer's table, the latter parallel seems the more apt, and readers of varied tastes may open them with more lively hope of gratification than perhaps can be entertained regarding September fashion plates.

Of the ten books one is a story of modern English life, one a tale of missionaries in China, four—a rather striking proportion—are historical novels, and in the four portrayals of American life the sketches of Milwaukee and rustic Virginia are not more unlike than the two which paint rural and urban New York.

*Esther Damon*[1] lives the most momentous years of a life as little touched with bright color as her gray Methodist gown in a tiny New York village, yet the story of a narrow and self-satisfied community deals in a most arresting fashion with some of the deepest problems of humanity. The hero is a drunkard, the heroine a "fallen" woman, but except to that squeamish niceness which forbids the sot in the gutter and the "guilt" of a woman betrayed to be named in audible voice or clear print, this book will seem one of unusual interest and power. Certain characters and theories are perhaps exaggerated. Whether a Methodism so primitive and narrow existed in New York so late as the middle seventies, whether a "Republic" such as Robert Orme's could have succeeded then or since, may be questioned, but it is a certain tendency to the superlative in their manifestations and results, and not the existence of the spirit animating each, that challenges belief. There is no question of the author's descriptive powers. Such scenes as Robert Orme's last "drunk" and the Methodist camp-meeting are unforgettable.

Next to *Esther Damon* in the ability to compel thought at the same time that it holds the interest is the Chinese missionary story whose title, *The Unknown God*[2], in no way indicates the nature of the book. Much more unknown to the reader is its author's real attitude toward Protestant mission work in China, inasmuch as there are suggestions of everything from a sort of critical hopelessness and sense of futility to a real sympathy and occasional admiration. Aside from this it contains a slightly unusual love story, a vivid account of a native attack upon a mission station, much well-written description of Chinese life and landscape, and some rather nasty intrigue in which a missionary and a high English official divide honors as leading villain.

*The Miller of Old Church*[3] is to-day's educated and ambitious variant of the Virginia "poor white." One of the sons of the generation molded by antebellum conditions, he lives among its still numerous survivors, of them and yet above them. Upon the whole, the best things in the book are of his elders. The shrewd wit and philosophy of their moral and religious disputations really attract more than the triple—or quadruple—love affair unfolding among their children and aristocratic neighbors. But it is the most aristocratic of the neighbors, a middle-aged and very typical Southern lady, who achieves the tragedy of two generations thru that form of goodness in whose delicate pres-

[1] Esther Damon. By Mrs. Fremont Older. New York: Charles Scribner's Sons. $1.25.

[2] The Unknown God. By B. L. Putnam Weale. New York: Dodd, Mead & Co. $1.45.

[3] The Miller of Old Church. By Ellen Glasgow. New York: Doubleday, Page & Co. $1.45.

once the immoralities of society are forbidden mention, and whose combination of frail health and hard and narrow purity two men fear to face with confession and restitution for their wrongdoing. It may be suspected that Ellen Glasgow is a bit heterodox as to both Calvinism and "the womanly woman."

*Dawn O'Hara,* "The Girl Who Laughed,"[4] is less trivial than its title suggests. It is a lively story of a woman newspaper reporter, with sufficient intermingling of pathos so that the reader, unlike Dawn O'Hara, does not always laugh. But neither, as a matter of absolute fact, does the heroine. A notable originality of the book is that its scene in Milwaukee, hitherto much neglected in fiction.

*Thurley Ruxton*[5] is the unworthy production of a pen capable of something better—a novel which most suggests a sadly overdone Anthony Hope creation, without the Anthony Hope charm. The plot is as preposterous as the heroine's fatal beauty, and the constant overstrain of language and incident makes ineffective the little that is good.

*The Old Dance Master*[6] is an eminently readable story of London life in some three social strata. Serious matters are touched lightly, and rather to give piquancy to the plot than to promulgate theories. And better than the plot are the descriptions of the delightful, child-like, profoundly learned old Viennese dancing-master, and the friends high and low whom he makes in his vicissitudinous career.

The four historical novels extend in time from Leonidas of Sparta to Charles II of England, in geography from farthest India to The Hague. And they do not quite fulfill the mathematical requirements in that the chronological means equal the extremes. Inability to withstand the temptation to sugar-coat a very large pill of information with exceedingly thin romance has made *The Royal Pawn of Venice*[7] a rather dull book, altho it has the merit of dealing with a place and period new to fiction's uses—Cyprus in the fifteenth century under the pitiful girl queen who was made a sacrifice to Venetian ambition. Marjorie Bowen has avoided the above-mentioned pitfall, and made *Defender of the Faith*[8] a well-told and very human story of that part of the life of William of Orange just preceding and just following his marriage. The two books dealing with more ancient times are alike only in the fidelity with which each reflects the spirit of the time and people it depicts. *The Coward of Thermopylæ*[9] is like the pure and stately art of the ancient Greece-its hero loved; *The Downfall of the Gods,*[10] a strong but unpleasant book, reeks with the impurities of that Oriental land for which a hero attempted great things because he loved not it, but a woman. Under that inspiration he compassed the overthrow of the Brahmans and their impotent deities only to make way for anarchy and atheism. On the other hand there is no love-story in *The Coward of Thermopylæ,* save that of man for man, but it is curiously touching as it traces the struggle of a poetical Athenian spirit to harden itself to the brutal Spartan ideal of courage. Perhaps it is after all in this book of a time so very old, which makes so strong an appeal in its classic simplicity, that we find the very newest fashion in our display of fresh autumn fiction.

**Kennedy Square.** By F. Hopkinson Smith. New York: Chas. Scribner's Sons. $1.50.

There is no disappointment here for Mr. Smith's friends—and many they are. It is the atmosphere and the setting of his most successful tales—a Southern town "before the war," with stately mansions, romping children, old black mammies in aprons and bandannas, hard-riding young men who fight duels and ravishingly beautiful young women who indirectly occasion them, fine old gentlemen dressed in clothes sent out

[4] DAWN O'HARA, THE GIRL WHO LAUGHED. *By Edna Ferber.* New York: Frederick A. Stokes & Co. $1.25.

[5] THURLEY RUXTON. *By Philip Verrill Mighels.* New York: Desmond Fitzgerald. $1.20.

[6] THE OLD DANCE MASTER. *By William Romaine Paterson.* Boston: Little, Brown & Co. $1.25

[7] THE ROYAL PAWN OF VENICE. *By Mrs. Laurence Turnbull.* Philadelphia: J. B. Lippincott Co. $1.50.

[8] DEFENDER OF THE FAITH. *By Marjorie Bowen.* New York: E. P. Dutton & Co. $1.35.

[9] THE COWARD OF THERMOPYLÆ. *By Caroline Dale Snedeker.* New York: Doubleday, Page & Co. $1.20.

[10] THE DOWNFALL OF THE GODS. *By Sir Hugh Clifford, K.C.M.G.* New York: E. P. Dutton & Co. $1.50.

from London and devoted to practising the graces of life and to smoothing the path of their juniors. Mr. Smith's impression of the period of *Kennedy Square* has quite as much of legend as

garity. We like his St. George Temple —just as every one in the Baltimore of his time did. And as we close *Kennedy Square,* we can't help half regretting the romance of an older and less progressive

ONE OF A. I. KELLER'S ILLUSTRATIONS FOR F. HOPKINSON SMITH'S "KENNEDY SQUARE"

of history about it. At least, he records it with his usual charm. He is a born story-teller, and will never wear his welcome out. He describes eating and drinking with greater effect than any living author. (We regret his dragging in Poe—even to preach a temperance sermon, as it were.) Mr. Smith confers gentility upon a character as readily as other novelists impart vul

civilization that is so appealing, enjoyed thru books.

**Dionis of the White Veil.** By Caroline Brown. Boston: L. C. Page & Co. $1.50.

The story opens at New Orleans in the year 1725. It is a picturesque setting that history provides; so picturesque, indeed, that one somewhat deplores the

rococo style indulged in by the author, whose red men have "muscle-matted torsos," whose King Lewis (ætat. 15) has a "jaded fancy" and a "sated court," and whose ladies (for the scene shifts from the New World to Versailles) feel on the slightest provocation "delicious tremors of fear titillating down their spines." Dionis de Montfort, to be sure is an exception. We make her acquaintance as an Ursuline novice, *en route* for the wilderness. She is young, beautiful, and rebellious. Brother Chabet is almost equally young, almost equally rebellious. But she breaks short her novitiate in mating, not with Chabet, but with dashing Etienne Fauchet—courtier in France, woodsman and fur-trader in New France. A preposterous, diverting tale of nimble *coureurs des bois*, Breton cut-throats, sea pirates, murdering savages, portly nuns and somber Jesuits.

"WE MUST HAVE BEEN A GREAT PAIR"
An illustration by George Brehm for Sewell Ford's "Torchy" (Clode)

**Such a Woman.** By Owen and Leita Kildare. New York: G. W. Dillingham Company. $1.20.

*Such a Woman,* by the author of that tender story of the East Side, "My Mamie Rose," has the pathos of unfinished work, as the manuscript was incomplete at Mr. Kildare's death. The story has been finished by Mrs. Kildare. There is much that is brutal in its descriptions of the degradation among the people whom a young city missionary tried to help by starting a "Wayside Inn" settlement, the account of which is interesting as it embodies Mr. Kildare's theories of social work and the way in which to approach the people whom he knew so intimately. His fierce resentment of patronage one can well understand. His prejudice against many people who "go slumming" for excitement or to fill vacant minds is bitter; so he does scant justice to the greater number of those whose money supports missions and settlements, simply because they are anxious to relieve suffering and to help the children in congested neighborhoods and for no other reason whatsoever. Hence his report of the meeting of the patrons of the "Wayside Inn" is pure caricature. The complete transformation of Nora, drunken and hardened as she is at the beginning, is not unprecedented; but her marriage to the missionary at the end sounds a false note, and

injures the artistic effect of the book, which has some striking scenes and a power of realistic description of the brutality of drunkenness in man and woman which Owen Kildare hated as a strong man can.

**Torchy.** By Sewell Ford. New York: Edward J. Clode. $1.25.

Sewell Ford does not interpose his own personality between his carrot-topped hero and his reader. That hero, whose autobiography opens with his engagement as office-boy by a wild-cat mining promoter, is a child of Manhattan, stamped with that city's qualities and faults. Some will revel in Torchy's humor—others will shudder at his vulgarity. It is at any rate the essential vulgarity of the scene and its actors, such as may or may not please in its picturesque phrasing and uninvited repartee, but which is, none the less, the *genius loci*. Torchy is more clever than well-bred, and the last thing in the world which he would think of keeping is "his place." On the contrary, by not keeping his place, or any consciousness of it, he rises in the world—after the fashion of story-book heroes. His apologists will observe that his heart is in the right place, as also that he has a head on his shoulders. *Torchy* is to the metropolis what "David Harum" was to rural New York.

ONE OF MR. GIBSON'S ILLUSTRATIONS FOR R. W. CHAMBERS'S "THE COMMON LAW"

**The Common Law.** By Robert W. Chambers. New York: D. Appleton & Co. $1.40.

A new story by Chambers does not require a review; all that is needed is an announcement, especially for one that is known to a hundred thousand readers before it gets into covers. Like Anthony Hope, H. G. Wells and other novelists of the day, Mr. Chambers in this latest work considers the question of possible deviations from matrimony and comes to the sensible tho not surprising

conclusion that it is better not for women to experiment with novel forms of the relationship, but to obey "the common law," however arduous it may be in individual cases. He works out the theme in his characteristic style, continually leading up to suggestive situations and deftly dodging them in the end. It is curious to note that in the class of society which he describes it is snobbery that is the foe of morality, and a violation of etiquet is worse than a sin.

**Mrs. Thompson.** By W. B. Maxwell. New York: D. Appleton & Co. $1.30.

Mrs. Thompson is a new woman in fiction. She is forty-five when we meet her in her great shop, Thompson's, in the town of Mallingbridge; her hair is silvered when we leave her beside her granddaughter in the old pew at St. Saviour's, reciting the responses in her resolute voice; but she is always the dominating figure wherever she may be. The woman in business has had scant attention from novelists hitherto; in *Mrs. Thompson* she has come into her own. The strong brain, the clear head, the upright honesty, the faithful industry, of a genuine woman of business who makes a success of her enterprises have not been chronicled since the author of "Proverbs" described the efficient Jewess who considered fields and bought them, who managed and wrought long ago, and whose works were to praise her in the gates, until Mr. Maxwell gives us this masterly portrait of a middle-aged Englishwoman, who, against heavy odds, conquers her business and her town by sheer force of financial acumen amounting to genius. Mrs. Deland, in "The Iron Woman," draws a woman mastered by her business. Mrs. Thompson masters hers. She is a loving mother, a devoted grandmother, a generous friend and a personable figure in society, as well as the center of "Thompson's" activity. A curious recrudescence of youth, long repressed by her exacting work as head of a large department store, leads to her marriage, at forty-five, to a favorite clerk, a man of twenty-seven. He proves wholly unworthy of his promotion and of his wife's generous autumnal affection. The way in which Mrs. Thompson-Marsden shakes herself free from the hyphenated unhappiness of her marriage, and the business complexities caused by her husband's evil habits and utter lack of managerial ability, is unusual and makes an engrossing story of that part of life where most stories end, but we care less for the plot than for the character of Mrs. Thompson, who never loses our respect and admiration, even when she makes her absurd choice of a second husband. Her heart is tender to all who make the least response to her affection, and her essential womanliness, while it makes her the easy prey of a scoundrel, endears her to the reader, while her genius for finance compels respect. By a curious coincidence this book appears simultaneously with Karin Michealis's "The Dangerous Age," which is constructed on the same theme, but treats it in a way offensive to Anglo-Saxon taste.

W. B. MAXWELL
Author of "Mrs. Thompson" (Appleton)

**The Secret Garden.** By Frances Hodgson Burnett. New York: Frederick A. Stokes Company, $1.35.

Mrs. Burnett has the happy gift of understanding and being able to speak to children in her books. *The Secret Garden* is a worthy successor to "Little Lord Fauntleroy" and "Sarah Crewe." To more sophisticated readers the secret

will not appeal so strongly, but the story is full of a fresh-air gospel which makes it wholesome reading for everybody. The cross little girl who finds the key of the secret garden and the invalid boy who shares the mystery of the place are not usual children, but they learn many lessons from the growing things and are interesting playmates; Dickon and his mother are very wise ones. As in Mrs. Burnett's latest play, "The Dawn of a Tomorrow," there is a good deal about the therapeutic power of suggestion, but not to a tiresome degree, and the psychical is so helped by fresh air and sunshine that the new interests are not so heavily burdened as to tax the credulity of the reader. It is a genuinely out-of-doors novel, and suggests a desire speedily to find a garden of one's own, tho the transformation it may work will be less startling.

**The Ne'er-do-Well.** By Rex Beach. New York: Harper and Brothers. $1.25.

Rex Beach is equally at home under the pine and the palm. But except for the climate there is not so much difference as might seem between Alaska and Panama, between digging a mine and digging a canal. The novelty and excitement of the enterprise attracts to the Isthmus the same class of men as a few years ago flocked to the Peninsula, adventurers and ne'er-do-wells among them. There is material for many good stories in the life of this little American community temporarily emplanted in the tropics in the midst of an old Spanish civilization; stories much better than the one in hand, for this is not much more than farcical melodrama, interlarded with perfunctory descriptions of canal construction. Mr. Beach does full justice to the enthusiasm and energy of those engaged in the work, but he goes further than any magazine writer has dared in his charges of corruption and nepotism in the administration; charges which, if unwarranted, as we believe they are, are deserving of censure in a Presidential message.

THE FRONTISPIECE OF REX BEACH'S NEW NOVEL, "THE NE'ER-DO-WELL."

**Mrs. Maxon Protests.** By Anthony Hope. New York: Harper & Brothers. $1.35.

Mrs. Maxon calls it "Inkpat," not liking the long word that lawyers use, and her protest against being "sat upon and squashed all her life" takes some active and unconventional forms in that England which furnishes plenty of incompatibility of temper but no divorce for it. Mr. Hope raises all sorts of questions. He does not answer any of them. His heroine, while a very charming woman, is so evidently constructed for the sole purpose of raising these questions and much mischief besides, that she seems a weak and inconsistent character, Mr. Hope's inconclusive conclusion is this:

> "Man being imperfect, laws must be made. Man being imperfect, laws must be broken or ever new laws will be made. Winnie Maxon had broken a law and asked a question. When thousands do the like, the Giant, after giving the first comers a box on the ear, may at last put his hand to his own and ponderously consider."

The result of which consideration, he obviously implies, will be a law for free divorce; but the story of another butterfly broken on the wheel of the present English law proves nothing, except that this particular butterfly is an especially foolish and futile one. The dialog is written with Mr. Hope's customary cleverness, and the minor characters are well sketched, particularly the husband and wife who maintain a normal home life while harboring the most unconventional opinions and people.

## Fiction Notes

A narrative of garrison life in the West written in a personal and unaffected style by Mrs. Martha Summerhayes appears under the title of *Vanished Arizona* (Salem Press Co., Salem, Mass.; $1.60).

*The Carpet from Bagdad* By Harold MacGrath, Bobbs-Merrill, $1.25. An ingenious romance of adventure with the scene set where East meets West, that is, Cairo. Gorgeous illustrations in color by Castaigne.

....New England and the Western desert are the two scenes of Frances Marian Mitchell's *Joan of Kamboo Springs* (Lothrop, Lee & Shepard Co.; $1.35). A good deal of ground is covered—in more senses than one. There is plenty of sentiment and plenty of adventure in the tale.

....Charles Belmont Davis, in *Tales of the Town* (Duffield; $1.30), very cleverly hits off the life of New York—especially that of the actress, the "bohemian," the flat-dweller and the "clubman." His stories are well told, and convey a genial kind of sentimentality for which we are all of us better off.

....Lady Gregory's *Kiltartan Wonder Book* (Dutton, $1.50) will interest not the child alone but also the lover of folklore. She has not attempted to "arrange" the old tales to any considerable extent, and her book is by that the more authentic. There are crude illustrations by Miss Margaret Gregory.

....*Stories That End Well.* By Octave Thanet. Bobbs-Merrill. The title alone is nowadays enough to sell the book, especially with an author who knows what a good ending is. Whether the entanglement is financial, legal, matrimonial, social or political we all have confidence in Miss French's ability to bring it out all right.

....Nobody has recorded what a cat thinks of a king when she looks at him, but in the story *Four in Family,* by Florida Pope Sumerwell (Bobbs-Merrill Co., $1), we get a dog's-eye view of an average family of whom the dog counts himself the fourth member. The story of "how we look from where the dog sits" is cleverly told and rarely gets out of its doggish character.

....Even one unfamiliar with the Italian novelist's earlier work would learn without surprise that the author of *Leila* was a Senator, also that he was a devout Roman Catholic, moderately "modernist" in his position. That *Leila,* like "The Saint," has been placed on the Index, would, however, probably surprise such an open-minded reader as we are imagining. Yet if M. Faguet is justified in suggesting an analogy between Fogazzaro's work and Luther's, perhaps one ought not to marvel. And certainly the Italian, too, had the reformer's temperament. This last novel of his is undeniably heavy as fiction. It is translated into English by Mary Pritchett Agnelli and published ($1.35) by Hodder & Stoughton.

....The murder of a lady in a wood and the solution of the mystery after suspicion has lain heavily upon her husband, form the theme of *The Vanity Box,* by Alice Stuyvesant (Doubleday, $1.20). The plot is rather cleverly entangled, and the characters more clearly differentiated than in many novels of crime and its retribution.

....A monument to Victor Hugo is to be erected on the battlefield at Waterloo. The great battle occurred in 1815; it was during the summer of 1861 that the novelist established himself on the "mournful plain," to remain two months. Hugo worked harder for his "local color" than some of his successors; perhaps that is why he deserves a granite column surmounted by a Gallic cock.

....The author of "Sowing Seeds in Danny," Nellie L. McClung, has written a sequel to that popular book: *The Second Chance* (Doubleday, Page & Co.; $1.20). It has humor, and the little Irish girl, Pearlie Watson, who lives on the Manitoba farm named "The Second Chance," is a genuinely interesting person, in her anxiety to bring up her seven brothers to be "dacent citizens."

....A wholesome, sunshiny book is *Miss Gibbie Gault* by Kate Langley Bosher (Harpers, $1.20). A little city of Virginia is the scene of a pretty story of two women who tried to help Yorkburg, half against its will, and make it something better than the usual Southern mill town. Miss Gibbie Gault, a spinster of sixty-five, is the unknown benefactor, and an original, sensible, albeit opinionated heroine.

....Jean Richepin has written in *L'Aile* a novel of aviation that justifies, if one may believe the French reviewers, a poet's use of prose. The reader of Richepin is amazed to learn that he

> "has undertaken to study the secret elaboration and sudden explosion of the phenomenon called genius. . . . Genius, in what does it consist? Richepin seeks to explain it. And his demonstration is very penetrating."

So, at least, writes M. Brisson in *Les Annales.*

....Japan is said to be greatly excited over the work of the younger writers who belong to a "realistic" school, with Maupassant and Ibsen for gods, and the fact that these writers have either been placed under arrest or warned by the police that they must mend their literary ideals. Voltaire's proverb, *il faut cultiver son jardin,* might be a good one for these young

cosmopolitans to ponder. No one has got very far by imitating the great "realists," in spite of all their greatness.

....Not, assuredly, just the novel for the French class of the Young Ladies' Seminary, Colette Willy's *La Vagabonde* (Ollendorff, 3 fr. 50) is none the less entertaining for those who are not afraid of attacking a certain proportion of *argot*. The principal character is the ex-wife of a fashionable pastellist, herself a novelist whose first book was the only one to sell, and an apt observer of the music halls and its *coulisses* and a not unappreciative.

"The artists of the café-concert," . . . she writes. "How ill they are known, and described, and how little understood, chimerical, vain, full of an absurd and obsolete faith in Art. They alone, the last of all, dare still to declare, with a sacred fever: 'An *artist* ought not . . . an *artist* cannot accept . . . an *artist* does not consent. . . .

....In "An Imaginative Woman," one of the *Wessex Tales* just brought out in the new compact edition of Thomas Hardy, published by the Harpers ($1.25), Ella Marchill signs her verse "John Ivy," but the poet Robert Trewe, "with a man's unsusceptibility on the question of sex, had never once thought of passing himself off as a woman." The preference of many woman writers for a male pen-name is, doubtless, says the London *Chronicle*, apropos of nothing, a survival of the old superstition that to engage in authorship was "unwomanly." The Brontë sisters set the fashion and appeared as Currer, Acton and Ellis Bell respectively. Their example was followed by George Eliot. But George is a name to which the distressed lady novelist flies as to a city of refuge. We have had George Egerton, George Fleming, George Paston. We have also had John Oliver Hobbes, Ralph Iron, Frank Hamel and Frank Danby. There are only a few cases of men adopting a feminine disguise. Oliver Madox Hueffer has, to be sure, signed his novel Jane Wardle, and William Sharp is better known as Fiona MacLeod. And a French journalist has called himself "Fœmina"—but that is somewhat different.

## New Books of the New Season

It is too early to give a complete list of the books that will be issued by American publishers this fall. After all, it would not be desirable to name even the titles of all the books which will be thrown upon the market, and in the following classified lists we aim at signalizing the most important volumes under the various heads.

Since this is our Fiction number, it is appropriate that we begin with the new fiction. For those inclined to be discouraged because too many novels are read at the expense of more solid literature, let us quote from Mr. John Bigelow's address at the opening of the new Public Library in New York City. When Samuel J. Tilden was planning the foundation of another public library in New York, Mr. Bigelow says:

"He told me that he had just received the annual report of the Boston Public Library, and he found that about 90 per cent. of the books taken from it during the year had been works of fiction. He asked me whether it was really worth his while to devote so much or indeed any money whatever to fostering such an abnormal appetite for imaginative literature. I said to him in substance, that probably the first printed writing that ever made a lodgment in his mind was the melodies of Mother Goose. 'Nonsense,' as Charles Lamb very truly said, 'is children's best sense.' The real luxury of a printed book consists in the degree its contents are capable of interesting us. To create a genuine taste for that luxury, therefore, every one must begin by reading what interests him."

And Mr. Arnold Bennett, in his latest book, *Literary Taste*, tell us that a "classic" survives only "because it is a source of pleasure." This is not orthodox teaching, but it expresses the impressionism of the age we live in. For one who accepts Mr. Bennett's definition, perhaps there will be some "classics" in the following list:

### Fiction.

*Ethan Frome*, by Mrs. Edith Wharton (Scribner, $1). *The Outcry*, by Henry James (Scribner, $1.25). *A Weaver of Dreams*, by Myrtle Reed (Putnam, $1.50). *Mother Carey's Chickens*, by Kate Douglas Wiggin (Houghton, $1.25). *The Following of the Star*, by Florence L. Barclay (Putnam, $1.50). *A Country Lawyer*, by H. A. Shute (Houghton, $1.25). *The Principal Girl*, by J. C. Snaith (Moffat, $1.35). *In the Shadow of Islam*, by Demetra Vaka (Houghton, $1.25). *The Bauble*, by Richard Barry (Moffat, $1.35). *A Safety Match*, by Ian Hay (Houghton, $1.20). *Flower o' the Peach*, by Perceval Gibbon (Century). *Baby Grand*, by John Luther Long (Badger, $1.35). *The Blind Who See*, by Marie Louise van Saanen (Century). *Havoc*, by E. Phillips Oppenheim (Little, $1.25). *The Knight-Errant*, by R. A. Wason (Small, $1.25). *Hilda Lessways*, by Arnold Bennett (Dutton, $1.50). *The Man from the North*, by Arnold Bennett (Doran). *The Heart of Life*, by Pierre de Coulevain (Dutton, $1.25). *The Fruitful Vine*, by Robert Hichens (Stokes, $1.40). *The Song of Renny*, by Maurice Hewlett (Scribner, $1.50). *The Man in the Shadow, and Other Stories*, by Richard Washburn Child (Macmillan, $1.25). *The Wonder Lady*, by Ella Lowery Noseley (Lothrop, Lee & Shepard, $1). *The Inside of the Cup*, by Winston Churchill (Macmillan, $1.50). *A Likely Story*, by De Morgan (Holt, $1.35). *Mothers to Men*, by Zona Gale (Macmillan, $1.50). *The Sick-a-Bed Lady*, by Eleanor Hallowell Abbott (Century, $1.30). *The Healer*, by Robert Herrick (Macmillan, $1.50). *Jean-Christophe in Paris*, by Romain Rolland (Holt, $1.50). *South Sea Tales*, by Jack London (Macmillan, $1.25). *Jancy*, by Inez Haynes Gillmore (Holt, $1.20). *The Jugglers*, by Molly Elliot Seawell (Macmillan, $1.25). *The Garden of Resurrection*, by E.

Temple Thurston (Kennerley, $1.30). *Nonsense Novels*, by Stephen Leacock (Lane, $1). *The Mystery Moon*, by Jeffery Farnol (Dodd). *The Trail of the Axe*, by Ridgwell Cullum (Jacobs, $1.25). *A Person of Some Importance*, by Lloyd Osbourne (Bobbs, $1.25). *Ike and Maurice*, by Montague Glass (Doubleday). *Sixes and Sevens*, by O Henry (Doubleday). *The Adventures of Bobby Orde*, by Stewart Edward White (Doubleday). *Mary Midthorne*, by G B McCutcheon (Dodd). *Margery*, by E. F. Benson (Doubleday, $1.20). *The Last Galley*, by A. Conan Doyle (Doubleday, $1.20). *Corporal Cameron*, by Ralph Connor (Doran). *The Heart of a Woman*, by the Baroness Orczy (Doran). *Joan of the Tower*, by Warwick Deeping.

Biography and Memoirs.

*Recollections, Grave and Gay*, by Mrs. Burton Harrison (Scribner, $2.50). *My Own Story*, by Princess Louisa of Tuscany (Putnam). *Life and Works of Winslow Homer*, by W. H. Downes (Houghton, $6). *Royal Romances of Today*, by Kellogg Durland (Duffield, $2). *Life and Times of Cavour*, by W. R. Thayer (Houghton, $7.50). *Memoirs of Theodore Thomas*, by Rose Fay Thomas (Moffat, $3). *The Life Story of J. Pierpont Morgan*, by Carl Hovey (Sturgis, $2.50). *The Life and Labors of Bishop Hare*, by M. A. De Wolfe Howe (Sturgis; $2.50). *Père Lacomb*, by Catharine Hughes (Moffat; $2.50). *Dr. Johnson and Fanny Burney*, by C. B. Tinker (Moffat, $2). *William Lloyd Garrison*, by Lindsay Swift (Jacobs, $1.25). *U. S. Grant*, by Franklin S. Edmonds (Jacobs, $1.25). *Lincoln, Lover of Mankind*, by Eliot Norton (Moffat, 75 cents). *The Diary of Gideon Wells. With a Memoir*, by John T. Morse, Jr. (Houghton, $10). *The Brownings*, by Lilian Whiting (Little, Brown, $2.50). *Some Aspects of Thackeray*, by Lewis Melville (Little, $2.50). *The Life of Bret Harte*, by H. C. Merwin (Houghton, $4). *Goethe and His Woman Friends*, by Mary C. Crawford (Little, $3). *Maurice Maeterlinck*, by Edward Thomas (Dodd, $1.60). *The Fair Ladies of Hampton Court*, by Clare Jerrold (Little, $4). *Letters of Sarah Orne Jewett* (Houghton, $1.50). *Napoleon*, by Arthur Hassall (Little, $2.50). *Napoleon*, by August Fournier (Holt, $8). *Napoleon and King Murat*, by A. Espitalier (Lane, $4). *The Tragedy of St. Helena*, by Sir Walter Runciman (Stokes, $3.50). *The Wife of General Bonaparte*, by Joseph Turquan (Lane, $4). *Memoirs of the Duc de Lauzun* (Sturgis, $1.50). *An Illustrated History of Lady Emma Hamilton*, by Julia Frankau (Macmillan). *Ruskin*, by E. T. Cook, 2 vols. (Macmillan, $6). *Benjamin Disraeli*, Vol. II, by W. F. Monypenny (Macmillan, $3). *Statesmen of the Old South*, by W. E. Dodd (Macmillan, $1.50). *John Redmond*, by L. G. Redmond-Howard (Lane, $3.50). *The Great Empress Dowager of China*, by Philip W. Sergeant (Dodd, $3.50). *Robert Louis Stevenson in California*, by Catharine D. Osborne (McClurg, $3.50). *Alexander Hamilton*, by W. S. Culbertson (Yale Univ.). *Fifty Years of Public Service*, by Shelby M. Cullom (McClurg, $3). *Life of Andrew Jackson*, by J. S. Bassett (Doubleday, $5).

History and Politics.

*The Cornerstone of Colonial Commerce*, by John A. Stoughton (Little, $1.50). *Memories of Two Wars*, by Frederick Funston (Scribner). *Studies, Military and Diplomatic*, by Charles Francis Adams (Macmillan, $2.25). *Naval Strategy*, by A. T. Mahan (Little, $3.50). *Democratic England*, by Percy Alden (Macmillan). *A Short History of Our Own Times (1885-1911)*, by C. P. Gooch (Holt). *A History of the United States*, by Edward Channing, Vol. III, 1760-1789 (Macmillan, $2.50). *The President's Cabinet*, by H. B. Learned (Yale Univ.). *The New History*, by J. H. Robinson (Macmillan). *German Civilization*, by Ernst Richard (Macmillan). *The Quakers in the American Colonies*, by Rufus M. Jones; assisted by Isaac Sharpless and Amelia M. Gummere (Macmillan). *Commission Government in American Cities*, by Ernest S. Bradford (Macmillan). *Short-Ballot Principles*, by Richard S. Childs (Houghton, $1). *The Annexation of Texas*, by Justin H. Smith (Baker, $3). *The Civilization of China*, by H. A. Giles (Holt). *The Rise of Chinese Nationalism*, by Paul S. Reinsch (Macmillan). *The Women of the Cæsars*, by Guglielmo Ferrero (Century, $2).

Travel.

*Two Years in the Forbidden City*, by the Princess Der Ling (Moffat, $2). *The Changing Chinese*, by E. A. Ross (Century, $2.40). *The Belgians at Home*, by Clive Holland (Little, $3.50). *The Cathedrals of England and Wales*, by T. D. Atkinson (Little, $3). *The Romance of the Oxford Colleges*, by Francis Gribble (Little, $1.75). *Wordsworth and the English Lake Country*, by Eric Robertson (Appleton, $2.25). *The South Wales Coast*, by Ernest Rhys (Stokes, $2.25). *From Constantinople to the Home of Omar Khayyam*, by A. V. W. Jackson (Macmillan, $2.50). *Panama*, by Albert Edwards (Macmillan, $2.50). *Highways and Byways of the Great Lakes*, by Clifton Johnson (Macmillan, $2). *The Danube*, by Walter Jerrold (Stokes, $3.50). *Florence and Her Treasures*, by H. M. Vaughan (Macmillan). *Home Life in Russia*, by A. S. Rappoport (Macmillan, $1.75). *France and the French*, by Charles Dawbarn (Macmillan). *Byways of Paris*, by Georges Cain (Duffield, $2). *In the Land of the Pharaohs*, by Duse Mohamed (Appleton, $3). *Five Years in the Soudan*, by Edward Fothergill (Appleton, $4). *A Search for the Apex of America*, by Annie S. Peck (Dodd, $3.50). *The Wildernesses of the Upper Yukon*, by Charles Sheldon (Scribner, $3). *A Garden of Paris*, by Elizabeth Wallace (McClurg, $1.25). *Spanish Sketches*, by Edward Penfield (Scribner, $2.50).

Poetry and Drama.

*Poems* by Madison Cawein (Macmillan, $1.25). *The Overture and Other Poems*, by Jefferson B. Fletcher (Macmillan, $1.25). *The*

*Wife of Marobius,* by Max Ehrmann (Kennerley, $1). *Youth,* by Charles Hanson Towne (Kennerley, $1). *Mona,* by Brian Hooker (Dodd, $1.25). *The Singing Man,* by Josephine Preston Peabody (Houghton, $1.10). *A Little Book of Home-Spun Verse,* by Margaret Sangster (Sturgis, $1). *Hard Labor, and Other Poems,* by John Carter (Baker, $1). *Embers, and Other One Act Dramas,* by George Middleton (Holt, $1.35). *Sonnets and Ballate of Guido Cavalcanti,* translated by Ezra Pound (Small, $2).

LITERATURE.

*Shakespeare on the Stage,* by William Winter (Moffat, Yard, $3). *Thomas Carlyle: His Literary Apprenticeship,* by W. S. Johnson (Yale Univ.). *Genius and Other Essays,* by E. C. Stedman (Moffat, $1.50). *Democracy and Poetry,* by Francis B. Gummere (Houghton, $1.50). *The American Dramatist,* by Montrose J. Moses (Little, $2.50). *The Early Literary Career of Robert Browning,* by T. R. Lounsbury (Scribner, $1). *Old Lamps for New,* by E. V. Lucas (Macmillan). *The Friendship of Books,* by Temple Scott (Macmillan, $1.75).

MUSIC AND ART.

*Civic Art,* by T. H. Mawson (Scribner, $20). *Nineteenth Century English Ceramic Art,* by J. F. Blacker (Little, $3.50). *Architecture and Environment,* by L. March-Phillips (Holt, $2). *History of Architecture; Volume III,* by A. L. Frothingham, Jr. (Baker, $5). *Temperamental Architecture and Architectural Refinement,* by W. H. Goodyear (Yale). *The Art of the Romans,* by H. B. Walters (Macmillan). *The Story of French Painting,* by Charles H. Coffin (Century, $1.20). *One Hundred Masterpieces,* by John La Farge (Doubleday). *French Architecture of the Sixteenth and Seventeenth Centuries,* by Reginald Blomfield (Macmillan). *The Midsummer of Italian Art,* by Frank Preston Stearns (Badger, $2). *From Morris to Whistler,* by Walter Crane (Macmillan). *Style in Musical Art,* by Sir Hubert Parry (Macmillan). *English Opera and Nationalism,* by Cecil Forsythe (Macmillan). *Famous Operas,* by W. J. Henderson (Dodd, 50 cents each). *Franz Liszt,* by James Huneker (Scribner, $2).

ECONOMICS AND SOCIOLOGY.

*Control of the Market,* by Bruce Wyman (Moffat, Yard, $1). *War and Other Essays,* by William Graham Sumner (Yale Univ.). *Social Forces in American History,* by A. M. Simons (Macmillan). *Principles of Economics,* by F. W. Taussig, 2 vols. (Macmillan, $4). *Wages in the United States,* by Scott Nearing (Macmillan, $1.50). *Social Value,* by B. M. Anderson (Houghton, $1). *Economic Beginnings of the Far West,* by Katherine Coman (Macmillan). *The Tariff in Our Times,* by Ida M. Tarbell (Macmillan). *Pay Day,* by C. Hanford Henderson (Houghton, $1.50). *Increasing Human Efficiency in Business,* by W. D. Scott (Macmillan). *Social Reform and the Constitution,* by J. J. Goodman (Macmillan, $1.50). *Corporations and the State,* by Theodore E. Burton (Appleton, $1.25). *The Immigration Problem,* by J. W. Jenks and W. J. Lauck (Funk, $1.75). *A History of Travel in America,* by Seymour Dunbar (Bobbs-Merrill, $4). *The Port of Hamburg,* by E. J. Clapp (Yale Univ.). *Industrial Depressions,* by G. H. Hull (Stokes, $2.75).

EDUCATION.

*Universities of the World,* by C. F. Thwing (Macmillan, $2.25). *The Career of the Child,* by M. P. E. Groszmann (Badger, $2.50). *Some Fundamental Verities of Education,* by M. P. E. Groszmann (Badger, $1). *Public Education in Germany and in the United States,* by L. R. Klemm (Badger, $1.50). *Education of Catholic Girls,* by Janet Erskine-Stuart (Longmans, $1.25).

SCIENCE AND AGRICULTURE.

*The Gift of Sleep,* by Bolton Hall (Moffat, Yard, $1.25). *The Conquest of Nerves,* by J. W. Courtney (Macmillan, $1.25). *The Farm and Garden Rule Book,* by Liberty H. Bailey (Macmillan, $2). *Farm Management,* by C. W. Pugsley (Sturgis, 75 cents). *A Manual of Farm Animals,* by M. W. Harper (Macmillan, $2). *Plant Life and Evolution,* by D. H. Campbell (Holt, $1.75). *Dairy Cattle and Milk Production,* by C. H. Eckles (Macmillan, $1.50) *Mind of Primitive Man,* by Franz Boas (Macmillan, $1.50). *Biological Aspects of Human Problems,* by C. A. Herter (Macmillan, $1.50). *Storage Batteries,* by Harry W. Morse (Macmillan). *Principles of Human Nutrition,* by W. H. Jordan (Macmillan). *The Riddle of Mars,* by David Todd (Small, $1.50). *The Sun,* by C. G. Abbot (Appleton, $2.50). *A Text Book on Heredity,* by W. E. Castle (Appleton, $1.25). *The Economy of Food,* by J. A. Murray (Appleton).

RELIGION AND PHILOSOPHY.

*Christianizing the Social Order,* by Walter Rauschenbusch (Macmillan, $1.50). *Jesus the Son of God,* by B. W. Bacon (Yale Univ.). *The Credibility of the Gospel,* by Pierre Batiffol (Longmans). *The Moral and Religious Challenge of Our Times,* by Henry Churchill King (Macmillan, $1.50). *Everyman's Religion,* by George Hodges (Macmillan, $1.50). *The Five Great Philosophies of Life,* by William deW. Hyde (Macmillan, $1.50). *Basis of the Scheme of Life,* by Rudolf F. Eucken (Macmillan). *Truth and Reality,* by John E. Boodin (Macmillan). *Other Sheep I Have,* by Theodore Christian (Putnam). *The Religions of the World,* by W. F. Warren (Eaton & Mains). *The Presence,* by J. N. Campbell (Eaton & Mains). *The Problem of Freedom,* by George H. Palmer (Houghton, $1.25). *Egyptian Conceptions of Immortality,* by George A. Reisner (Houghton, $1). *What We May Believe in Life After Death,* by C. E. Jefferson (Houghton, $1). *Life, Death and Immortality,* by W. H. Thomson (Funk, $1.50). *Memories and Studies,* by William James (Longmans). *William James,* by Emile Boutroux (Longmans).

# The Independent

Entered at New York Post Office as Second Class Matter

Publisher, Clarence W. Bowen
130 Fulton Street — New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra. To Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Labor Arbitration on Trial

THE great English strike and its outcome have further discouraged the advocates of arbitration as a substitute for open conflict between capital and labor, and have awakened unhallowed joy in the breasts of those lugubrious philosophers whose comprehensive formula is "I told you so." A definite agreement had been made between English unions and the employers, and it was unhesitatingly ignored and broken. If such things can be, why bother about agreements?

Not only in England, but on the Continent also, the incident has provoked a lot of sober second thinking. *Le Temps,* for example, of August 20, devotes a carefully phrased editorial to "La faillite de l'arbitrage." The English disturbance, it says, has provoked in England and in France "a profound disillusioning" among the partisans of organized arbitration. *Le Temps* does not share the bitter conviction of the syndicalists that the whole arbitration movement has been a fraud, and that Mr. Lloyd-George has lent himself to a mere piece of trickery. It believes that Lloyd-George has shown both sincerity and ability in his efforts, but that the arbitration idea is inherently defective.

There is weight in the reasons which *Le Temps* advances. Almost a generation ago, when arbitration was seriously discussed in the United States, an extensive pamphlet and monographic literature on the subject appeared, and more than one State bureau of labor statistics devoted special reports to it. The conclusion from theory and experience at that time was, that conciliation, including all efforts to prevent conflict and bring about an understanding, may be expected to prove successful in a high percentage of cases, but that actual arbitration of points in dispute, in the understanding that both parties to the quarrel will be bound by the decision of the arbitrators, has usually failed, and holds out little promise of success in the future. *Le Temps,* without referring to this chapter in American labor history, arrives at the same conclusion from its survey of European conditions, and from the experience of New Zealand, Australia and Canada.

As prevention is always better than cure, conciliation, in the nature of things, is more promising than arbitration; and it is true, as *Le Temps* argues, that in labor difficulties third parties cannot possibly know as well as the immediate parties to the conflict what the relative gains and losses of fighting, on the one hand, or surrendering, on the other hand, will amount to. So long as this remains true, there is always a presumption that when conciliation fails a subsequent arbitration will offer but doubtful hope. And it must be admitted that arbitration thus far has not scored much success in those countries where it has been tried on the largest scale and with all the resources of government authority back of it.

We must go back, *Le Temps* believes, to a régime of liberty of discussion and decision. If the meaning is that any hope lies in a return to unrestricted competition, the prescription of the social doctors of *Le Temps'* staff is surely as worthless and probably as innocuous as that of the extremist school of government paternalism. Liberty within limits in these matters is absolutely necessary, and in a large majority of instances it is

justified by its consequences. But it is precisely in those cases in which liberty fails that we need other recourse, and the troublesome question is—what?

We strongly suspect that it is a mistake to try to mix liberty and authority in the same pill. What the world will have to come to, as the case looks now, is a plan whereby organized employers and labor unions will be permitted freely to bargain and agree if they can, but providing for governmental interference and arbitrary decision, from which no appeal will stand, and backed up by effective penalties, if conflict is continued with public loss and inconvenience, beyond a certain time limit.

All parties affected by the labor bargain, employers, workingmen and the public, want a plan that is either fish, flesh or fowl. Arbitration proves in experience to be nondescript. Far better would be a plan that could be depended on to work, even if now and then it worked unfairly to one side or the other. Let the presumption of liberty stand. Let the parties agree in liberty if they can. When they can't, let the State step in, and without any beating about the bush tell them, not what they ought to do, but what they must and will be compelled to do. This plan would have the further advantage that it is suitable for any scheme of social organization. It is called for by the present social order. It would be absolutely necessary under socialism.

## Marriage and the State

In certain late discussions of the relation of marriage to the Church complaint has been made that the Church assumes too much authority over marriage, and the desire has been exprest by those who would be "liberal" and "free" to break away from the tyranny of the Church in their marital relations. This is a hasty and unintelligent desire and effort.

What has the Church to do—historically with marriage? Very little. It did not create marriage; it accepted it. Marriage is a creation of society, of very primitive and rude society, and it was developed and its laws established long before the Church existed. Marriage laws rest on the needs of human beings and the experience of the race and the wish and consent of men and women. Usually there has been, and now usually there is nothing religious about its celebration. A man and a woman take each other by the consent of their parents, and with a feast perhaps, and a procession and a transfer of gifts; that is all. Taking each other makes them husband and wife, and its rights and privileges follow of this

> "sole propriety
> In Paradise of all things common else."

But marriage involves duties, obligations; among them sole personal right of possession, "propriety"; and duties are hallowed and enforced by religion; and the Church supports and maintains all religious duties, including those of marriage. Accordingly it is proper that the Church should give its weighty sanction to whatever marriage rights, duties or authority society may have established. The Church will accordingly supply ceremonies for marriage and solemnize the marriage when desired, and, if society by its laws allows, will pronounce a marriage valid. But this it does not by its primary authority but by the consent and under the direction of the State.

To seek to get out from under the rule of the Church in marriage, and thus to find a larger liberty or license, is futile, for marriage laws and sanctions are not made by the Church but by the State. Society makes them; the public makes them. If a loose man wants to cut loose from the wife to whom he was bound by the State he must ask the State's permission. The State in this country, as in all civilized countries, tells him he must live chastely with his wife; and while the Church supports the State in this requirement, the Church can do nothing more than say its say on the subject; anything more, anything final, must come from the State which created the marital contract. It is the State that must say whether there can be separation, and what degree of separation, and what provision for the support of a divorced wife, and which shall have the care of the children. With all this the Church has nothing to do. It can only say its mind.

And the State does not like sexual

license. It believes in domestic bonds. That is, it has learned that the way a lion lives with a lioness is better than the way of buffaloes or dogs. That is the settled conclusion of civilized humanity, and thereto the Church agrees; and woe to the man or woman who goes athwart what ten thousand years of moral growth, thru various social stages and experiments, has decided to be best, and therefore to be right and obligatory. If any man is a rebel against this decision of society in favor of permanent monogamous marriage, he will find the world against him, if not the flesh and the devil. Against the world and its social laws and erent inclinations normally manifested in not against the Church.

## The Hero as Fly-Killer

ONCE upon a time a young man could acquire a reputation as a public benefactor by simply taking a trip into an unknown land and reporting on his return that he had killed a dragon, a giant or a magician. Nowadays this easy avenue to fame is closed, for now we know who are the real enemies of the human race and consequently we know who are our real rescuers. There is a monstrous being with more eyes than Argus, wings like a monoplane, six long hairy legs and a mouth armed with horrid mandibles, sucking blood and dripping with poison. Like the jinns of old this creature has the power of multiplying itself rapidly, assuming various shapes and reducing its size until it becomes almost invisible. In one form or another it forces entrance into every home in the land and daily slays its thousands.

The Brave Little Tailor of the "Blue Fairy Book," when he emblazoned his girdle with the boast, "Seven at a blow," was obliged to conceal the nature of the adversaries that he had conquered at one fell swoop, and it was not until he had slain the giants and captured the unicorn and the boar that he received the reward to which his first exploit entitled him. That was because he was in advance of his times. If he had lived in this enlightened land and age he could have found vent for his enterprise in a fly-swatting contest. The championship of America in this field of beneficent belligerency is now held by George Knaeble, of Milwaukee, aged thirteen, who gained the first prize of $50 by the slaughter of 266,340 flies. He was closely pushed in the competition by Theodore Bedor with a record of 264,660.

Now a fly lays 100 to 150 eggs and a generation is completed in a week or ten days. If the reader will multiply 3,208,575, the number of casualties in this fly crusade, by a hundred some thirty-six times, to use the lowest figures, he will by adding them up discover the extent of the world's indebtedness to the Milwaukee boys. This is for one year only. Continue the process for a few years and you will find that, if nothing happened to prevent, the progeny of the deceased Milwaukee diptera would have filled the whole globe to the level of the mountain tops and extinguished all other forms of life. This conclusion is arrived at by the same mathematical methods commonly used to calculate the increase in the Socialist vote, the growth of Rockefeller's fortune, and the spread of Esperanto.

But without venturing into such hypothetical futurity it is certain that if this warfare is kept up and supported by systematic suppression of breeding places it will make a great difference in the spread of typhoid and other diseases whose germs are carried on borrowed wings. Here, too, is an opportunity for the legitimate exercise of those belligerent inclinations normally manifested in youth and difficult to suppress. It was Bulwer-Lytton who proposed in his "Coming Age" to utilize the destructive instincts of adolescence by arming the young people with the fatal fluid he called "vril" (doubtless the radium emanation) and sending them forth to kill such dangerous animals as still survived in that utopian epoch.

But we must remember that the hero of olden times was always rewarded, not merely by half of the kingdom but also by the hand of the beautiful princess. A pecuniary reward alone will never bring out the highest heroism. It must be supplemented by feminine appreciation. The Apache lover had to show his string of scalps, the Borneo belle demanded a pickled head before the marriage could be celebrated. One of the hindrances to

the progress of civilization has been that women have always been somewhat belated in their ideals of manhood and so have perpetuated antiquated forms of heroism that should have gone to the scrap heap. Even in this so-called twentieth century the ladies often seem to be more fond of a general in the army than the president of a peace society. A football champion is more popular with the coeds than the student who has successfully tackled a Greek verb or broken thru a line of Virgil. So we fear it will be a long time before the American maiden tells her suitor, "Bring me a million dead flies and I am yours." Such a transvaluation must come slowly.

## Mr. Margoliouth's Dream

In our issue of December 15, 1910, we made known to our readers the announcement by Mr. Margoliouth, an able scholar of the British Museum, that the so-called "Zadokite Document," discovered by Dr. Schechter, of the Jewish Theological Seminary in this city, made definite reference to John the Baptist, Jesus and Paul, and was thus a most important source of Christian history, coming to us from the first century of our era, from which we have scarce anything but the New Testament. He told us that it was the product of Jewish Christians who held fast to the Jewish rites, and who rejected bitterly the wider views of Paul. As soon as we could get access to the original text of this document we warned our readers to be slow to accept this interpretation, so different from that given by Dr. Schechter. Since then this old Hebrew document, evidently the work of a leader of a sect whether of Judaism or Christianity, has received minute study by various scholars, and to three of these we would now direct attention, as they are the latest, and as they agree on the most interesting question raised by Mr. Margoliouth. The three papers to which we refer appeared at the same date in the numbers last issued of three of the leading theological quarterlies of this country, by Dr. Kaufmann Kohler, in the *American Journal of Theology*, of the University of Chicago, by Prof. George F. Moore, in the *Harvard Theological Review*, and by Dr. William Hayes Ward, in the *Bibliotheca Sacra*.

Dr. Kohler, who is a professor in the Hebrew Union College of Cincinnati, is without any American superior in his knowledge of Jewish history and literature. His conclusion is that this newly discovered document represents a Samaritan sect founded by Dositheus in the first century before our era. History tells us something of the Dositheans, but does not give us a date for Dositheus, whose name is a Greek rendering of Jonathan or Nathaniel. Dr. Kohler differs in this from Dr. Schechter, who had made this a Jewish sect of a Sadducean origin, as the name of Zadok, which appears twice, seemed to suggest. He dates it just about the time of the capture of Jerusalem by Pompey, before the middle of the first century B. C., at a time when the Samaritans were for a brief period delivered from the rule of the Jews at Jerusalem. Dositheus would then be the Messiah, or "Only Teacher," honored in the document, which is a manifesto addrest to his followers. The question which immediately arises as to this assignment is, How can it then be explained that the colony is said to have gone to Damascus from Judah—"the priests are the captivity of Israel who went out from the land of Judah"? Again, we read of "those who have gone forth from the land of Judah and sojourned in the land of Damascus." These are not easily Samaritans. The honor given to all portions of the Old Testament was not to be expected of Samaritans who retained only the Books of Moses. But the important thing for our purpose now is the date assigned.

Professor Moore holds the chair of Comparative Religion in Harvard University, formerly of Hebrew in Andover, and stands with the very best of American Semitic scholars. The purpose of his article on "The Covenanters of Damascus" is to give a general view of their teaching. He differs from both Dr. Schechter and Dr. Kohler in putting the date of the migration of the sect to Damascus and the writing of their manifesto at the middle of the second century B. C., or near the time of the disasters under Antiochus Epiphanes. Professor Moore regards these Damascus cove-

hunters as a special sect of whom we had no previous knowledge, whose peculiarity was their extreme strictness. In the mention twice of Zadok he sees no reason to call this a Zadokite sect as does Dr. Schechter. Because he puts the date of this sect in the second century B. C. he cannot accept it as Dositheau, as Dositheus was a century later. Mr. Margoliouth's assertion that this is a Jewish-Christian sect he treats with no gentleness. That Jesus should be made as "the Only Teacher," the support for these extremely strict sabbatical laws, he regards as impossible, and "Mr. Margoliouth's identifications rest upon a palpable misinterpretation." They were an anti-Pharisaic sect, having affinity with the Samaritans, the Sadducees, and in later times the Karaites, but not to be identified with any one of them. The notable point in Professor Moore's discussion is the ease with which, depending mainly on the very doubtful chronology of the work, he puts the date a hundred years earlier than do other scholars, notwithstanding the quotations from the Book of the Jubilees and the Testaments of the Twelve Patriarchs, usually assigned to a subsequent date.

Dr. Ward, in his paper, confines himself mainly to discussion of Mr. Margoliouth's Christian hypothesis. He agrees with Dr. Kohler and Professor Moore that this is not a "Zadokite" sect, and he finds no evidence that it was a sect specially hostile to the Pharisees. That they had nearer relations to the Pharisees than to the Sadducees appears in their belief in the future life, in angels and devils, and in predestination, while their ritual strictness also allows this conclusion. Inasmuch as they had abandoned the temple in Jerusalem and were hostile to its reigning dynasty, it seems likely that the date would be soon after the persecution of the Pharisees by the Sadducean Alexander Jannæus, or shortly before the middle of the first century B. C.

Mr. Margoliouth's startling announcement is then not substantiated by any one of these three American scholars who have given attention to it, any more than it was by Dr. Schechter, nor has any European scholar accepted it. We may dismiss it as untenable, however welcome it would have been to find a new Christian document of the first century of our era, and particularly one as old as the Epistles of Paul, and yet representing those who were his bitter foes. It was a seductive theory, supported by such terms as "the New Covenant" and such provisions as that for the collection of alms for the poor, but it must be dismissed to that "limbo large and broad" "on the back-side of the world," where are stored "all things transitory and vain" that fill the works of men and await their "final dissolution."

## Diets—Simple and Mixed

During the hot weather a good many people doubtless came to the conclusion that they were eating too much and to consider that they must make rules for their diet and especially for the limitation of meat in it. So much has been said about the harmfulness of meat in hot weather and its tendency to create uncomfortable feelings, that there are a good many who have at least fleeting intentions during the summertime of giving it up. If in addition they have had emphasized for them the fact that vegetables contain all the necessary food elements and are less objectionable in many ways from considerations of cleanliness and the absence of risks of infection by various parasites as well as more economical, they are likely to take the matter up seriously. Vegetarians urge that plants contain all the carbohydrates that man needs, fats just as valuable as those that can be obtained from animal products and if possible even purer in composition and that the legumes particularly contain protein in even more concentrated form than lean meat. All this would seem to indicate that the sooner mankind became converted to the exclusive use of vegetables the better, and above all, that this is surely the best diet for the summertime.

Probably nothing has proved more fallacious, however, in questions of human dietary than the arguments from chemical composition. Away back in the nineteenth century, when Liebig discovered gelatine, it looked as tho that ought to constitute an ideal ingredient of human diet. It contains all the chemical

elements that are most commonly needed in the human body, and it would seem as if all that were necessary would be to take a sufficient quantity of this with water and perhaps a few salts and extractive substances and the human machine could be run very well. For a time it was exploited as an ideal concentrated food and it was expected that soldiers would carry it with them on forced marches and be able to support themselves by little cubes of this extremely nutritious material containing practically no waste. Experience soon showed, however, that while gelatine contained all the chemical elements, these were in such a form as to be practically useless in the human body. Gelatine goes almost unchanged thru the human system. So little of it is absorbed as to make it quite worthless as a food material, tho it remains an excellent diluent for sweet and flavored substances and satisfies craving for the moment without necessarily adding anything to weight. It is an ideal dessert for stout people who do not want to get any stouter.

Something of this same thing happened with regard to many other substances supposed after chemical analysis to be eminently suitable as articles of diet. Some years ago, for instance, it was found that mushrooms contain a large amount for their weight of nitrogenous material, and it was thought that these would replace meat to a great extent, especially in warm weather and in tropical countries. Physiological experience, however, showed that the nitrogen content of mushrooms was available for human beings only to a very small degree. The flavor of the fungi is pleasant to many; dressed with butter or with cream, they become nutritious by the additions that are made to them, but in themselves they are valuable almost entirely as tasty additions to diet which leave a considerable residue. This, by providing something for the bowels to move on, encourages peristalsis, prevents to some degree constipation and thus takes on a value quite apart from nutrition.

This question of the digestion and absorption of nitrogenous materials, the proteins as they are termed, is extremely interesting and has attracted considerable scientific attention of late years. Some recent experiments have demonstrated that if rats and mice are fed exclusively on the protein derived from maize they die of protein starvation. They like the substance and eat it with avidity, but are unable to make use of it properly for nutrition. If they are given a very small quantity of certain other substances in addition to it, notably one called tritophan, they are able at once to utilize the maize protein products and cease to be starved. The body proteins of mice, and of this animal group generally, has tritophan for a constituent. If the mice cannot obtain this the process of the formation of protein does not proceed properly in them.

This is one of the mysteries of nutrition that have many analogs in other animals and in human beings. For instance when animals eat fats they are not absorbed directly into the system and deposited as they are consumed, but in each case the fat is changed into a particular variety peculiar to the animal in question. The various fats contain varying proportions of olein, palmitin, and stearin. Except under pathological conditions only the special fat is deposited. Unless the materials for that are supplied there would be fat-starvation in spite of the consumption of large quantities of fats. The use of one kind of fat then might well be dangerous, tho our observations so far have not absolutely demonstrated that. What we learn, however, is that not fat and protein and carbohydrate in general, but special kinds of these are needed. To use a single form is dangerous lest it should not contain all the elements needed.

The whole trend of recent chemical development in its relation to human dietetics is toward the mixt diet as the safest. It is true that there are certain people who seem to be able to live very well and do their work, sometimes even very strenuous work, without anything but a vegetable diet. There are definitely other human beings for whom this does not seem to be possible. We must not forget that just as there are differences between the species of animals in this regard, so there seem also to be differences between various individuals. A

horse fed on straw will starve, because he uses so much digestive energy in the preparation of the straw for nutrition purposes that he uses up more energy than he obtains from the straw no matter how great a quantity he eats. He will live for a good while on it, but will eventually succumb. Sometimes there is the feeling that he is getting used to it, but it proves fallacious after a time.

The fact of the matter seems to be that man's liking for meats is due to their saving him some of the energy necessary for digestion if plant instead of animal food were used. As A. D. Hall, the director of The Rothamsted Experimental Station, in "Some Aspects of Vegetarianism" in *Harper's* for July, said, "When maintenance is also allowed for, the net result of feeding can never show a good conversion of vegetable food into animal food." He says further: "Something like twenty pounds of vegetable food in its normal condition has to be consumed for every pound of meat that is produced." Vegetable food is more economical, but it is not economy but efficiency that most people are seeking. The less enterprising races can live well on vegetables, but those with initiative and strenuous endeavor in them find meat a great saving of energy.

Wherever it is possible men live on a mixed diet. It seems to be their nature to do so. There is always some reason that compels them to a vegetable diet. This would seem to represent the instinct of the race, and instinct, we are coming more and more to recognize, is the most precious guide in diet. It beats our chemical knowledge in its present stage "all hollow." We used to talk about the harmfulness of sugars and sweets, and now we ship tons of candy to the soldiers in the Philippines, and the German army has a package of chocolate and loaf sugar as an emergency ration on forced marches during maneuvers. We used to declaim against iced drinks, but they are now given very commonly by physicians. We used to talk much of the indigestible things that people eat, but most of the so-called indigestibles leave a precious residue with which is carried out much offensive material properly diluted so as not to be harmful. The instincts of the race for a mixed diet are the most precious guides we have, and while, of course, in artificial conditions they are liable to abuse, from the abuse of a thing no argument lies against its use and the better a thing is the more liable it is to abuse.

## Apples

It is good news for the American people when we can chronicle at the beginning of the harvest that the apple crop is pretty good. That is probably the best that can be said of it, for while bigger than that of 1910, it is by no means a universal success. Some of the apple States report, like Maine, 90 per cent., and California, 80 per cent. of a full crop; but the best from Arkansas is 24 per cent.; Missouri, 30 per cent.; Massachusetts, 37 per cent.; Michigan, 38 per cent.; Ohio, 46 per cent.; while West Virginia gets up to 50 per cent.; Iowa, 60 per cent.; Idaho, 62 per cent.; Colorado, 67 per cent.; but Indiana drops down to 15 per cent. and Oregon reports 41 per cent. The outlook is for a crop large enough to give the boys and girls of the United States a fairly good winter supply. The point now is not to let the speculators deceive the farmers, buy up the stock, and put it away in cold storage till next spring. The price for the farmer in the orchard ought to be a good one, when the fruit is well selected. It happens, however, that not one single crop generally grown in our country is so meanly cultivated, so ignorantly handled, and so deceitfully sorted as the apple. It is nearly impossible, in open market, to find barrels that have not been laid at the head and stuffed in the middle. If there is any one place where we need to have a new social piety touch it is the apple barrel. Give us the best apples, thoroly sorted and carefully handled, so that they will keep all winter, and it will add 20 per cent. to the health of the young folk, and the old folk as well. Cheap oranges are well enough, if they are ripe when picked; but there is not a fruit that can reasonably displace the apple, for its delicious eating qualities and its effect on digestion. One year ago thousands of barrels of apples were bought all thru the apple belt for $1.50 a barrel and

immediately sold for $6. The farmers should be more wideawake on the market question. Our Agricultural Department should give out the exact facts as to the crop ahead by the middle of August, and the growers should put themselves in connection with the Department, and so save themselves from fraudulent statements.

Talking about apples, which is a spicy topic at this time of the year, one of the best authorities on the subject tells us that there are not apples enough grown, even in bumper years, to meet the increasing export demand and then go around among the boys and girls of the United States. Every country homeowner should plant this fall at least ten apple trees, and then he should consider them as special pets, taking care of his trees on scientific principles; that is, he should feed them well, trim them well, spray them thoroly, thin his fruit wisely, pick it carefully and barrel it honestly. Living in the apple belt of the States our population must be about fifty-five millions, for this belt reaches all the way from Canada down into the Gulf States. We should like to see an enthusiasm awakened that would plant an apple tree for every unit of these millions. Nothing will pay better or pay faster, if the orchard or even the single tree is dealt fairly by. Each tree at eight years of age should yield $10 worth of fruit annually. At twelve years of age the same tree, if not smashed with ladders, or allowed to run to suckers, will bring the family double that amount of fruit. Orchards are plentiful which yield eight barrels of well-graded fruit to the tree, worth between $30 and $40 in any good market. Here is the easiest, the noblest and the most wholesome of all crops, a specially Yankee fruit, for nowhere else in the world does the apple thrive as it does in America. Let us have an apple craze.

**Dodging the Publicity Law**

When the Democratic House of Representatives past a stiff bill to make public all campaign contributions of candidates for Congress, there was some surprise that the Republican Senate stiffened it considerably more. But now it seems that there is a "joker" in the law as finally past, after conference with the House, in the omission of provision for making the reports public records as applied to Senators. It does require this as applied to Representatives. And the Senators are quite as likely to expend extravagant sums of money for election as are the members of the lower House, as several cases have lately shown. As it now is, the press has been refused access to the expense accounts of the two Virginia Senators. The people ought not to, and will not, stand such blocking of their will in this matter. The needed amendment should not be forgotten when Congress meets in its regular session. What we would like to see is the English law enacted here, which declares an election void when the proper court decides that the Corruptions Act has been violated. That works admirably and nearly cures the evil, and it is strictly applied and enforced.

**Murder by a Kansas Mob**

No one will be convicted or even indicted for the murder of J. J. Frisbie by a mob at Norton, Kan., last Friday. He was a professional aviator, giving exhibitions, this time at a county fair, and a very reliable one he was. His engine was working badly and he knew it was dangerous to make the attempt at flight, for he had just escaped from a fall of forty feet. When he announced that he could not safely try his machine the crowd—we may as well call it a mob—jeered at him, called him a faker and insisted on his giving them their amusement, refusing all explanations. At last he yielded, not willing that the people should insist that he was not doing his best. At the hight of a hundred feet the engine failed to work, and he fell under it and was crushed to death before the eyes of his wife and two children. The mob had not directly laid hands on him to kill him, as did another mob in Coatesville, Pa., and yet another mob in Oklahoma, and dozens of others that might be mentioned; but biting and burning words may be as murderous and effective on a sensitive nature as the pistol or the torch. While guilty of no punishable statutory crime, those who took part in this murder by refusing to listen to good reason and by insisting on self-destruction will carry the punishment of bitter memories

of their act as long as they live. But they can make no reparation to the widow and orphans.

**Texas Prohibition**

Since our reference in THE INDEPENDENT of August 24 to the negro vote in the Texas prohibition election, we have received some additional and very interesting information. When the State-wide prohibition rally was held at Fort Worth last spring, one of the speakers, in concluding his address, called upon Dr. Williams, president of the Negro Baptist Convention of Texas, to say something in the interest of the temperance cause. Immediately a concerted movement by white men on the platform who were leaders in the convention vetoed this invitation, and Dr. Williams was not allowed to speak. In order to prevent his appearance before the body a motion was made that Dr. Rice Maxey, of Sherman, address the meeting, and this motion, tho not without protest from several delegates, prevailed. We are advised that no effort whatsoever was made by the leaders of the prohibition forces in Texas to influence the negro vote for prohibition. The idea which seemed prevalent in the Fort Worth convention permeated the entire prohibition State organization, with the result that the cultivation of the negro vote was left entirely to the anti-prohibition forces. Those who are thoroly informed upon the subject and who were in touch with the Texas prohibition election, advise us that the prohibitionists could and would have carried the State if it had not been for the short-sighted policy adopted by the amendment forces with regard to the negro vote. As the matter stands, no one absolutely knows what percentage of the negroes voted against prohibition, but there is no doubt of the fact that every effort was made by the saloon interests to capture the negro vote, with no counter effort whatsoever on the part of the leaders of the prohibition campaign.

**The Canadian Campaign**

Our Lady of the Snows is getting warmer as the summer passes. A hotter campaign was never waged across our northern border. It began with commercial arguments of profit or loss over reciprocity, and it has passed into a bitter attack by the Conservatives against the supposed purpose of Laurier and the Liberals to favor ultimate annexation to the United States. Reciprocity means, they say, lowering of the tariff wall, and that means easier trade with this country, and that will lead to annexation, and where then is loyalty to Great Britain? Yet, strange to say, in Quebec the French speakers under Mr. Bourassa, such as the Hon. Jean Prevoost, are stirring their hearers to frenzy by actually waving the French tricolor, denouncing Laurier, the navy and the British connection, and complaining that twenty millions go annually to British investors. Such is the inconsistency of the opponents of reciprocity. They are afraid of trade relations with the United States, and yet at present Canadians trade every day to the amount of a million dollars with this country. Men applaud speakers who picture the danger of Canada's being swallowed by the American trust octopuses, who are themselves agents of these trusts. *The Toronto Globe* gives startling illustrations. Mr. Borden is the Conservative leader who is boosting loyalty, on the ground that reciprocity means the conquest of Canada by the trusts, and that this business annexation will be followed by political annexation. He talked nothing else at his late address in Toronto. Two very prominent citizens of Toronto who sat on the platform and warmly applauded were W. K. George and W. K. McNaught. Mr. George is president of the Standard Silver Company with a factory in Toronto. Was he so afraid that Canadian financial independence would be endangered? Of the 300 shares in his company he owns only one, and 295 are owned by a trust company in New York. He is the agent of an American trust. Mr. McNaught is president of the American Watch Case Company, whose factory is also in Toronto, which has a capital of $500,000. Of that amount he owns just one $100 share, and one other lone $100 share is owned in Canada, and all the rest by the Waltham and Elgin watch companies and their agents in this country. And he fears American trust control of Canadian business! What they really fear is that reciprocity's lowering of the tariff on certain objects will

be followed by other reductions not to their profit. The opposition to reciprocity is selfish and dishonest.

If there is anything new under the sun in the argument of design for the existence of God we shall be glad to have it given to us; but it is surprising to be told that such an argument was presented last week by Professor MacDonald to the British Association, which is not much given to discussions of theology. It is difficult to make out the full force of the argument from the very inadequate cable despatch; but so far as is made clear one point was that the human eye, a most exquisite mechanical contrivance, requires an external agent of supreme wisdom to devise it, for as it is formed before birth it could not have originated as a reaction from the effect of light. The total argument, of which this is but a suggestion, is said to have been very impressive, but we will wait and see how much it means.

Senator La Follette exprest the right view as to the honor of the Presidency in his address last week to the Grangers of Pennsylvania. He said that any one would like to be President, but that the honor of doing fundamental work for the benefit of the people was greater than the highest office in the gift of the people:

"I would rather have that and the place it will give me in history and what there will be as a legacy to my children than to have the place that some men who have been President will have in the history of this Republic."

The names of three American statesmen who were contemporaries, Webster, Clay and Calhoun, are far better known to fame than several Presidents whose very names are almost forgotten.

Postmaster-General Hitchcock believes in developing the postal service, but doing it gradually as it can be made to pay. So he has begun with postal banks, gradually increasing their number; and so he would have Congress provide to do with the parcels post. He would first put it on all rural free delivery mail routes, where the initial expense would be very small as the agents could easily carry the packages in the wagons which they now use. At first the carriers would carry parcels only from and to the central point from which they start, and it is hoped that this would be immediately profitable. Mr. Hitchcock has put the department for the first time very nearly on a paying basis, and we hope that Congress will approve the plan.

Quite correctly, from its point of view, *America* rebukes Katharine Tynan for "an unorthodox conceit" in a poem in *McClure's:*

"'Child if I were in heaven and you were in hell . . .
I would leave the fields of God and Queen Mary's feet,
Straight to the heart of hell would go seeking my sweet.'

"Now, if Katharine Tynan knew or cared to remember her catechism she would know that if she were in heaven, and therefore enjoying complete happiness, she would never want to get out of it; also that if she did get to 'the heart of hell' there she would stay with her 'sweet,' and there would be nothing sweet in that."

All that is true, according to her catechism, but her heart might be allowed to forget it. Possibly heaven and hell are not places, but states, and she might do what our Lord did when he preached to "the spirits in prison."

The partial destruction by dynamite of a new railroad bridge last Sunday at Mount Vernon, near this city, is the twentieth affair of the kind in the last few months, all directed against such structures built by non-union labor. While the McNamaras are charged with one such crime we have no evidence that union men or their officers are guilty of these crimes, further than the fact that it is non-union work that suffers. It is the law of chances that raises suspicion to approximate certainty.

The return of the over-paid Chinese indemnity is paying well for both China and the United States. From its income the Chinese Government has sent sixty-nine boys and three girls to be educated in American institutions. Let it be understood wherever they go that they belong to the best families and are picked candidates, and should be received with all cordiality, as in fact they are by their college mates.

# Insurance

## Cost of British National Insurance

It is reported that various corporations from which contributions would be required under the operation of the Lloyd-George national insurance scheme in Great Britain are figuring the cost to them of the application of that plan for insurance under Governmental auspices. It is estimated in London that the railroads of the United Kingdom under the operation of the national insurance scheme would be called upon to pay annually a sum roughly put at $2,500,000. Some of the larger railways, individually, would have to contribute to the fund as much as $300,000. Large as this amount is in itself, it represents but a small percentage of the gross receipts of the British railways, which amount to about $620,000,000 annually. The contribution which would have to be made to the national insurance fund would amount, therefore, to about two-fifths of 1 per cent. of the gross receipts of those railways. This does not seem a very large amount when compared with the expenditures made in one form or another by the American railroads for the improvement of the condition of their employees.

THE Travelers Insurance Company of Hartford has compiled a table showing the causes of accidents on which claims were paid by the company last year. The table is in the form of a percentage, without regard to employment. The high percentage of accidents while at home and walking is most noticeable. It would appear twenty-five times more dangerous to stay at home than to take a steamship journey. The table is as follows:

| | |
|---|---|
| At home | 25.9 |
| Pedestrians | 18.2 |
| Automobiles | 11.1 |
| Recreation | 11.0 |
| Horses and vehicles | 9.9 |
| Street car travel | 7.2 |
| Railway travel | 4.3 |
| Bicycles | 1.2 |
| Steamship travel | 1.0 |
| Miscellaneous | 10.2 |

WHEN you have once made up your mind and taken out a life insurance policy you are not likely to regret it.

THE report of the committee of the Insurance Commissioners' Convention on industrial health and accidents settlements concludes with twenty-four recommendations, of which the most important are:

That a standard industrial health and accident policy provision law be enacted; that prorating for changes of occupation should be permitted only when the insured has actually changed his occupation; that the policy fee be abolished; that all industrial agents and collectors be licensed by the State; that frequent examinations covering not only financial conditions but also treatment of policyholders be conducted either by the individual States or by a committee of the convention, and that publicity be given to the results of all such examinations.

PROOF that the Mutual Life Insurance Company of New York is making steady, permanent gains in the way of production is shown by the fact that the new paid-for business for the first seven months of 1911 is $11,000,000 ahead of the same period of 1910. Provided the present rate of production is maintained, the new paid-for business for 1911 will reach $145,000,000.

THE slowness of the negotiations of France and Germany over Morocco leads to the taking out of further insurance with the Lloyds.. The rate against war between France and Germany in 1912 has risen to 15 guineas per cent. The rate against war between Great Britain and Germany has gone to 8 guineas per cent.

THE day after the death of William Porter, a New York banker, the Ætna Life Insurance Company paid claims on accident policies which he held amounting to $57,500, and $1,107 for surgical operation and disability indemnity, a total of $58,607. Mr. Porter was injured in an automobile accident.

# The Independent

VOL. LXXI NEW YORK, THURSDAY, SEPTEMBER 14, 1911 No. 3276

## Survey of the World

**Justice Hughes a Candidate?**

According to the New York *Herald*, the "progressive" wing of the Republican party, which has opened political headquarters in Washington to oppose the renomination of President Taft, will work to bring about the nomination of Charles Evans Hughes, formerly Governor of New York and now Justice of the Supreme Court of the United States, as the Republican candidate for the Presidency. It is said that Senator La Follette will withdraw from the contest and support Justice Hughes in the national convention. W. L. Howser, a former Secretary of State for Wisconsin, and now in charge of the campaign to prevent the renomination of President Taft, is said to be confident that the "progressive" candidate will receive in the convention the solid delegations of California, Idaho, Indiana, Iowa, Kansas, Michigan, Minnesota, Nebraska, New Hampshire, North Dakota, Oregon, South Dakota, Washington and Wisconsin. Opposition to President Taft is said to be strong thruout the Republican organizations of the Southern States because of the large number of Democrats whom he has appointed to office. Plans have been made to have Senator La Follette and other "insurgent" leaders follow in the trail of President Taft when he makes his swing around the country within the next few weeks. Senator La Follette will endeavor to speak at every place where President Taft appears, and it is stated that opposition to President Taft is taking definite form in all the Western States.——Senator Cummins, in his concise "bill of particulars" against Mr. Taft, being a general statement of his reasons for opposing the President's renomination attacks his position on the tariff, the enlargement of the powers of the Interstate Commerce Commission, postal savings, the income tax and corporation tax, and conservation. "With respect to the Canadian tariff bill," says Senator Cummins, "there is, of course, the widest difference of opinion." Continuing:

"Reciprocity is a progressive term; but I think it is true that most of the progressives have been unable to find in the Canadian bill the essential elements of reciprocity. I do not desire to repeat the arguments I have already made in another place against this measure. It is a false pretense from beginning to end. It gives free pulp and free paper to publishers using print paper and it gives free farm products, but it will not reduce the cost of living and it will not, in my judgment, widen or enlarge our markets for manufactures in Canada."

**Reciprocity Gains Ground**

The Conservative (i. e., Opposition) candidates in Battleford and Victoria, Alberta, have, respectively, retired from the election contest and announced approval of reciprocity with the United States. Western and Northwestern Canada are safe for reciprocity. A. D. Chisholm, president of the Winnipeg Grain Exchange, says that of thirty-five seats, Sir Wilfrid's friends will carry twenty-two. The Maritime Provinces are likewise regarded as safe, and a Liberal landslide is hoped for in Ontario. The rabbis of Montreal, which has a large Jewish population, have in a circular letter asked their people to support the Laurier candidates. This follows the publication of bitter anti-Semitic utterances in M. Bourassa's journal, *Le Devoir*. Betting odds favor the Liberals, 2 or 3 to 1. At London, Ont., Sir Wilfrid Laurier said last week:

"I am pretty old at the game, and have traveled all the Provinces more than once; and I find today everywhere enthusiasm for the reciprocity compact."

He added at Sudbury, that Parliament would be called together within five weeks from September 21, and that he looked forward to seeing reciprocity within three months. At Stratford the Premier said:

"I call upon you to stand against the unholy alliance of French Nationalists and English-speaking bigots. In Quebec I am represented as an ultra-imperialist, while in Ontario I am represented as an anti-imperialist. In Quebec I am represented as subservient to England; in Ontario as subservient to the ultramontanists of Quebec."

It is not easy to gauge the strength of the Nationalist movement in Quebec Province and its opposition to the Premier. It is a question whether it is not more noisy than strong, however.—— *The Grain Growers' Guide,* organ of the Western grain growers' organizations, says:

"The manufacturers of Canada believe that in opposing reciprocity they are fighting for the retention of the protective tariff. They believe, and rightly, that, once the bogus protection is removed from the farmers, it can never be kept for the manufacturers."

These words may help to solidify the Conservative vote in the East, except that the party is in no less trouble if it defeats reciprocity, for in a few years the West will have the majority of the country's population, and, if it stands together, can rule the Dominion. Thoughtful men see the danger of cleavage, and farsighted Liberals believe that, if reciprocity carries, the West will tolerate a moderate tariff on the products of the East.

**Mr. Kipling to the Rescue**

A letter from Mr. Rudyard Kipling has been cabled from England to the leading organ of the Canadian Conservatives. We quote in full:

"Bateman's Burwash,
"Sussex, England,
"September 6.

"To the Editor of the Montreal *Star:*

"I do not understand how nine million people can enter into such arrangements as are proposed with ninety million strangers on an open frontier of four thousand miles, and at the same time preserve their national integrity.

"Ten to one is too heavy odds. No single Canadian would accept such odds in any private matter that was as vital to him personally as this issue is to the nation.

"It is her own soul that Canada risks today. Once that soul is pawned for any consideration Canada must inevitably conform to the commercial, legal, financial, social and ethical standards which will be imposed upon her by the sheer admitted weight of the United States.

"She might, for example, be compelled later on to admit reciprocity in the murder rate of the United States, which at present I believe is something more than one hundred and fifty per million per annum.

"If these proposals had been made a generation ago, or if the Dominion were today poor, depressed and without hope one would perhaps understand their being discussed, but Canada is none of these things. She is a nation, and, as the lives of nations are reckoned, will ere long be among the great nations.

"Why, then, when she has made herself what she is should she throw the enormous gifts of her inheritance and her fortune into the hands of a people who by their haste and waste have so dissipated their own resources that even before national middle age they are driven to seek virgin fields for cheaper food and living?

"Whatever the United States may gain, and I presume that the United States' proposals are not wholly altruistic, I see nothing for Canada in reciprocity except a little ready money, which she does not need, and a very long repentance.

"RUDYARD KIPLING."

Sir Wilfrid may be expected to quote, in rebuttal, Kipling's own line:

"Daughter am I in my mother's house, but mistress in my own."

**The Fisheries Treaty**

A despatch to the Toronto *Globe* from Ottawa asserts the likelihood that Canada will withdraw from the International Fisheries Treaty concluded with the United States in 1908. Under the terms of the treaty, regulations governing the fisheries in international waters were drawn up by the commissioners, Prof. E. E. Prince for Canada and Prof. David Starr Jordan for the United States. These regulations were to become effective after concurrent proclamations by the Governor-General of Canada and the President of the United States. The necessary legislation was passed by the Parliament of Canada during the session of 1910, receiving the approval of both political parties. The American authorities have failed, however, to pass the legislation required to put the treaty into effect. After the regulations had been drawn up it was found that certain interests, notably in Michigan and on the Pacific Coast, were opposed to their promulgation. It is understood that representations to the

end of modifying the regulations were made to Ottawa, but it is now known that Canada months ago positively declined to accept the suggested modifications, and, it is supposed, has served the United States with notice of complete withdrawal from the treaty. —— If Canada ratifies the reciprocity agreement, Newfoundland may seek political union with Canada to obtain free admission of fish to the American market. Such overtures would receive a most friendly reception at Ottawa.

**The Arbitration Treaties**

Speaking at Hartford, Conn., September 7, at the State Fair, Mr. Taft criticises as "limited and narrow" the attitude of the Senate Committee on Foreign Relations toward the arbitration treaties. He said:

"If the Senate cannot bind itself to submit questions of jurisdiction arising under the treaty, as Norway and Sweden have done, for instance, then the prospect of real and substantial progress is most discouraging."

Mr. Roosevelt, on the other hand, has said that "the proposed arbitration treaty is . . . not straightforward." "There is," he adds, "hopeless confusion as to what 'justiciable' means." But the "fatally objectionable feature" is

"the clause providing that the joint high commission, which may be composed conclusively of 'nationalists' of two countries, but which also may be composed exclusively of foreigners, may, by unanimous vote, or by a vote of all but one of its members, determine that any given question whatever must be arbitrated. It is difficult to characterize this provision truthfully without seeming to be offensive. Merely to speak of it as silly comes far short of saying what should be said."

**The Railways and the Unions**

Unless Julius Kruttschnitt, vice-president and director of maintenance of the Harriman lines, recedes from his absolute refusal to recognize the Federation of Shopworkers or its committees on those lines, labor chiefs say he will be confronted with a strike. No reason for believing that he will recede has been found by labor leaders at San Francisco.——The decision of the machinists is against a general strike in the Illinois Central shops. —— The trackmen's committee has announced that it has asked the president of the Delaware, Lackawanna & Western Railroad to arbitrate their demands.——The Illinois Railroad and Warehouse Commission has ordered a general reduction in express rates applying to all shipments within the State and ranging from 10 to 25 per cent. The express companies agree to "try" the new schedules, which are to go into effect October 1.

**Various Items**

Rodney J. Diegel, Sergeant-at-Arms of the Ohio Senate, has received a sentence of three years' imprisonment for his share in the Columbus bribery case. As a last resort he plans, it is said, to make a full confession.——Senator Arthur Pue Gorman has been unanimously nominated for Governor of Maryland by the Democratic Convention.——The New York Legislature has adjourned until September 18. Governor Dix has told Democratic legislators that he will sign no legislation during the reconvened session unless he first receives a direct primary bill fulfilling the pledge in the Rochester platform. He does not insist upon the nomination of all State officers by the direct primary. But there is as much opposition as ever.—— A. C. Frost, of Chicago, and forty-eight other claimants of the Watson coal lands in the Matanuska District of Alaska, have been cited by the Juneau (Alaska) Land Office to show cause within thirty days why their claims should not be canceled. This action is thought to be based upon evidence discovered by the United States Grand Jury which indicted them. The Juneau civil action does not interfere with the Chicago criminal action.

**Stormy Times in Mexico**

There was much disorder in Mexico, last week, at campaign meetings and in places where ambitious lieutenants of Madero still defy the Government. Troops were sent to subdue General Banderas, who by force had made himself Governor of Sinaloa. General Huerta, who had entered Cuantla with 3,000 soldiers in pursuit of Zapata, set out to run down Zapata's men in the hills of Morelos, to which they had withdrawn. He had orders to take Zapata, dead or alive. In Yucatan, on the 4th.

troops of the State fought with 100 armed bandits, killing many of them. Agents of Magon, the Socialist, were at work in the South, as well as along the northern border. Five of them were arrested. It is said they were planning an uprising in Vera Cruz. There were about 200 Magonists in El Paso, and as many more in Juarez, pretending to be supporters of General Reyes. These, it was asserted, were plotting to capture Juarez, which they were to attack by means of nitro-glycerine bombs dropped from kites.——In his public addresses Madero repeated his charges against General Reyes, his most formidable rival. At Vera Cruz, on the 7th, he said again that Reyes had plotted to have him shot, was trying to rob him of the fruits of his victory over Diaz, was a traitor and ought to be banished. At many campaign meetings there were riots, in which Maderists attacked Reyistas. At Madero's meetings the name of José Piño Suarez (nominated by the Progressive party for Vice-President on the Madero ticket) was hooted by many who preferred Dr. Francisco Gomez. In the convention Suarez (now Governor of Yucatan) had 615 votes and Dr. Gomez 600. The latter's supporters withdrew from the convention hall, saying that Suarez had won by corruption. It is reported that Gomez promises to publish documents indicating that Madero in the revolution had the aid of certain Trusts in the United States. His brother, Emilio, has been nominated for President by a small party, and he himself will probably be nominated by the anti-re-electionist organization. —— Madero publishes the following statement concerning his recent interview with Lord Cowdray:

"Lord Cowdray, representative of the house of Pearson, called upon me in order to inform himself as to what my intentions were with regard to the important undertakings which he has in this republic. I said to him that all capitalists, foreign as well as national, would have every guaranty under my Government and that I should always with pleasure see foreign capital invested in Mexico. With regard to the concessions which he holds from the Mexican Government I assured him that if he had duly complied with the respective contracts he had nothing to fear, as my Government will respect contracts and concessions which have been formulated with the late Government in compliance with all legal requirements. I also said that I consider his action in combating the monopoly of the Waters Pierce Oil Company has been beneficial to Mexico. But as I have repeatedly said, my Government will always endeavor to oppose monopolies."

——At the end of last week Madero went to Yucatan, intending to remain there several days, as the guest of Governor Suarez.——There may be more Reyes meetings now, for the order prohibiting demonstrations within the Federal district has been withdrawn. General Reyes has received permission, also, to retire from active military service. This permission is based on the fact that he has served continuously for thirty-five years. Dr. Francisco Vasquez Gomez is now said to be a probable running mate with General Reyes against Madero and Suarez. José del Vaile has until recently been slated for the Vice-Presidential nomination.——After a half century of war with the Yaqui Indians the Mexican Government has made a peace pact which calls for the return of all exiled Indians from Yucatan, Chiapas and other tropical States to their native Sonora and the surrender of Sonora lands to the Indians. Provisions of the agreement follow:

The Federal Government cedes to the Yaqui Indians the lands which belong to the national Government in the jurisdiction of the towns of Torin, Vicam, Potam and Rham, as well as the Vicam Canal.

The land will be broken for cultivation at the expense of the Government, the Yaquis themselves doing the work; for which labor they will be paid $1 a day.

Each couple when they marry shall receive seven and one-half acres; each person reaching the age of majority shall receive five acres; each minor, two and one-half acres.

To each family which, in the distribution of lands, receives from five to ten hectares, the Government shall give a pair of mules and the necessary implements for work. The families which receive less than five hectares shall receive one mule and implements.

The Government shall provide a storehouse from which the new colonists will receive subsistence until after the first harvest.

The Government shall establish the number of schools for both sexes which it believes necessary, and all the Yaquis shall solemnly compel their children of school age to attend

The Government shall erect one church within the limits of each town.

The Yaqui colonists shall be exempt from taxes for a period of thirty years.

The Yaquis shall name their own local authorities, but shall recognize the general authorities of the State and of the republic.

**The Franco-German Clash**

While no official notice has been given of the contents of the communications between Germany and France as to their Moroccan dispute, this much is known, that Berlin has received the offer from France as to certain compensation in the Kongo for a freer hand in Morocco, and has sent its reply. We do not know how trustworthy are the reports as to the substance of the demands and concessions; but according to the London *Daily Mail*, which claims knowledge, full liberty is to be granted to France in Morocco to conduct any military action necessary to maintain order, which would be tantamount to a protectorate. France would guarantee free commercial rights there to Germany. According to this statement, the sacrifice of territory in the French Kongo which France is prepared to make, tho not so great as Germany demanded, is of such an extent that when it is known the French people will be astonished and perhaps exasperated; but compensation will be found in the conditions which the French Government insists upon in Morocco. These agreements, it is declared, are to be embodied in a general treaty of European Powers with which the United States would also join. It was believed that Germany would accept the conditions in principle, but would ask changes in some particulars; but it is since reported that the German counter-proposals will be rejected. They are said to require an outlet to the Kongo, French responsibility for the Moroccan Government, 40 per cent. of all public contracts, a most favored nation clause, and the free export of ore. The communications between the two nations are likely to continue for weeks longer. Meantime great anxiety appears in the financial centers, with a severe drop of prices of securities, and the military precautions are not relaxed. Russia stands fast with France, as does Great Britain, and in case of war would threaten the German frontier. At just this time Emperor William reviewed his navy at Kiel. The three monster superdreadnoughts were there, but did not take part in the review, as they are not yet in commission, but ninety-nine fighting ships took part, not including torpedo boats, torpedo boat destroyers and submarines. Germany's navy is now second only to that of Great Britain, while that of the United States has fallen to the third rank.——It is anticipated that if the present negotiations between France and Germany over Morocco terminate satisfactorily, Italy will occupy Tripoli and Cyrenaica, from French Tunis on the west to British Egypt on the east, and as far south as the oasis of Kufarat. Italy is said to be negotiating with Turkey, whose sovereignty in Tripoli is hardly more than nominal.

**Food Riots in Europe**

In Germany as well as in France the great increase in the cost of living causes anxiety, altho it has not led to food riots, as in France and in China. The summer drouth is spoken of as a main cause of the rise of prices. The Berlin Chamber of Commerce and the Merchants' Guild have petitioned the Government to reduce the tariff on grain, fodder, etc., by applying a special classification to these products, and to cut the duties on potatoes by 50 per cent., the new rates to be effective until August 1, 1912. The Minister of Agriculture has ordered the sale of fodder to needy persons at reduced prices. —— The French Cabinet has been studying the causes of the food riots in which women took so active a part. The cost of everything eatable is higher thruout France today than ever before. Prices suddenly increased this summer, but this also is true all over Western Europe, and was caused principally by drouths and the consequent failure of fodder and vegetable crops. The Cabinet approved a scheme to ameliorate the situation by facilitating the importation of cattle and frozen meats by installing refrigerating and storage plants, of which there is a lack in France; by demanding that the railways lower their rates for the transportation of food, and by suspending the tariffs on fodders.——At Charleroi, in Belgium, 20,000 persons of the working class, protesting against the high cost of food, attempted to march into the lower districts of the city. Squadrons of cavalry charged thru the various streets and succeeded in dispersing the crowds after two hours of hard work.

Some of the manifestants were injured. All the stores were closed. The gold mines of the Johannesburg district yielded in August over $12,000,000, which breaks all records for a month; and for some years the gold production has been steadily increasing. At the meeting of the British Association last week Professor Chapman connected these food riots with the depreciation of the value of gold, and showed that in the last ten years the price of the necessities of life had risen 10 per cent. This applies particularly to meat, and to bacon, the poor man's meat, and to bread, milk and sugar. Professor Chapman predicted that the next three years would be an era of strikes, due to the fact that whereas up to 1896 the cost of living had been falling, it had since then been rising.

**Portugal**

Since the election of Manuel de Arriaga as President of the Portuguese Republic affairs have moved very quietly, and no progress seems to have been made by the Royalists in the northern provinces and over the Spanish border. A promise of more quiet is given in the announcement that the severe laws against the Church which were at first decreed will be considerably modified, the State to be completely separated from the Church, all ecclesiastical property which belonged to the State to be returned to the Government, all ecclesiastical property which pertained to the clergy to continue to remain so, all priests to receive stipends until death, no confiscation of property to be made, entire liberty for all the religions to be conceded, the State not interfering either directly or indirectly, the British, French, German and Italian churches in Portugal to continue as heretofore to enjoy perfect freedom. The announcement has made a good impression, and if enforced on these lines it will do much to conciliate the north with the south. Apart from the danger from the Royalists and their ecclesiastical allies is that from the multitude of carbonari in Lisbon, estimated at 30,000, who are always ready for a disturbance, and who have their leaders, and who must be considered in all legislation. An investigation of the Royalist forces shows 5,000 soldiers of all arms, with quick-firing guns, but they lack funds expected from England and Brazil. Much interest is excited by the discovery of a great hoard of gold and jewels in the vaults of the Cathedral of Oporto, which must have lain there for several centuries. The chests are filled with ingots of gold, gold plate and ornaments studded with rubies, and church furniture of pure gold. They date from a time when Portugal was a rich colonizing power.

**The Cholera**

The ravages of the cholera in Italy have interfered with the usual influx of visitors, and we have accounts of its spread to other countries. Several cases have developed in Vienna, and in Spain it prevails in the Province of Tarragona, where 75 per cent. of the cases prove fatal. There are frequent cases in Mediterranean and Adriatic ports. Russian maneuvers on the Manchurian border have been postponed because of the cholera. The International Parliamentary Conference, called to meet in Rome, is likely to be postponed for a similar reason. In two Italian towns mobs have attacked the pesthouses, and triumphantly carried the cholera patients to their homes. It is their belief that the doctors are spreading the disease. The pilgrimage to Loreto has been forbidden. Cholera has broken out in the Turkish army. On a militia train near Salonika the soldiers were so frightened by the appearance of cholera among them that their comrades threw twenty of those stricken out of the windows to die. The War Office has ordered their officers and doctors to be court-martialed. The disease has spread among the soldiers returning from Albania, and three battalions that were quarantined demanded to be sent home, and when this was not allowed they mutinied; but the mutiny was suppressed and the leaders executed.

**The Chinese Famine**

The first alarming reports that came to the world were from missionaries in the central provinces of China, to the effect that 300,000 persons were suffering from famine in the upper waters of the

Yangtse River, and that 100,000 persons had been drowned by the floods. Of course, the numbers are uncertain, but that the disasters are of great extent is certain. Hundreds of miles of the river valley have been transformed into an enormous lake, destroying life and crops. Missionaries report it as the worst flood they have known, extending from Chinkiang to Ichang, about 800 miles, and from 100 to 200 miles wide. One writes from Wuhu:

"The future of Central China hangs like a great dark cloud. We are powerless to save even many of our church people. The members were farmers, and all they have is a bit of rice tied up in the tops of trees, while they themselves are paddling around in tubs. O, the thousands of orphans there will be in our district!"

From Chang-teh, in the Province of Hu-nan, comes word that the receding water is being followed by pestilence. That district hardly contains a survivor who has not been affected by the scourge, and many are dying. The Chinese Government is preparing to give what relief it can, and the International Relief Society at Shanghai will give its aid. The floods were at their hight in August, but have since receded. The price of provisions has risen so high, even in Shanghai, that in order to prevent a rising the officials have issued a proclamation forbidding merchants from making any increase in the price of rice, which is already higher than hitherto known. Millions of people have fled to the hills, where they have no shelter and are starving for lack of proper food. Bands of refugees are beginning to march toward the larger cities, pillaging and burning. The whole district of Changshu, near Soochow, has been swept by them. Rice shops have been looted or destroyed and Government buildings burned. The walled city of Soochow is also threatened and several shops have been attacked. The military has so far held the crowds in check. In order to protect Nanking, troops have been called out to stop the advance of refugees, but it is feared that as soon as the water abates millions from the hills will join the general movement and overrun the country unless relief is conveyed to them. All ports along the Yangtsze report floods in the streets. Hankow, Ngankin, Wuhu, Chinkiang and Nanking are submerged and houses are flooded. At Wuhu the distress is most acute. The Central China Famine Committee, of Shanghai, is reorganizing as a general committee, the American consul, Mr. Wilder, to act as chairman.

**The Chinese Riots**

That the lack of food following the floods which covered the rice fields just as the rice was maturing would necessarily lead to violence and riots was to be expected, but apart from that, and in some provinces not so severely affected, another occasion has been opposition to the extension of railroads, especially in Sze-chuan. From the State Department at Washington we have the following explanation:

"Recently an imperial edict was issued placing under the Ministry of Communications of the central Government the construction of all trunk lines thruout the empire and canceling all concessions for the private construction of trunk lines previous to the year 1911. This measure affected the line which was being built by Chinese private enterprise in the Province of Sze-chuan and has doubtless precipitated the present manifestations in a province always considered more than ordinarily turbulent, one where reactionary tendencies, the cry of 'China for the Chinese' and a certain amount of anti-foreign tendency have made local appreciation of the economic and progressive measures of reform and industrial development introduced by the central Government more slow to be appreciated and understood than in other parts of China. There is no reason whatever to attribute the present uprising to the recent railway projects in which the United States is interested. In fact those railways as now planned and under present concessions lie wholly outside of the province of Sze-chuan."

The agitation in Sze-chuan was at first confined to public meetings, the closing of shops and the refusal to pay taxes. But the situation became so serious that the American and British women were removed to a place of safety at the Canadian Methodist mission compound in Chengtu, altho the agitation was not directed particularly against foreigners. There are about a hundred Americans in the neighborhood. A British gunboat has been ordered to anchor near Chengtu to protect foreigners or to rescue them if necessary; and our own navy has several available gunboats.

# The New Labor Spirit in England

BY SCOTT BOWEN

ALTHO "social revolution," in the sense that the term is used by extreme Socialists, has not begun, yet the theory that the recent strikes in England differ only in size from those that have gone before, is far from the truth. The fact is that English labor organizations are entering on an entirely new phase of their development, and that the old trade unionism is dead. It has given place to Continental "syndicalism," and the success of the recent strikes so far has justified the change, from the viewpoint of the working class. It is doubtful if England will ever again see a great strike run on the old lines.

The trouble up to now has affected the trades that mean most to the every-day life of the community, and so has brought home the situation to the great mass of the English people. First the miners went on strike, and the price of coal immediately went up. Extra police and troops were needed to keep the strikers in order. Then the sailors struck, and every dinner table in the land was threatened, for England depends for her sustenance on sea-borne food. Then the dock laborers and carters in London and Liverpool and all the other big ports went out, and in some of these towns there was an actual shortage of food, altho tons of it were rotting at the docks and in the ships. Then, to crown all, railroad men all over the country struck. This last strike threw England into something like a panic. More than 25,000 troops were rushed into London, and soldiers in proportionate numbers were thrown into all the other great towns and placed on guard over the railways at strategic points. Preparations were made to move food trains under military guard, and, if need be, to work them by soldier labor. At the last moment the Government, by promising an investigation of the men's grievances, induced them to return to work, but in the temper that they are in they may come out again at any moment if the investigation does not result to their liking. It is not at all unlikely, judging from the make-up of the commission of inquiry, that this will be the case. The chairman, Sir David Harrel, is an ex-police official. The labor members are weak and the railways are represented by one of the cleverest railway lawyers in the country.

A few years ago all this would have been impossible. The English unions were bodies of skilled workers organized on the aristocratic principle. None but men who had learned their trade by long and severe apprenticeship were admitted to the unions. The union charges were heavy, and the money was devoted to building up strong funds which were used for sickness and out-of-work insurance, and for similar purposes. In the last resort the union's funds might be used to finance a strike, but naturally men like the better-class British workman thought long and seriously before embarking in any struggle which might deplete these funds. The sympathetic strike was practically unknown, and federations of men in allied trades hardly existed. Even in the same trades, such as mining, for instance, the men of one county were often organized quite independently from those of another, and worked under different wages and customs. Under conditions such as these little progress was made. The employers, by taking one trade at a time, could defeat them all in any struggle, and, moreover, this system made no provision for the great mass of unskilled or half-skilled labor on which so much of our modern industrial system depends.

A few years ago the English workingmen began to wake up to the fact that their unions were not working as well as they should. They saw their funds depleted by strikes forced on them by the employers. They saw their organizations weakened by the growing army of the unemployed, most of whom were not eligible for membership in the old-fashioned unions, or who, if they were, could

not pay the charges. They began to cast about for some new method of carrying on the industrial war, and they hit on the political weapon. A fairly strong Labor party was returned to Parliament, and the English workingman hoped that all his grievances would be settled at once.

But the Labor party has done little but talk, and already there are grave rumors that it has been captured by the Liberal party. Some of its leaders have already received minor offices, and the story goes that one will soon enter the Cabinet. At any rate the Labor party has not justified the laborers' expectations, and the English workingmen, seeing their lot growing steadily worse—for altho times have been good and prices rising, wages have remained stationary—began to look for still another weapon. They found it in the Continental syndicalism, which is distinguished from the old-fashioned English unionism by the fact that, instead of being organized by trades, the men are organized by industries, and that, moreover, the solidarity of all labor is recognized.

The first fruits of this syndicalism have been seen in the strikes of the sailors, cartmen, dockers and railway men. They are all part of the new organization of transport workers, and it is recognized that by acting together they can paralyze the trade of the country. They have done so already for a short time, and, now that they know their power, they may be expected to do so again. In the old days the locomotive engineers might strike and find their places taken by other railway men who had enough knowledge of engines to serve at a pinch. The conductors and signal men might strike, but if the engineers remained at work some sort of a railway service might be maintained. The porters might go out, but outside cartmen would load their own carts, and the same might happen at the docks if the 'longshoremen

AN ARREST IN THE LIVERPOOL STRIKE

ceased work. Now all these men are acting together at a common signal and there is no one to take their places.

There can be no doubt that in the case of the highly skilled railway workers this development has been hastened by the shortsightedness of the employers. The English railwaymen have had serious grievances for a number of years. They consider themselves underpaid and overworked, and from an American standard they certainly are justified in both claims. In 1907 they threatened to strike, but Lloyd George, now Chancellor of the Exchequer, then president of the Board of Trade, intervened and fixed up a conciliation scheme, which was accepted by both employers and men. If it had been worked in good faith by the employers perhaps the railwaymen would have stuck to their old-fashioned conservative unionism, but, instead of being used as a piece of machinery for the redress of grievances, it was used by the railway managers as a means of putting off the consideration of the men's complaints.

Put as briefly as possible, the machinery of the scheme was this: On every railway system a conciliation board was set up, composed of an equal number of representatives of men employed on the line and of the company. All grievances were to be brought before these local boards, and in case of failure to agree an appeal could be taken to a general board, and from this general board to an independent arbitrator to be specially appointed in each case. The idea was that complaints would be dealt with promptly by men who understood the conditions. In actual working it has taken months and in two cases at least two years to get a case heard by the general conciliation board. Moreover—and this was the chief grievance of the men during the recent railway strike—the companies absolutely refused to recognize or deal with the men's unions. Before all the local conciliation boards grievances had to be presented by men actually in the employ of the company against which the grievance was alleged. Plain porters and enginemen and switchmen had to argue their cases against the skilled officials of the company, and of course they usually got the worst of it. They were handicapped also by the feeling that if they made too good a case against their employers they were likely to be punished for it before long by loss of employment or deprivation of privileges. In these circumstances it is not wonderful that the men felt they had been cheated by the establishment of the conciliation boards, and the chief of their demands in the recent strike was recognition of the union, and the right to have their grievances presented by their own union officials, men skilled in the art of bargaining with employers and quite independent of any vengeance by the employers.

In fact, this question of recognition of the unions has played a leading part in all the strikes. The dockers and cartmen, of course, won substantial advances in wages, but they prize quite as much the right to nominate their union officials to present all complaints to employers, and to conduct all negotiations with them about wages and conditions of labor.

When I said at the beginning of this article that the new movement among the English workingmen did not mean that the social revolution had begun, I had in mind the fact that it is not a Socialist movement in the ordinary sense of the term. It is true that the two men who, more than any others, have been responsible for the adoption of syndicalism by the English workers—Ben Tillet and Tom Mann—are radical Socialists, but they have not been preaching socialism except incidentally in this movement, and the great bulk of the English workingmen are not Socialists. In fact the political Socialists in Parliament have been rather opposed to the new movement—altho they did not dare to fight it openly—it being a symptom of disgust with the failure of parliamentarianism and therefore hostile to them. The old trade union leaders, much against their will, have been swept into the movement and forced to take the lead in it. This is a curious example of a wave of democratic sentiment. For years the trade union officials in England have been little autocrats, dictating to their followers what policy they should adopt, and in general managing all their affairs. Al-

NINE POLICEMEN GUARDING ONE LOADED MOTOR TRUCK

most in a night the workers themselves took charge and showed their leaders the way they wanted to be led.

Syndicalism, however, is a great weapon in the hands of the workers. The general strike has long been the ideal weapon of social revolutionists. We have had an uncommonly near approach to it in England, and it has been successful, probably far more successful than the organizers hoped; for when it was at its hight in London the post office authorities had to apply to the strike leaders for permission to move fodder for their horses and petrol for their automobiles in order to keep the mail service going, while the hospitals also had to apply for permits to cart in food and supplies. The spectacle of the Government bowing down before a strike leader is one that has impressed all classes mightily and the workingman not the least. He feels that he has a new and powerful weapon in his hand. Who knows how he will decide to use it?

One feature of the new situation which is especially dangerous to private property in England is the fact that Continental syndicalism is distinctly anarchistic as opposed to the Socialism of the old trade union movement. I do not mean by this either that the old English trade unionists were consciously Socialists or that the new syndicalists are consciously Anarchists. It is true, however, that the ideal of most of the old trade union leaders was a form of state socialism—either control in some form or absolute ownership by the state of the great public services and industries. Those who did not go the whole length of accepting state control, or ownership at any rate, looked to the state to redress their grievances by legislation, and legislation in England has been moving along these lines, especially since the present Liberal Government came into power. It has not moved fast enough, however, and most of the attempts to legislate socialistically have failed to work, and have

therefore caused irritation and unrest among the laboring folk. Now they are swinging to the other extreme, which is known on the Continent of Europe as "direct action." The ideal of the anarchist communists, of which Prince Kropotkin is the ablest and best known exponent, is the control of industry by the men actually engaged in it. Kropotkin's idea is that the railwaymen, for instance, shall run the railways, the bootmakers the boot factories, the sailors the ships, and so on, and that these so-called "free groups" shall exchange with each other. This seems to be the idea in a vague way underlying the new English labor movement. The workers feel that they have been unfairly treated by the state, and they no longer look to it, but to their own efforts, for protection and improvement. The ideas of federation by industries and control, if not complete ownership, by the men employed in them are the bases of the new movement.

On the other hand, the politicians have received an impulse in the direction of State Socialism. The railway strike, by tying up the food supply of the country, and, more than that, by rendering the railways useless from a military point of view at the moment of a serious European crisis, has awakened the politicians to the danger of leaving a great public necessity like the railways at the mercy of a dispute between masters and men. It has forced to the front the demand for nationalization of the railways which has been a real one for some years in England. It is unlikely that if the politicians come to the conclusion that the railway must become national property they will meet with much opposition from the railway directors or shareholders, for English railway securities are no longer particularly gilt-edged investments, and few of the shareholders would object to exchanging their share certificates for guaranteed Government stock. The railway workmen would not object, because they believe that they could coerce the state by striking more easily than they can the companies. A few years ago they might have hailed nationalization as the dawn of a new era. With the new spirit of today I believe they would simply look on it as a change from a strong, harsh master to a weak one.

LONDON, ENGLAND.

# Of Fire and Flesh

BY MARGUERITE OGDEN BIGELOW

Of fire and flesh a man is made—
  The flesh that molds earth's highest race,
And thru strong sons has strongly swayed
  Her lesser beasts to yield him grace;
Of fire, the same that smouldered slow
  In magi of the ages dim
And now flames up to meet the test
  Of times that search the soul of him.

The air has granted right of way
  That his high voice may sound afar;
The rocks have parted that his eyes
  May learn how rich their treasures are;
His cities, builded to the sun,
  Sing from within their ribs of steel
The song of thousands, whose tense hearts
  The throbbing pulse of progress feel.

Of fire and flesh—and they are strong,
  Our brothers of this saner day,
With grand new strength that bids not. "Strike!"
  But rather, "Hold the stroke away
From all the weak, who strive and fail
  From all the strong, who, failing, strive;
You shall not cast the flesh to earth,
  But rather, keep the fire alive."

Of flesh and fire—both God and beast
  Deep mated in our battled lives;
And who can tell how long, how long
  Ere beast is sped, ere God arrives?
Our utmost thought can only guess
  That out of one the other grows—
The flesh that slumbers in the bud
  Shall wake flame blossom in the rose!

MONTECITO, CAL.

# A Model Municipal Charter

BY PROF. WILLIAM C. JONES

PROFESSOR OF JURISPRUDENCE IN THE UNIVERSITY OF CALIFORNIA.

CITIES in California are allowed by the State Constitution to exercise a large measure of home rule. Any city with a population over 3,500 may elect a board of fifteen freeholders to frame for itself a charter. A charter so framed is then submitted to the electors of the city, and, if approved by a majority of those voting thereon, is sent to the State Legislature for its ratification as a whole, without power of alteration or amendment. While it is doubtless within the competence of the Legislature to reject a freeholders' charter, such action is unknown in California, all charters submitted having been ratified as a matter of course.

Berkeley was incorporated under a special charter (a form abolished under the Constitution of 1879) in the year 1878. In 1894 it adopted a freeholders' charter. At that time it had a population of some 6,000; in 1900 the population was 13,214; it is now about 42,000. In 1908 a board of fifteen freeholders was elected to prepare a charter adequate to the needs of the growing municipality. This charter was adopted by the voters of Berkeley on January 30, 1909, by a vote of 3,178 to 546. An alternative proposition prohibiting saloons was adopted at the same time by a vote of 2,400 to 1,288, and thereby became a provision of the charter. The charter was subsequently ratified by the Legislature. The election of city officials has taken place, and the new government went into full operation on July 1.

This charter is framed on the "commission" principle. It is designed to realize democracy in city government and to secure prompt, efficient and economical administration. It is believed to be a complete working scheme and consistently to maintain the principle on which it is based. It is prepared in the light of the California Constitution, but, with slight variations, would be generally applicable in any city in the country.

The central pivot is the council. This body consists of five members, one of them being the mayor. The council acts as a directorate and exercises the executive and administrative functions of the city, and, subject to the potential sovereignty of the people, all legislative power. As to the executive and administrative functions, the mayor is the chief executive officer, and is empowered to exercise oversight of all the departments of the city. He is specially charged with the supervision of all public service companies. He might be designated the commissioner of public utilities. Each of the four councilmen, called commissioner when acting in an administrative capacity, is placed at the head of one of the several departments, finance and revenue, public health and safety, public works, and public supplies. The assignment to these several departments is made by the council itself at its first meeting. Reassignments and redistribution of functions may be made at any time when it is deemed that "the public service will be benefited thereby."

With the exception of auditor and school directors, all the city officials are to be appointed, and may be removed, by the council. The chief officials named in the charter are city clerk, assessor, treasurer, collector, attorney, engineer, chief of police, fire chief, street superintendent, health officer and five library trustees. But these offices may be consolidated by the council, and other positions may be created and filled by it, to the end that the needs of the community may be most advantageously administered. Religious or political opinions, affiliations or services must not be taken into account in making appointments or removals. The commissioners are accountable to the community for the character of the service rendered

thruout their several departments. A number of commissions, to serve without compensation such as civil service, civic art, park, playground and public charities, are provided for.

With respect to the powers and objects of legislation, the charter is framed with great care, with the aim that the city shall not, in any contingency, be found lacking in desired authority. There is consequently a long—it is hoped virtually exhaustive—enumeration of local powers, primarily and ordinarily to be exercised by the council, but with reservaton of control by the people. Broad, general powers are likewise conferred upon the city for the acquisition, by purchase, condemnation or otherwise, of public buildings, places, works and institutions, such as libraries, museums, parks, baths, markets, hospitals, farm schools, quarries, wharves and waterways. The acquisition is also authorized of water, light, heat, power, telephone, telegraph and transportation facilities of whatever kind. Provision is made for Berkeley joining with its neighbors (San Francisco, Oakland, Alameda) for the joint development and ownership of a water supply.

Municipal ownership is not made mandatory by the charter, but its easy realization is made possible whenever the community may be so minded. Municipal ownership need not preclude private operation.

In the matter of accounts and reports, it is provided that the council shall prescribe uniform forms of accounts, which shall be observed by all officers and departments which receive or disburse moneys. Whenever the State Legislature shall pass an act calling for uniform municipal reports the city authorities shall be governed thereby. It is made the mayor's duty to employ a certified public accountant, who shall examine at least twice a year all the books, records and reports of the auditor and other officers. The accountant is given "unlimited privilege of investigation, to examine under oath or otherwise all officers, clerks and employees."

The procedure for making department estimates and preparing the annual budget is carefully outlined. Estimates originate with the heads of the several departments and are reported to the commissioner of finance and revenue, who makes his report thereon to the council. This latter body prepares the budget and makes the tax levy. In common with most Californian cities, the Berkeley charter establishes a tax limit, namely, $1 on the $100 of the assessed valuation of all property. This, however, does not include the tax to meet the interest and provide a sinking fund on the bonded indebtedness and for the support of the library and reading rooms. Out of the $1 tax rate, not less than 35 cents shall be apportioned to the school fund, whenever the board of education calls for that amount.

Provision is made by which it is hoped that the finances of the city may eventually be put on a cash basis. A permanent fund is to be established by turning into it 2½ cents on each $100 of the assessed valuation, until the accumulated amount shall be sufficient to meet all legal demands against the treasury.

The interests of the city are safeguarded in the matter of letting contracts. Here, as in some other places, charter discretion is somewhat limited by the State Constitution, as, for instance, by the requirement that contracts with water companies shall not exceed one year. It is hoped, thru the establishment of a special commissioner on public supplies, to obtain better results than municipalities ordinarily enjoy when making purchases.

The article on franchises, it is believed, is worked out in a highly satisfactory manner on the theory on which it proceeds. This theory may be disputed, but seems to be the one best adapted to the present state of local opinion and to a community situated like Berkeley, namely, one autonomous municipality adjoining or surrounded by several similar municipalities. All transportation companies, as well as water, gas, electric and telephone companies, must from the very nature of the case be interurban in their operation. No single city, so situated, is free to deal independently with these public service corporations. By the Berkeley charter franchise grants are made subject to public bidding. Each grant must provide for not less than

2 per cent. of the gross annual receipts to be given to the city during the first ten years, not less than 3 per cent. during the next ten years, not less than 4 per cent. for the next ten, and not less than 5 per cent. for the remainder of the life of the franchise. The franchise is to be granted to the person, firm or corporation bidding the highest percentages above these minima. The life of a franchise is limited to thirty-five years.

Reservation is implied in making every franchise grant of the power to make regulations for the safety, health and accommodation of the public, and for rates, fares, rentals or charges made for the service rendered under the franchise. The city shall have power, likewise, to assume ownership of the property and plant of the grantee upon payment of a fair valuation, and without the necessity of any instrument of conveyance. Franchise companies must make annual written reports in such form as may be prescribed by the city, and must have their books open to the inspection and auditing of the municipal authorities. Provision is made for the forfeiture of franchises for cause.

Such is an outline of the working machinery of the city government. To show how this is made efficient and the officers rendered responsible, the other main features of the charter must be observed. These features are the method of nomination and election, the recall of elective officers, and the initiative and referendum.

Nominations for elective offices are made by petition only. Any qualified person is nominated upon there being filed in his behalf twenty-five verified certificates of nomination, each signed by one voter. There is no limit to the number of candidates for a given office. Two elections are provided for, three weeks apart. A candidate is elected at the first election only if he receives a majority of all the ballots then cast. For all places not filled by a majority vote the first election is regarded as a primary, and the two candidates who received the highest number of votes become the nominees at the second election. Names are placed on the ballot in alphabetical order and without anything indicating the source of nomination or support. The maximum number of places to be filled at an election under the Berkeley charter is ten: Mayor, auditor, four councilmen and four school directors. Ordinarily there will be but six, elections being biennial, the mayor and auditor holding office for two years, and councilmen and school directors for four years, two going out of office every two years. Attention is thus centered on a few offices, and even a large number of candidates is readily sifted by means of the two elections, and a majority vote choice secured. Interest is attracted to the primary by making it decisive in the case of any candidate receiving a majority of the ballots.

All nominations and elections are at large. Wards are abolished, no mention of them being made in the charter.

Ready accountability is obtained thru the recall provision. An election to determine whether a given official shall be allowed to remain in office or be replaced by another person may be brought about by a petition signed by voters equal to 20 per cent. of the votes cast for mayor at the last election. This petition may call for a special election or for a vote on the recall at the next general election. Unless the officer against whom the petition is filed resigns, the council must call the election as requested. At the recall election the incumbent's name is placed on the ballot, unless he has resigned, and other candidates are nominated as at ordinary elections. The published notice of the recall election must set forth, within the limit of 200 words, the reasons given for asking the recall and also a statement, within the same number of words, if the official so desires, of his defense. No recall petition shall be filed within three months after an official has taken office. No person who has been recalled or has resigned pending recall proceedings shall fill an appointive office within one year.

Direct legislation by the people is provided thru the initiative and referendum. The Berkeley charter proceeds on the principle that with respect to most matters municipal ordinances are merely regulative and administrative in their character. It is by a false analogy, generally speaking, that a separation of

legislation and the execution of laws is insisted upon in the case of cities. If the determination of questions of larger policy is reserved to the people, there can be no objection to confiding the making and the administering of ordinary rules and regulations to one and the same representative body.

The Berkeley charter provides that "the qualified voters of the city shall have power, thru the initiative and otherwise, as provided by this charter and the general laws of the State, to enact appropriate legislation to carry out and enforce any of the general powers of the city or any of the specified powers of the council." And further:

"No ordinance passed by the council shall go into effect before thirty days from the time of its final passage, except when otherwise required by the general laws of the State or by the provisions of this charter respecting street improvements, and except the ordinance making the annual tax levy, and except an ordinance for the immediate preservation of the public peace, health or safety, which contains a statement of its urgency, and is passed by a four-fifths vote of the council; provided, that no grant of any franchise shall be construed to be an urgency measure."

All ordinances except those mentioned are subject to the provisions of the referendum.

The government of the public schools of the city is placed in the hands of a board of education consisting of five members. Four of these are elected as school directors, and the fifth is the councilman who is acting as commissioner of finance and revenue.

The first municipal elections under the Berkeley charter were held on May 1 and 22, last year, and were a highly satisfactory vindication of the methods provided. It was the first time in many years that the enthusiasm of the people was aroused in a local election. At the first of the two elections there were four candidates for mayor, four for auditor, twenty-nine for the four places on the council, and twenty-one for the four school directors. At the election on May 1 one candidate for mayor (Beverly L. Hodghead) and one candidate for auditor (M. L. Hanscom) received a majority of all ballots cast, and were thereby elected. At the election on May 22 eight candidates for councilmen and eight candidates for school directors remained on the ballots, and those who had received the highest number of votes at the first election again received the highest number and were elected. While all the candidates who survived the first election were desirable men, the final result is regarded as a triumph of the "Good Government" forces.

BERKELEY, CAL.

# At the Wheel

BY CORNELIA KANE RATHBONE

Down the on-rushing road I glide,
  Outstripping the haste of the wind:
Cloud chariots race by my side,
  Black Grief falls behind.

Its gates to a golden chime
  The world flings open to me,
I am conqueror of space and of time,
  I am lord, I am free!

But who sighs in the rustling leaf,
  Who shadows the bending grain?
By the short cross-road black Grief
  O'ertakes me again.

"Then ride with me, Grief," I cry,
  "Since thou wilt not let me go;
Sit now by my side while I fly,
  While the hills bow low."

I speed; the night falls fast
  Over hills grown steep and black:
I creep 'neath the lash of the blast
  Thru a world without track.

"Oh, Grief," then I cry, "take the wheel:
  Storm-beaten I yield!" Then afar,
As blind thru the darkness I reel,
  Breaks the smile of a star.

And beneath me the wheels turn wings,
  To the mountain's far peak I soar;
Day wakes for me, flushes and sings;
  Heaven opens its door.

ALBANY, N. Y.

# "How I Fly"

BY CLAUDE GRAHAME-WHITE

[Mr. Grahame-White is the well-known English aviator who has carried off many prizes in this country. He was flying last week at the Harvard-Boston aero meet, where he won the flight to the Boston light and back. With a squally twenty-mile wind blowing he covered the fifteen miles at a speed of more than a mile a minute.—Editor.]

"HOW is it done?" This question is addressed to me so frequently after I have made a flight that I have decided, in the following article, to explain what makes an aeroplane fly, and also how it is that the aviator is able to control it when in the air. Altho people have seen a good deal of flying already in this country, it has been surprising to me to note how little even now is known about the practical aspects of flight.

It is, fortunately, quite easy to describe flying without becoming technical. My endeavor will be to explain what I do, and why I do it, in a way that any person not versed in aeronautics will be able readily to comprehend.

The machine I shall take for purposes of description is the Farman biplane, which I fly so often, and which is a standard type of air-craft. To begin at the very beginning, we will first suppose that we are watching the aeroplane moving along the ground prior to a flight.

At the rear of its two main-planes is the engine. This, revolving at a thousand revolutions a minute, carries round with it the propeller, and so forces the machine along the ground. The propeller of the aeroplane is constructed very carefully from layers of special wood. It has two blades. These, whirling round in the air, thrust the aeroplane forward in the same way as does the propeller of a ship.

The weight carrying effect with such an aeroplane is obtained from the two big main planes. These, set one above the other, are kept apart by wooden supports, which are held rigidly in their place by tension wires. One of the first things that an observer notes regarding the lifting-planes of the machine is that they have a curve upon them. The front edge tilts down a little, and toward the rear the planes curve down slightly also. Many people ask, "Why?"

The answer is simple. The plane copies in its curve the wing of a bird. It was Lilienthal, a German engineer, who was making experiments with gliding aeroplanes as long ago as 1890, who discovered that the bird-wing curve exercised a far greater "lift" when thrust thru the air than did a flat plane surface. So nowadays all the planes of aeroplanes are replicas of Nature's curve on the bird's wing.

There is no difficulty in explaining how the curve on a plane acts when the aeroplane is in flight. You must remember that the plane moves thru the air, when the machine is in motion, at a speed of more than forty miles an hour. The air first strikes the dipping "nose," as it is called, of the plane. Some of it immediately rushes up under the curve on the lower side of the plane, and sweeps away in a curving stream toward the rear edge of the surface. The effect is that of gripping the air during the period that it passes under the plane.

What happens may be better understood, perhaps, if I say that the air is thrust down by the curve of the plane. This action allows the plane to derive an appreciable "lift" out of the air which it displaces. The air that passes over the top side of the plane is made to do useful work also. Its tendency is to move straight back from the front edge of the plane. It does not follow the downward curve toward the rear edge of the plane. Thus, as the air passes straight away, a partial vacuum is created along the dipping down edge of the plane, and this exercises a distinct upward pull. Therefore, the plane is pushed from below, and pulled from above. This dual effect makes the bird-wing curve infinitely more effective than a flat plane would be.

By the adoption of this curved plane the builders of aeroplanes know that, if they employ a machine with a certain number of square feet of surface, and thrust it thru the air at a certain speed, they will be able to lift into the air a certain weight. I have now described how the two main supporting planes of a biplane do their work. But this is not all.

The question of balance and control enters largely into the flying problem. Therefore, you find, set out upon wooden booms at the rear of the biplane, a tail composed of two small planes, placed one above the other. These two planes tend to balance the aeroplane when in flight in the same way as does the tail of a bird. Then one comes to the point as to how the aeroplane is to be made to rise or fall, turn from side to side, or balance itself when it shows a tendency to tip sideways in the air.

Midway between the two small tail-planes one finds a vertical plane which resembles the rudder of a ship. This plane, in fact, acts for the aeroplane in the same way as does the rudder of a vessel.

Now comes the question of making the aeroplane rise or fall. To do this one finds set out in front of the main-planes, on wooden outriggers, a small horizontal plane, which can be moved up or down at the will of the pilot. Very often this front elevating plane is coupled up with a smaller one, which is fixed at the rear of the tail-planes, so as to exercise a greater lifting influence.

The only other controlling device is represented by the "ailerons." These are fixed at the rear edges of the main-planes, and work up and down on hinges. Their object is to correct any loss of lateral stability upon the machine; or, to put it more simply, they counteract any sideway falling movement when in flight. How they act may thus be described: When the aeroplane is struck down by a gust of wind, and tilts over on one side, the pilot draws down the "ailerons" on the side of the machine which is deprest. The wind, acting upon the "ailerons," pushes the machine back again upon an even keel. Thus you have outlined the controlling mechanism of the biplane.

Now comes the question of flying such

a machine. The pilot takes his seat on the front edge of the lower main-plane, exactly in its center. To his left hand are the switches which control the engine. To his right hand is a lever. He places his feet against a rod, which moves to and fro upon a central hinge. Mechanics start the engine by swinging round the big propeller. Then, when the motor has started, he accelerates it by moving a switch until it is turning the propeller at its maximum speed.

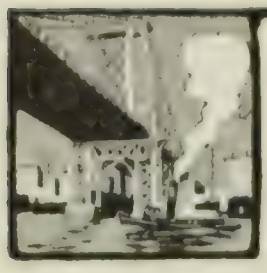
Until he is quite ready to start, his mechanics hold back the aeroplane by gripping the tail-booms. After listening for a moment to the engine, and making certain that it is running well, the airman holds up his hand. This is a signal to the mechanics to release their hold upon the machine. When they do this the aeroplane starts off across the ground, running upon the wheels which form part of its landing chassis.

The pilot allows it to gather speed for a few seconds; then he draws back toward him the lever which he is holding in his right hand. This has the effect of tilting upward a little the elevating plane which is set out in front of the machine. The effect of this is to raise upward the whole machine. The rush of air under the main-planes intensifies their "lift," and the wheels of the machine leave the ground, and it begins to soar upward. The pilot still holds the elevating plane at a slight upward angle, until the aeroplane has "climbed" sufficiently high. Then he brings it gently back to a level position again, and the machine flies straight ahead.

When gusts of wind assail the machine, and it tilts to one side or the other, he corrects this by sideway movements of the same lever which controls the elevating plane. This lever is coupled up to the "ailerons," and actuates them.

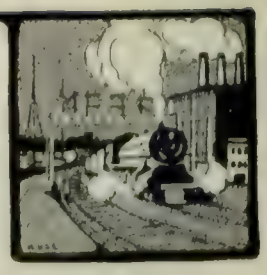
When the time comes to make a turn in the air, the pilot moves the rod against which his feet are resting, and swings the rudder over either to the right or left. In this way the machine is flown. When a descent is necessary, the airman points his machine earthward by tilting downward the elevating plane. Then as the machine comes gliding toward the ground he usually stops his engine, and makes what is known as a "vol plane." In this case the machine glides downward with its own momentum. Just before he touches the earth the pilot draws back his elevating plane a little and brings the aeroplane upon an even keel, so that its wheels touch quite lightly.

This description may, perhaps, make flying appear very easy. So it is, as a matter of fact, when the weather conditions are favorable. Many men learn to pilot an aeroplane after only two or three short lessons. In some cases, indeed, it has been found easier to fly an aeroplane than to learn to drive a motor car.



But a very great deal of skill is required to pilot a machine when the wind is gusty. Then the aero swings and rolls about in the air, sometimes in a very alarming way. Incessant watchfulness is necessary to keep it upon an even keel, and none but experienced flyers care to ascend unless the weather conditions are good.

Another contingency which calls for skill is when the engine sometimes stops accidentally in the air.



Perhaps when his motor fails him, the pilot is flying swiftly across country. In such a case, he has to descend in a "vol plane," and pick out a suitable landing-spot as he comes gliding down to earth. To keep one's head at such a moment, and make a safe descent, means the exercise of a great deal of skill, and this only comes by experience.

Boston, Mass.

# Private Control of Property

BY JAMES MAC KAYE

Author of "The Economy of Happiness," "The Politic of Utility."

PROPERLY to discuss the question of the degree in which the private control of property promotes the welfare of society requires at the outset a division of private property into two classes:

(1) That utilized for private purposes, such as dwellings, clothes and food, comprising all private utilities.

(2) That not utilized for private purposes, such as railroads, factories, mines, and lands used for public or social purposes. The portion of this kind of property which is utilized at all comprises all public utilities.

That the first class of property is within the proper limits of private control will probably not be disputed. It is not apparent how ownership by a family of the objects actually used or consumed by that family itself, for its own purposes, can be opposed to the welfare of society. So well recognized is the utility of private control of this class of property that to adduce reasons therefor would be superfluous.

That the second class of property is within the proper limits of private control will be disputed by many, and to suggest some of the ways in which the private ownership of public utilities is opposed to the welfare of society is the main purpose of this paper.

It must be admitted that such ownership is generally of benefit to the possessing individual or family since it enables him or them to obtain wealth without exertion. Indeed, except in cases in which benevolence enters as a motive, the sole object that any private individual or family can have in owning property not used for his or its own private purposes is to receive a reward for such ownership. Any one holding legal title to factories, mines, railroads or other property used for public purposes can obtain a return, not because they do anything but because they own something. The return for ownership is called profit, that for service is called wages or salary, and this dual mode of award, which is inseparable from the economic system under which we live, is due entirely to the private ownership of property which is not privately used. The institution by virtue of which ownership commands an award may be called the institution of profit

It will, I think, be generally admitted that the welfare of society is not promoted by requiring it to give something for nothing—to pay tribute where no essential service is returned—for ownership is not an essential service, and all the ingenuity of current economic apologetics to make it appear such cannot disguise the fact.

Indeed it is an elementary commonplace of economics that the only essentials of production are land, labor, and capital. Now two of these essentials, viz., land and capital, never receive any return or reward for the service they render. Being inanimate objects they are not in a position to receive rewards. But under the present system two acknowledged non-essentials of production, viz., land holders and capital holders, are delegated to receive the reward for them, their subsistence being drawn from a mere legal relationship. Thus the laborer, whether manual or mental, is rewarded for performing what economists admit is an essential service in production, and all others are rewarded for what they equally admit is not an essential service.

Few are the individuals who would not be willing to render the service implied in ownership. Inquire of the most confirmed misanthrope whether he would accept ownership of property which the public uses, and will any one claim that his aversion to the service of his fellow

men would constrain him to decline? Indeed it is obviously absurd to assert that any individual renders society an essential service by kindly consenting to own property for it. The Army and Navy of the United States use property owned by no private individual or family. If private ownership of property used for public purposes will serve the interests of the community why does not the nation insist that the government shall seek out one or more individuals skilled in the art of owning such property and urge upon them the ownership of these orphaned hereditaments?

It is true that if profit-yielding property were so distributed among the workers of a community that each received as a tribute to his ownership the same amount which the ownership vested in others compelled him to contribute to them, the institution of profit would become innocuous—but it would remain ridiculous. Each worker would receive just what he would receive if the institution did not exist. His compensation would be the same only he would have two names for it instead of one. He could call part of it wages and part of it profit, and it would make no difference to him whether it was 90 per cent. profit and 10 per cent. wages or vice versa. By whatever name designated, its only valuable quality, viz., its purchasing power, would not be altered. In other words the average worker cannot possibly gain by the institution of profit even in the most favorable case imaginable he can only just come out even—but he can easily lose. This institution can only benefit a class. It can never benefit society, for the simple reason that society as a whole cannot get something for nothing. Every one cannot go into owning things for a living—some one must do the work of the world. An owning class cannot live alone. It requires a doing class to live upon.

Moreover the owning class, strictly speaking, comprising those who gain by the institution of profit more than they lose by it, is always a minority. Ownership as a vocation is reserved for the few. The vocation of the many must be service, and under our institutions it becomes largely service in the interests of the few.

Not only is ownership essentially a minority vocation—it is the vocation of a proportionately diminishing minority. Under a system where money can "earn" money, and the increment added to wealth is in proportion to the amount of that wealth, property becomes self-accumulating. The more a man has the more he gets. The power he possesses to exact profit—tribute—is cumulative. His wealth increases automatically, and the more commanding his position as a profit-exacter the less the chance of those from whom his profit is exacted to attain a like position.

To reconcile the wage-earner to the tax laid upon him by the institution of profit, he is reminded that he can become a profit-taker himself—that the same institution which permits others to levy tribute upon him permits him to turn to levy tribute upon others. All he needs is to be thrifty. Let him consume less and save more. By depositing his surplus in the savings bank his money will earn him interest at the rate of three or four per cent. per annum without effort on his part. He can draw from the bank three or four dollars a year for every hundred he has deposited, without diminishing his fund. Thus will he realize the lofty ideal of the profit system—the attainment of wealth without effort—he will become a capitalist and receive something for nothing.

Clearly to comprehend the fallacy of this "saving" or "thrift" argument consider the figures given by Charles B. Spahr in his book, "The Present Distribution of Wealth in the U. S." From the Statistics of the Eleventh Census he estimates that in the year 1890, 40 per cent. of the wealth produced in the United States was distributed as an award to ownership. This percentage is doubtless an underestimate for 1910, considering the improvements in the machinery of profit-taking devised in the last twenty years. Nevertheless, to be on the safe side, let us assume it to be correct. So assuming, we find that a wage-earner to-day receiving four per cent. interest must have a fund in the savings bank equal to his entire wage for a period of sixteen and two-thirds years in order that the tribute paid to him as a petty capitalist may compensate for the trib-

ute paid by him to other capitalists. A worker receiving a wage of $1000 a year, for example, would require a savings fund of $10,000 to bring him out just even with the profit system. Assuming the worker to accumulate such a fund in a lifetime how will his family fare during the process? We may leave the question to the philanthropists who would reconcile the worker to the profit system by the plea that every one can live by ownership if they will only be thrifty and saving enough.

But we do not need to speculate upon the way in which the private ownership of public utilities affects the welfare of society. All we need do is to observe it. It is hardly necessary to show that in theory an institution which provides a means of rendering wealth self-accumulating will result in great inequalities in its distribution, and make the owning class into a minority—when we can so easily see that in practice it has this effect.

Time will not permit discussion of the various ways in which the great inequalities of wealth caused by the profit system operate against the welfare of society, but so far as the system affects private property, it is emphatically injurious, because to permit the private ownership of property *not* properly controllable by private parties operates to unduly and unjustly diminish the amount of property which *is* properly controllable by private parties. The many consume too little that the few may consume too much. Private ownership of public utilities diminishes private ownership of private utilities.

The proper limitation of private property is deducible from the simple rule of democracy. As applied to the control of property this rule requires that the social unit which uses a given property shall control its use—and without ownership control is generally chimerical. Thus property used by and for a family should be owned by that family; property used by and for a city should be owned by that city; property used by and for a nation should be owned by that nation; and property used by and for society should be owned by society.

The rule of democracy is the only rule of public policy thus far discovered which will prevent one social unit from preying upon others. Consistently applied it is as successful in guarding society against the aggression of the individual as it is in guarding the individual against the aggression of society. At present not only the danger, but the realization, of the former type of aggression is far more in evidence than of the latter type. In our country to-day men are oppressed not by the state but by individuals, and the private ownership of public utilities, which is violative of the rule of democracy, is the instrument of their oppression.

If the private ownership of property to which private families are justly entitled is to attain its legitimate limits, the private ownership of property to which private families are not justly entitled must be abolished. Taxation without representation is tyranny whether the tax is imposed by a government or by a private individual. If our nation continues to acquiesce in taxation thus privately imposed it will prove the sons of the republic unworthy of its sires. Submission to a king industrial is as ignoble as submission to a king political. A people who refused to yield tribute to the House of Hanover should refuse to yield it to the House of Morgan.

BOSTON, MASS.

# Chaperoning a Beauty in Spain

BY ESTELLE DYKE

[The author of the following article was formerly instructor in Leland Stanford, Jr., University. She is now resident in Spain, where the following incidents took place.—EDITOR.]

"ELOISA might marry any day," said Doña Ana Maria, "and of course our financial condition would be improved. But if God gives us health we shall not starve meanwhile."

"Her *pretendiente* is a very good man," added crippled Aunt Isabel, looking up from her interminable embroidery, "but she thinks he is too old."

Eloisa's skilful fingers flew among the bobbins of her lace pillow as she explained, "He is certainly good, but he earns only $70 a month, and has his mother and sister to support. Do you not think, Doña Estella, that if I marry an old person there should be real advantages to compensate?"

"Assuredly," I replied; "how old is your *pretendiente?*"

"He is twenty-eight, twelve years older than I."

"Oh, you are quite right, Eloisa," I agreed, without a smile. "By the way, I am going to the Prado Gallery this afternoon. I suppose you have seen it many times."

"Never," said Eloisa, "and we have been in Madrid more than a year!"

"I am always so busy," explained her mother. "We can never stop work. If Canalejas carries his law of associations we shall not have to compete with the nuns, who pay nothing for their living, and we can afford more leisure."

"Poor Eloisa goes nowhere," said Aunt Isabel sadly. "I cannot walk and, of course, she cannot go alone. Yet the child is always as cheerful and good as an angel."

"You shall see the gallery with me," I said, and Eloisa joyously dropped her lace-making and flew to get ready, while I meditated resentfully on the absurd Spanish etiquet which forbids unmarried women to appear on the street alone, and recalled the maiden of thirty summers in Seville who had never seen Murillo's masterpieces because "Mamma did not like art."

Eloisa was a very agreeable and sympathetic companion, with an innate perception of the beautiful, and the afternoon passed happily. As usual, I spent my last half hour in the salon of Velazquez. Always hypnotized by "Las Lanzas," I had begun to see the horses champing their bits and pawing the ground, while the weary soldiers shifted their heavy weapons, or turned to exchange a word with their neighbors. Suddenly I became conscious that the Marquis of Villafranca had stepped outside the frame. I pulled myself back into reality with sudden fright. "I am getting daft over this picture," I thought. But while one marquis was properly posed within the frame, another stood outside gazing fixedly at us.

"Eloisa, do you see that remarkable likeness—the same handsome face, the same proud figure, the same expression of surprise?"

Eloisa nodded assent, with cheeks even rosier than usual, for she was quite conscious of his unashamed attentions.

That evening, as Eloisa sat among the flowers of her balcony and I behind my persiana, exchanging comments on the day, the Marquis of Villafranca, as we chose to call him, strolled down the street below us. In fact, his entire evening was devoted to this pastime. Frequently he paused opposite us, admiring the flowers, but Eloisa fanned steadily, unconscious of his existence, or leaned over the balcony to talk across the street with her friend, Dolores. Mamma and Aunt Isabel were in a high state of excitement behind their persiana, for we had told them the story.

The next morning the portera brought up a letter properly addressed to Srta. Da Eloisa Garcia de la Vega, which we all shared. It read:

*"Very distinguished and highly respected Señorita.*

"When I met the glance of your lustrous eyes yesterday, I knew that beauty and inter-

est hitherto unknown had entered my life. Last night when I saw you among your flowers, yourself the fairest flower of all, I felt that to leave Madrid without speaking would be intolerable misery. Will you not exchange postal cards with me?

"Your most respectful and devoted servant, who kisses your feet,

"RAFAEL GOMEZ DE GONDOZA."

"61 Canovas."

"What do you think of the letter Doña Estella?" asked Aunt Isabel.

"It is a very sincere letter," I replied. "But he evidently does not live in Madrid, as he speaks of leaving."

"How old should you think him?" inquired mamma.

"About twenty-one."

"That is what I believe," agreed Eloisa. "But," she added with deep anxiety, "I have no postal cards."

"I am going to Calle Mayor. You may come with me and select one," I said.

Eloisa, with great tact, sent a copy of "Las Lanzas," receiving in return "Venus at Vulcan's Forge," with the comment:

"When my eyes fell upon you, I experienced the same amazement as Vulcan's smiths, that the world held so beautiful a vision."

That night the balcony, the flowers and Eloisa were all radiant. Rafael's evening was devoted to strolling up and down the street opposite our flat. Apart from the language of the eyes no words were exchanged, but when Eloisa retired she dropped her loveliest rose from the balcony. As in the days of chivalry, Rafael received it with a graceful bow, his hand on his adoring heart, and walked away with the rose held to his lips.

How Eloisa sang and laughed and bubbled over with joy at her lace-making the next morning! Until the postman came! For he brought a letter from Rafael, stating that the Fourth Regiment, in which he was a lieutenant, had been ordered to Saragossa, but that he should obtain a leave of absence at the earliest opportunity. No further message arrived.

Eloisa's disappointment, shared by all the family, prompted me to offer her such mild distraction as I sought for myself. A morning in the National Library left her so cheerful that I tried to discover what curative agency she had found in Becquer's tales. But she could give no intelligible account of her literary acquisition.

At dusk appeared opposite the balcony a slender anæmic youth of some eighteen summers, clad in gray, and the following morning the portera brought Eloisa another letter:

"*Very distinguished and highly respected Señorita:*

"I know that you read in my eyes, yesterday morning in the library, the deep love and admiration I feel for you, which has completely blotted out all the previous loves of my life. In your eyes, too, I read that you did not find me unpleasing.

"I am the son of a Government official, and while not yet launched on a career, I expect to win distinction as a poet.

"I am a youth of high ideals, a loving heart, noble character, and some genius. Does this description please you? If so, kindly exchange postal cards.

"My dreams are all of thee.
I live, for in life *thou* art.
I sigh, that my breath may fan thy cheek.
With longing for thee throbs my heart.
I suffer, but pain is divine, borne for thee,
And I rejoice, in the silence, apart.

"Your adoring and most respectful servant, who kisses your feet.

"MIGUEL ALVARO DE LEON.

"Lista de Correo, Cedula 10."

"What impertinence! I never looked at him in the library!" exclaimed Eloisa.

"Did he follow us home yesterday?" I asked, with a suspicion that Becquer's tales had not received the undivided attention of my companion.

"Yes, and he gave the portera a peseta to tell him my name. I shall not acknowledge this letter." And with no kind word or glance to reward his devotion, the unhappy youth of some genius bore his divine pain for many solitary evenings opposite Eloisa's balcony.

Two weeks after Rafael's departure a letter arrived. The stationery was adorned with a coat of arms and the five-pointed crown of the marquis. He wrote:

"*Adorable and highly respected Señorita:*

"I am allowed two days of absence from my regiment. May I not have the inestimable privilege of talking with you Saturday evening? I shall be on Alcalá, at the Prado, at eight o'clock, and if I see approaching the most beautiful girl in Madrid I shall hardly be able to contain my joy. Do not fear to come alone, for I respect you as I respect the saints in heaven."

Doña Ana Maria dropped her embroidery, donned her shawl and man-

tilla, and sallied forth without a word of explanation. An hour later she returned, her slender form trembling with excitement. "I have learned the truth about Rafael Gomez de Gondoza," she announced. "He is the son of the Marquesa of Villafranca—the lineal descendant of the Marquis in Velazquez's picture!"

Aunt Isabel voiced the general consternation when she exclaimed, "But his mother never will allow him to marry Eloisa!"

"Our family is older than hers, and much more noble," replied Doña Ana Maria, hotly. "If we had the money to claim our titles, my son, Fernando, would be Marquis of Espinola, and my daughter, Eloisa, Countess of Valparaiso. But meantime I have not enough money to buy a pair of gloves to go with Eloisa Saturday evening. What is to be done?"

"Her brother?" I suggested. But brother Fernando, tho very kind and affectionate, sharing generously his meager salary with the family, was absolutely blind to Eloisa's social advancement.

"And how would strangers know that he really is her brother?" asked Doña Ana Maria.

"Would I do as chaperone?" I asked, and the joyous acclaim convinced me that my offer was exactly what was expected.

I could not refrain from asking, "Why did Rafael suggest Eloisa's coming alone?" but my only answer was "Ah, why?"

If Rafael did not expect a chaperone he concealed his disappointment bravely, and we spent the evening like old friends, strolling to the Recreo de Castellaña, partaking of cakes and coffee, listening to the music and gossiping about life in army and court circles. At eleven o'clock we walked slowly home thru leafy avenues where the nightingales were singing cantatas of the springtime. Rafael told Eloisa frankly that his mother had formed matrimonial plans for him. "But I am not bound, and in two years I shall be twenty three and my own master in the eyes of the law. Meanwhile I shall persuade my mother. Will you wait for me?"

Eloisa would wait, but she would never enter any family unwilling to receive her.

They parted rather sadly at the porteria, and Eloisa wept as she told the story of the evening to mamma and Aunt Isabel. The next morning she did not appear in her balcony, and the three small boys who played at bull fights below inquired of me if she were ill. "How beautiful is Eloisa!" exclaimed eight-year-old Emilio. After a lengthy discussion the boys disappeared, bearing with them the horns, spear and cape which made "the toros" realistic. At noon the portera brought Eloisa a joint letter from the small toreros, signed by their "professional" nicknames:

*"Most distinguished and beautiful Señorita:*

"The morning that you do not appear in your balcony the sun fails to shine.

"Our sports lose their interest when your precious face does not smile down at us.

"You are lovely and good enough to be with the angels in heaven.

"Your adoring servants, who kiss your feet,

"Emilio (Bombita).
"Ricardo (Gallito).
"Alonso (Machaquito)."

This tribute cheered Eloisa perceptibly, and when I suggested a trip to Getafe to see the arrival of the airships she entered into the plan with enthusiasm.

The airships failed to appear, and 90,000 bored Madrileños sought diversion under the trees of Getafe. The situation soon became impossible for me, altho Eloisa sustained it with fortitude, fanning with much composure. Groups of soldiers followed us commenting on her beauty. Students passed and repassed, bending low to look into her face, exclaiming, "What divine color! What glorious eyes!" One handsome but odious man of forty-five we could not elude. We tried to hide from him in a garden, but finally were obliged to pass him, when he bent his head to Eloisa's level declaring, "Your beauty draws me like a magnet. I will follow you forever!"

"In my country," I began, indignantly, "your brother or your sweetheart would be with you, to knock down a wretch like that!" And thereupon we came full upon brother Fernando, with two friends. He seemed rejoiced at the meeting, declaring that he had sought us for hours. We found shady seats on the

bank of an irrigating ditch, and the poet devoted himself to Eloisa while brother Fernando and the artist one on either side proceeded to convince me that Greek civilization was much higher than Christian.

The Spanish are born orators, delighting to "make use of words," as they call discourse, and an hour passed very pleasantly for us all. Finally shrieks of laughter drew our attention to the opposite side of the ditch. A tipsy individual was mimicking my orators with great success, holding to a tree with one arm and gesticulating grandiloquently with the other. Brother Fernando lost all interest in the Greeks, and proposed visiting the village, and we moved on.

A biplane arrived just at dusk. It was worth the wait, but 90,000 Madrileños then wished to return home. Clearly some would not reach home before morning. I was not surprised when the artist and the poet melted away in the crowd. Both were barred as *pretendientes* by poverty. But I was amazed when brother Fernando transparently lost himself, and left us to fight our way alone. When we reached home at eleven o'clock we found him "mad with anxiety," two hours in advance of us.

But Eloisa's elderly admirer had not lost sight of us, and the following evening the old roué and the budding genius shared their vigil opposite the balcony. A letter of declaration was promptly answered by Eloisa, who said that her mother thought her too young to correspond with the writer.

"What matters your mother's opinion if you love me?" he replied. But Eloisa did not love him. In fact we all disliked and feared him, but he persisted in his unwelcome attentions.

One evening, caring for her flowers, Eloisa thoughtlessly threw some water over the balcony, not seeing her *pretendiente,* who was lying in wait for her, and who raised his face at the sound of her footsteps just in time to receive a thoro drenching. This incident appeared to cool his ardor, and we saw him no more.

During the last two months of my stay in Madrid I took Eloisa with me on many little excursions. Sometimes our carfare was paid by mysterious unknowns who never divulged their identity, tho they probably appeared later, opposite the balcony. The portera waxed prosperous with propinas from "followers." Poor Miguel was rarely solitary in his evening strolls down our street. The naive methods familiar among American youth were employed to draw the chaperone into conversation. "Excuse me, but does this car go to the Puerta del Sol?" the traveler next us would inquire, blind to the glaring signs announcing its destination. Once a desperate student stopped me in the street. Mil perdones! Could I inform him if the beautiful señorita was already promised? It was a matter of life and death with him.

All this time no letter from Rafael. We were all losing faith in his sincerity. But in Spain life continually repeats the dear old romances of our childhood.

One day the newspapers announced that the only daughter of the Marquesa of Villafranca had entered a convent—because of an unhappy love affair, it was whispered.

The next week a lady visited our little flat to ask Eloisa if she would take her order for lace, explaining that a friend of the family had sent her. Eloisa was even more charming than usual in her eagerness to oblige the lady, who forgot to leave her name. Doña Ana Maria maintained a very stately and formal attitude thruout the interview. No sooner had she closed the door behind the visitor, however, than she burst into tears, sobbing, "Eloisa, all is coming right. It is Rafael's mother! It is the Marquesa of Villafranca!"

The next Sunday evening Eloisa, among her flowers, gave a little cry of joy. Rafael was below. With a truly Spanish scorn of eavesdroppers he called "Eloisa, my mother consents!"

As he rushed up the narrow stairway a sad gray shadow faded "into the silence apart."

I set out for Barcelona the next day. Eloisa, dimpling with happiness, refused to say a real goodby, "For when I am a Marquesa, Doña Estella, you will pay me a long visit, and, if God wills, we shall make the journey to Getafe in my automobile."

MADRID, SPAIN.

# The Carnegie Endowment Conference on War at Berne

BY PAUL S. REINSCH

[Our readers will learn from the following article what are the first fruits of the great Carnegie fund of ten million dollars for the promotion of Peace in the world, Professor Reinsch having attended the first international conference. He is Professor of Political Economy in the University of Wisconsin, and has written much on questions of legislation and is known as an authority to our readers. During the term for October to April he will be lecturing as Exchange Professor in the University of Berlin.—EDITOR.]

THE conference which was held at Berne in August inaugurated the scientific work in the study of warfare and international relations which is to be carried on under the auspices of the Carnegie Endowment for International Peace. Seventeen economists and publicists gathered at the invitation of the trustees of the Endowment for the purpose of discussing the methods and subjects of investigation and to determine on a program of researches to be undertaken in the near future. The members of the conference were Professors von Boehm-Bawerk and von Philippovich, of Austria, the former ex-Minister of Finance; Professors L. Brentano and Th. Schiemann, of Germany; M. Paul Leroy-Beaulieu and M. Charles Gide, of France; Signor Luzzati, until recently Premier of Italy, and Professor Pantaleoni; Mr. Hirst and Mr. Paish, of England (Mr. Hobhouse also being present for a short time); Senator La Fontaine, of Belgium; Professor Greven, of Holland; Professor Westergaard, of Denmark; M. Borel, of Switzerland; and Professor John B. Clark, the chairman of the section on Economics and History, and Professor Reinsch, of the United States. The conference met at the Bernerhof and at the University of Berne, and spent two weeks in the discussion of its work, both in formal meetings and in informal groups. Professors von Philippovich and Borel acted as chairmen of the conference successively.

Tho so many countries were represented, and tho a great diversity of opinions were held by the members of the conference, it proceeded with its work in a spirit of harmony and mutual understanding. The great opportunity afforded by the Endowment to undertake a comprehensive scientific survey of the whole field of war and international relations, both in history and in the economic life of the present, was appreciated by the members, and they were all bent on lending their counsel and assistance in order that so vast and important an undertaking should be begun and carried out in the broadest scientific spirit. While many difficult problems of method and scope of the investigations were encountered, the discussion had in the conference served to clear up many points and to suggest promising ways of approaching the subjects of inquiry.

The conference divided itself into three committees: one dealing with the causes and effects of warfare; the second with armaments; and the third with economic activities tending to bring about closer international relations. These committees elaborated detailed programs for research and study in their respective fields. It will be seen that this division not only includes studies relating to warfare and armaments, but also a comprehensive investigation of those economic and social forces which are tending to draw nations together more closely, and thus in a natural manner to eliminate war or to render its occurrence constantly less probable.

Without going into detail it may be said that the program adopted by the conference contemplates a study of modern warfare in all its social and economic effects, of the conditions and interests which are favorable to the creation of international hostility, and of the cost and the general effects of large armaments; as already indicated, the re

catches are also to include all those relations which are beginning to establish a complete solidarity of interest and harmony of activities throughout the world. The promise of a co-operative international study of war as a social phenomenon is readily apparent; hitherto war has been studied chiefly from the military point of view and in its political effects; a good deal of light will be shed on the history of human development by a comprehensive study of the social and economic causes and effects of modern wars. The mention of several other topics which had been selected by the conference will serve to indicate the nature and scope of the investigations which have been planned. The financial side of war is to be studied, including budgets for armaments and war loans. In connection with the latter the extent of war loans furnished by neutral countries is to be determined, together with the effects of the prevailing practice of allowing such loans to be made. The question of the "Open Door Policy" is to be made the subject of a comprehensive inquiry, as well as the effect of the protective policy on international relations and war. Investments in foreign countries, co-operation between financial centers, and the economic interdependence of different countries and regions of the world compose another interesting group of subjects. The complete program is to be published and may be obtained of the Carnegie Endowment at Washington. It must not be understood that subjects not specifically included in the program are not to be given attention; the program is only a preliminary statement to which new subjects may be added.

The undertaking here described is significant as being the first attempt to carry out broad scientific researches thru international co-operation. Scholars and publicists of all countries are to be invited to participate in this great work by contributing individual studies or by carrying on detailed investigations. International scientific societies have existed before, but never has a co-operative plan of research of such magnitude been attempted. That the trustees of the Endowment should have decided to pursue this method is proof of their desire to base the work of the Endowment on the broadest and safest foundation. The scientific study of war as a social phenomenon, and of all international relations affected by war, is a desirable preliminary and concomitant of any effort constructively to improve good feeling and bring about a mutual understanding among nations. To have begun this great enterprise by setting prominent scholars of the leading countries to work on a great co-operative undertaking certainly promises concrete and valuable results.

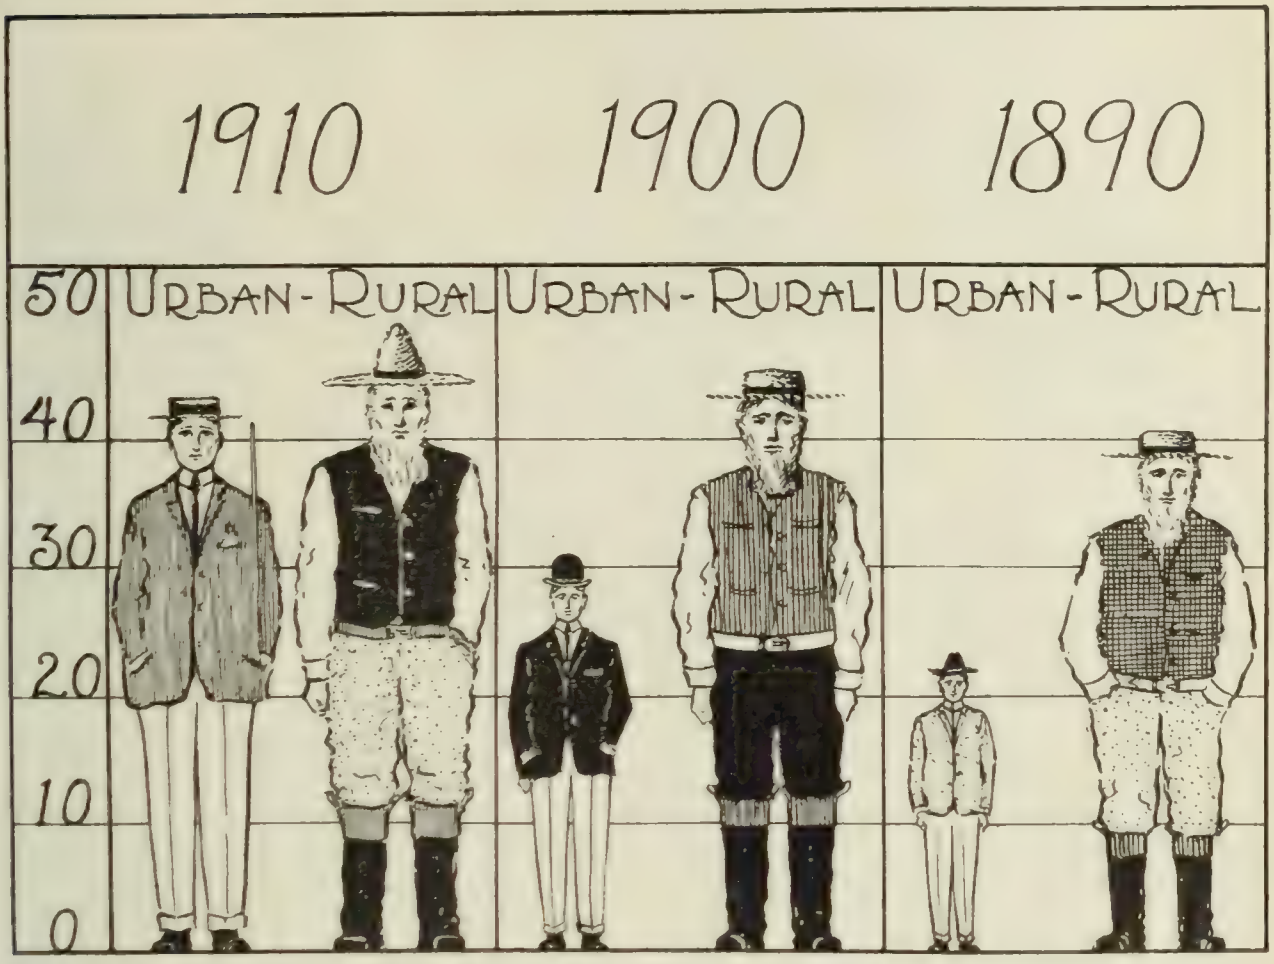
BERNE, SWITZERLAND.

# Pilate

BY EDITH CAMPBELL BABBITT

WHAT is Truth? he asked, and lo,
The Truth before him stood;
He might have touched it with his hands,
Have grasped it, if he would:
But crushed and torn and crowned with thorns,
How might such wonder be?
Its form was bent, its face was wan,
It seemed not Royalty.

Foes without were clamoring hard,
Its coward friends were hid;
Who dares to say he has not done
As that weak Roman did?
Judging Truth, we would release
Our Prisoner today;
Like Pilate, fear the multitude,
And sadly turn away.



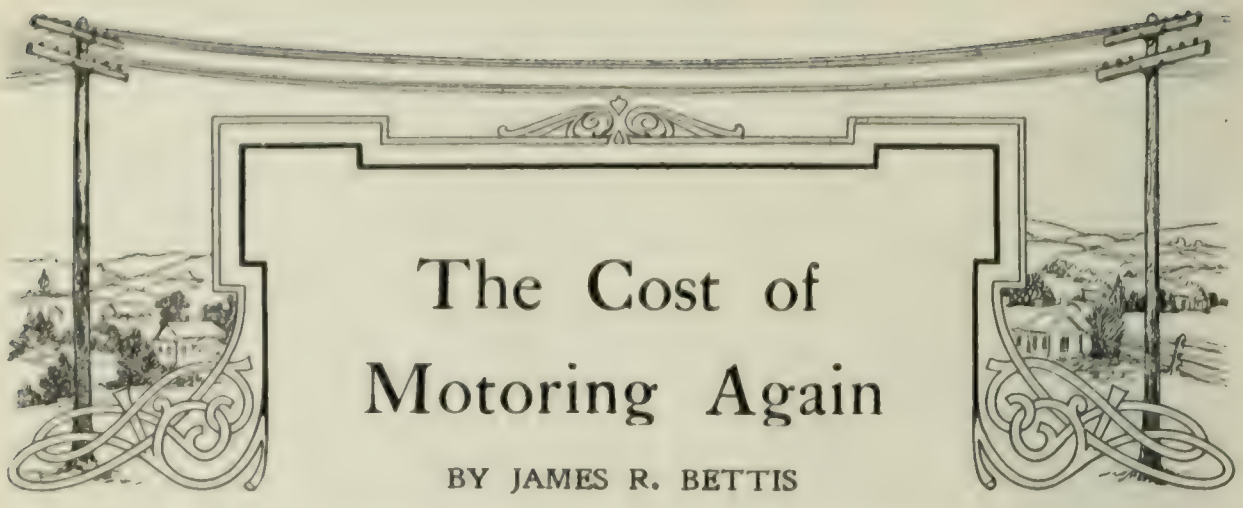
Thruout the passing centuries,
The Truth its sentence waits;
Its craven friends ignobly hid,
The rabble at the gates.
Finding no fault, we yield the cross
To Satan's shrieking bands;
Our silent God goes out to die,—
We, frightened, wash our hands.

BELOIT, WIS.

# Our Urban and Rural Growth

BY WILLIAM B. BAILEY, Ph.D.

ASSISTANT PROFESSOR OF POLITICAL ECONOMY IN YALE UNIVERSITY.



WE have heard so much of late about the movement "back to the soil," that it is of interest to note whether the tendency toward the more rapid increase of the cities has been checked during the past decade. The census figures upon this subject are now available, and show that 46.3 per cent. of the population are residents of urban communities, or places of over 2,500. In 1900, 40.5 per cent. were in urban communities; and in 1890, 36.1 per cent. The proportion living in rural districts has declined from 63.9 per cent. in 1890 to 53.7 per cent. in 1910. Unless some new force becomes operative it seems probable that the census of 1920 will show more than half of our population to be residents of urban communities.

In Rhode Island 96.7 per cent., and in Massachusetts 92.8 per cent., of the population is in cities and towns with a population of over 2,500. At the other extreme are North Dakota with 11 per cent. and Mississippi with 11.5 per cent. in places of this size. In fifteen States more than half of the population are in urban communities.

Since 1900 the increase in urban population for the entire country has been at the rate of 34.9 per cent., and of the rural, 11.1 per cent. In no State has the urban population failed to show an increase of over 10 per cent. since 1900, and in six States it was over 100 per cent., while in seven States there has been a decrease in the rural population. Montana and Wyoming are the only States in which the increase of the rural population during the past decade has been more rapid than that of the urban.

Apparently the effects of the application of steam and electricity to manufacture, transportation and communication and the attractiveness of city life have not yet spent their force.

NEW HAVEN, CONN.

# The Cost of Motoring Again

BY JAMES R. BETTIS

President of the Zouri Manufacturing Company.

YOUR recent writer upon "Motoring for People of Moderate Means" begins upon too expensive a basis, as it seems to me. when he starts out with a $2,000 automobile. There are plenty of cars running from $800 to $1,200 in cost which carry five passengers, and give perfectly satisfactory service. I have a $900 one—the second of the same make, operated by me for over four years. It has ample power to climb all the hills in the county on high gear, and on the level will go faster than I ever dare drive it. It runs about twenty miles to the gallon of gasoline, and one hundred miles to the quart of oil; mileage say, 70 miles a month, and for ten months of the year—January and February being too cold for enjoyable riding in this latitude. The ordinary expense for gasoline, oil, taxes, and odds and ends, will not exceed $10 per month, or a total for the first year of $100; one new set of tires, say $80; depreciation, 20 per cent.—$180—this I have found to be ample, by selling my first car after nearly four years of use, for one-third its first cost. I carry fire insurance, included in first item, at small cost. I have handled the car for over four years without injuring myself or any other person, and feel that I can afford to carry my own liability insurance. I have no charge for garage rent, because I have my own shelter for the car at home; nor for "house boy," for all the family is fond of the "May Bird," and finds the few minutes' work a day necessary to keep it clean a pleasant task. I attend to the mechanical adjustments and oiling, and run it myself, as the "Man of Moderate Means" should expect to do, and find it all a pleasure.

Here, then, is a total cost of $360 a year for about 7,000 miles travel; but I have an offset which must be considered. I live outside the metropolis, twelve miles from my place of business. Every time I drive in alone I save thirty cents car fare; when others ride with me this amount may be doubled. Altogether the cash so saved must amount to $80 to $100 a year—call it $90. Still further, the time spent on pleasure trips on Saturday and Sunday afternoons and holidays would generally be replaced by some more expensive form of amusement if the car were not available.

Thus we enjoy a healthful, useful and pleasant recreation—7,000 miles of it—at a net cost (barring accident) of about $270 for the first year, and a little more thereafter—about what it costs in my vicinity to keep a moderate horse and surrey, which would not yield one-fourth the amount of service. Is there any way in which the "Man of Moderate Means" could spend the same amount of money to greater advantage?

St. Louis, Mo.

# Literature

## The Danger Zone.

THIS is the apt title of a large volume by H. Charles Woods on the Turkish Empire and its offspring;[1] a very timely subject just now, in fact, a subject that is timely at all times. The annual spring "trouble in the Balkans" is indeed over and the Albanians have returned to their homes, each man with one pound Turkish in his pocket, but nobody would say that the Albanian question is settled, so the chapter devoted to that topic retains its interest. The terms of amnesty on which the Albanians who had taken refuge in Montenegro agreed to return do not settle the two points of greatest difficulty, religion and language. The events of the last three months make it probable that Mr. Woods was right in accusing Austria of stirring up sectarian and racial antagonism thru the Catholic priests in northern Albania. The quarrel over the schools results from the fact that the Young Turks, as part of their Mohammedan propaganda, insist upon the use of the Arabic characters, while the Albanians wish to use the Latin. Mr. Woods discusses the Cretan question at length, and he is also familiar from personal observation with the situation in Asia Minor. He describes in detail the massacre of the Armenian Christians at Adana which disgraced the new régime and explains its causes and results.

*Regilding the Crescent*[2] gives a more gossipy and cursory account of the rise of Young Turkey than the book just mentioned, but will for that very reason suit some readers better. The events of the revolution of 1908-9 and the establishment of constitutional government are narrated and the possibilities of the future are discussed, with especial reference to the commercial and industrial development of the empire. The author is familiar with the scenes he describes and has collected some interesting material, but he has added nothing to its value by his opinions or style.

*The Servian People*[3] is a comprehensive work. It is a study of all Servian peoples, including their history and civilization, literature, art and political transformations; it treats of all Servian lands, their geographical features, their flora and fauna; it comprises something about everything Servian from early times to the present day. It includes within its scope all the countries and provinces which are dominated by the Serb race, which means: Servia, Montenegro, Kassovo, Monastir and Scutary, Bosnia and Herzegovina, Dalmatia, Istria, Croatia, Slavonia, Banat and Batchka. The authors have performed a service of patriotism in the painstaking and profound researches they have made among the original historians of the Serb people and thru the historical state archives, and presenting them to English readers in these volumes.

The Servian is numerically the strongest of all the Balkan races, and owing to the natural strategic position occupied by the Kingdom of Servia it may yet have an important part to play in the ultimate adjustment of near Eastern questions. All observers know that some solution to the Balkan situation must sooner or later appear and many times in history have stranger things come to pass than the rise of the Serb people into a position of power and domination, in some future year. Ideals and principles for which the Serbs have long fought and bled are wholly in conformity with the highest standards of the most advanced nations of the world today. The basis of their theory of government lies in the undying central principle of civic and religious freedom and equality in government and justice as

[1] THE DANGER ZONE OF EUROPE. Changes and Problems in the Near East. By H. Charles Woods. Boston: Little, Brown & Co. $2.50.

[2] REGILDING THE CRESCENT. By F. G. Afflalo. Philadelphia: J. B. Lippincott Co. $3.

[3] THE SERVIAN PEOPLE. Two Vols. By Prince Lazarovich Hrebelianovich, with the collaboration of Princess Lazarovich Hrebelianovich. New York: Charles Scribner's Sons. $5 net.

the truest safeguards of the rights of the individual.

"Serb valor and heroism have been shown thru the centuries in their unceasing fight to preserve their liberties, first against Byzance, then the Turks on the East, and against the Germanic and Magyar nations on the north and west. In this unceasing battle of self-defense against great nations the Serbs have always been a handful against a host, a few against a far outnumbering enemy. What we fight for we love. The Serb has loved his home, his mother earth, with a peculiarly tender and undying affection. He will not give it up; it is saturated with his blood and purified by the sacred fire of his devotion. It has belonged to his race since the beginning of historic time. He believes that it is part of himself. . . . It is a moral characteristic remarked by many, his confidence in his final destiny, when what he has fought for, prayed for and sung will be attained."

*Through Savage Europe*,[4] by Mr. De Windt, is the account of a hasty journey largely among Serb people. After reading the foregoing history of the Servian people this book is an irritation. It is readable, it covers a lot of territory and tells a good deal about Servia in particular and several other lands in less detail. A more appropriate title, however, would be "Around Savage Europe," inasmuch as the author was frankly careful to make his journey thru "savage" countries by means of steamboats and railroad trains. Beginning at Cattaro the author sees a little of Montenegro, then comes up the Adriatic coast thru Dalmatia and into Herzegovina. Bosnia and Bulgaria each have a chapter, Servia several chapters, and finally he sees a little—a very little—of Russia. If one were anticipating spending a holiday in Dalmatia or the Balkans this book might be worth a hasty perusal, but it is frequently out of date and occasionally wrong in statements of fact.

*Turkey of the Ottomans*[5] forms a useful complement to any of the above mentioned, for it is chiefly concerned with quite a different field, that of the life of the people of today. None of the other volumes of this series, "Italy of the Italians," "Spain of the Spanish," etc., has a more interesting and difficult subject, because in no other country are so many different races and religions living commingled; Mohammedans, Christians and Hebrews to begin with, but each of these split up into various sects. This compact little book disentangles them as well as possible, and gives in a readable way a large amount of information on the social customs, religion, literature and work of the people in various grades of society.

**The Letters of Robert Louis Stevenson.** Edited by Sidney Colvin. A New Edition Rearranged in Four Volumes, with 150 New Letters. New York: Chas. Scribner's Sons. $4.

Perhaps the new letters will not greatly add to Stevenson's name as a correspondent, that is already writ large. We only know that they are very welcome, as is this rearrangement in the Biographical Edition of his works. Even here we have not all the letters which his friends preserved, tho we have added to those already in print in one volume or another some 150—including one to Simoneau, the restaurant keeper of Monterey, composed in the most ludicrous French imaginable. (It was a harmless delusion of Stevenson's, the notion that he was at home in French.) Interesting, all the same, are the Simoneau letters, both that in French and those in native English. Diverting is the poetical epistle to Henley, with its characteristically humorous petulance, dated from Hyères, 1884. The letter we refer to contains, among other stanzas, this complaint:

> "I had companions, I had friends,
> I had of whisky various blends.
> The whisky was all drunk; and lo!
> The friends were gone for evermo'!"

This eruption may be taken to be a complaint at Henley's remissness as a letter-writer. Interesting, too, is Stevenson's picture of himself in another letter written from Hyères, and addressed to a young art student named Trevor Haddon, who had asked him for his photograph:

"I have no photograph, just now," Stevenson replied; "but when I get one you shall have a copy. It will not be like me; sometimes I turn out a capital, fresh bank clerk, once I came out the image of Runjeet Singh; again the treacherous sun has fixed me in the character of a traveling evangelist. It is quite a lottery; but whatever the next venture proves to be, soldier, sailor, tinker, tailor, you

shall have a proof. Reciprocate. The truth is I have no appearance; a certain air of disreputability is the one constant character that my face presents: the rest change like water. But still I am lean and still disreputable."

Somewhat earlier this same Trevor Haddon had read his essay on Walt Whitman, and was "somewhat staggered by some things he found there," and had therefore written to the essayist for "further comment and counsel." Stevenson defends the thesis

"that it is better to have everything brought before one in books . . . when we are cool, and not warped by the sophistries of an instant passion. Life itself presents its problems with a terrible directness and at the very hour when we are least able to judge calmly."

Stevenson recommends chastity, "if you can make it convenient"—and his little sermon will certainly not recommend itself, by fervor, to the moralist. Yet we are glad to see the letters to Trevor Haddon printed here: perhaps there will in future be less twaddle about "Saint R. L. S.," and, as a result of the publishing of these *Letters*, there will obtain a truer impression of the whimsical, complex man that Stevenson was. Merely for what they are themselves, the letters are a constant delight—and would be, had their author never signed a novel or an essay in all his sickly life.

**The Beginnings of the American Revolution, Based on Contemporary Letters, Diaries, and Other Documents.** By Ellen Chase. New York: The Baker & Taylor Company, 3 vols. $7.50.

**The Dutch Republic and the American Revolution.** By Friedrich Edler. Baltimore: Johns Hopkins Press. $3

Here is an extremely minute account of Boston and its vicinity from the passage of the Stamp Act until the outbreak of the Revolution in 1775. As the title indicates, it devotes itself to the preliminaries. The reception of England's new fiscal policy, the ostracism of the stamp agents, the obstruction to the importation of tea, as well as the mutterings of resistance, the intrigue in Parliament, and the conflict of arms, are all described with an ostentatious parade of erudition. We know of no other work where there may be found a collection of exact citation of authority so large as there is embraced in the notes to these three volumes. The author has not let a guilty fact escape. The book suffers in its balance and continuity because of this determination to work into the text or the notes all the known facts. The proportion has been determined by the variety of source material rather than by the relative importance of the topics treated. To the day of Lexington and Concord, with the evening preceding, she devotes more than three hundred pages—a quarter of her space. Yet with all her learning the work adds little to our knowledge or understanding of the decade following the Peace of Paris. The general treatment of events is conventional and patriotic. There has been little study of the English colonial system, without which it is hardly worth while to approach the Revolution. The authentication of unimportant personal detail has been the central interest, and even here the treatment shows few traces of critical verification. Because of its intimacy of personal detail, the book is interesting. Its abundant quotations and footnotes give it distinct value as a work of reference. To the genealogist or the patriotic society interested in Massachusetts it will be invaluable. To the special student, on the other hand, Dr. Edler's thesis will have a superior interest. This, too, is a well documented study, but it has the advantage, not only of specialization, but of treating a field that remains little exploited.

**Memories of a Manager.** By Daniel Frohman. New York: Doubleday, Page & Co. $1.

Imagine a successful producer of plays sitting in his office and dictating, as occasion offers, a few paragraphs of reminiscence or of dramatic generalization—with reminiscence predominating. You have then a just idea of how Mr. Frohman turned out his *Memories*. His book is entertaining and instructive. Every one interested in the annals of the American stage will want to read it, in spite of its haphazard composition. Some of the reflections upon changes in the American public are decidedly illuminating. In one chapter the manager tells of having to "make a slight change in the relations of the parents" of one of Pinero's heroines. This was in 1887. "When I revived this play a few years

...as I produced it as originally written, and there was not a ripple of objection," says Mr. Frohman. The manager's remarks upon the construction of plays are no less interesting:

> Plays are built up. It is the business of everybody, from stage manager to scene shifter, just as it is that of the author, to help along the illusion. Dion Boucicault, who made more money out of his plays than any living author, said that, when he produced a play, he was always alive to suggestions from managers, actors or property men."

In anecdotes of players and authors, and in shrewd comment upon plays current and recent, this volume is one which the theatergoer will not overlook. It is nothing to what the layman imagines the manager *might* write: but the manager never does write up to those great expectations.

**Notes from the Life of an Ordinary Mortal.** Being a Record of Things Done, Seen and Heard at School, College and in the World during the Latter Half of the Nineteenth Century. By A. G. C. Liddell, C.B. New York: E. P. Dutton & Co. Pp. xiii, 370. $3.50.

This volume is quite out of the line of the common run of English autobiography, and is proof, if proof were needed, that achievement and distinction in public life or in art, science or literature are not always necessary to an entertaining book of reminiscences. Mr. Liddell was sixty years of age on the day on which he finished these notes, and his achievements up to that time were so little known to his countrymen that no place had been found for him in the English "Who's Who." But failure to achieve success at the bar does not detract from the story of Mr. Liddell's experiences on circuit. They are told with a frankness that will be appreciated by his readers; and these experiences, and his experiences as a revising barrister, will appeal to American lawyers who are interested in the procedure and customs of English civil and criminal courts. Mr. Liddell had privileges in both Houses, and his power of observation serves him well. The value of his *Notes*—well written and always characterized by a genial spirit and excellent taste—lies in the glimpses they afford of the social life of the English aristocratic and official classes.

**Individualism.** By Warner Fite, Ph.D. New York: Longmans, Green, & Co. $1.80.

It is a bit refreshing, in the midst of the clamors of social workers and the exponents of the common good, to read or hear something about the forsaken individual. While pulpit and platform thunder forth their arguments for the annihilation of all individualistic tendencies, we are inclined to suggest that it might be well to place a little value on the life of each and every individual. This Dr. Fite has done in his four lectures, and in making his plea he has succeeded admirably. At times he is a trifle high-browed and is tempted to assume the role of the pedant, but for the most part he keeps to the level of the general reader. His chief purpose is "to defend the cause of the individual" against the sophisms of those who are ever exaggerating the social even to the extent of self-sacrifice. He develops his theme from the Greek point of view—that of the every-day man as opposed to the meek and humble attitude of the orthodox Jew and Christian. In the ranks of the latter Dr. Fite's ideas will not at all pass muster, but to the individual who is striving to live, conscious of his actions, and is seeking the development of his higher self, they will be a source of much consolation.

**Glamourie.** A Romance of Paris. By William Samuel Johnson. New York: Harper & Bros. $1.20.

Introduction—or Dedication (two pages): *cher maître; tant pis.* Chapter one, page two: *Lanterne de Diogène; taxis; sapins; charettes; bicyclettes.* Page three: *enguelment; cocher; Tiens, voilà M'sieur le Maréchal! Salue le drapeau, camarade! Voilà! Mais n'est—ce pas merveilleux, m'sieurs et 'dames? marroniers; platanes; orangers; diabolos; diabolo; bourgeois; flâneurs; parterres; viola.*

This is not a conversation course; it is a little list which we started to make up of the French phrases and words found in this novel. But when we got as far as page 3, we wondered if it wasn't intended as a French book, with occasional English words and phrases (generally sounding to our ears like translations from the French); and that, together with the fact that space is worth something, is why we carry the list no farther. The scene of most of Mr. John-

son's chapters is Paris. Sir Michael Burke is the chief personage. He is one of those Irishmen who are constantly calling themselves Celts. There are excellent bits in the book about him—but the book bores us more than it amuses.

## Literary Notes

....Mrs. Maurice Hewlett, wife of the novelist, is the first woman in England to obtain an aviator's certificate.

....*The Ship of Coral*, by H. de Vere Stacpoole. (Duffield, $1.20.) A tale of buried treasure and Martinique romance with the destruction of St. Pierre as *deus ex machina*.

....*Patriotism. A Biological Study*, by A. G. F. Sproull, M. A. (Macmillan; $1), is not worth especial praise or blame. The author holds that patriotism determines a nation's destiny and can be defined as its "instinct for self-preservation."

....*World Organization. As Affected by the Nature of the Modern State.* By David Jayne Hill (Columbia University Press, $1.50). A learned and theoretical disquisition, invaluable to students of international law, statesmen and peace advocates.

....Mary F. Nixon-Roulet adds a new folklore reader to her collection in *Indian Folk Tales* (American Book Co., 40 cents). This is a welcome addition to the "Eclectic Readings." It is the North American Indians who furnish the romance for this volume.

....Rudolf Besier, author of "Don," produced last year at the New Theater, N. Y., publishes a lively comedy entitled *Lady Patricia* (Duffield), in which the old stage trick of the unseen listeners is repeatedly employed in a very effective and amusing way.

....A line of one of Milton's poems furnishes, with its allusion to autumn leaves, all that most Americans know about Vallombrosa, but Virginia W. Johnson's volume entitled *Summer Days at Vallombrosa* adds much to that slight store of knowledge (New York: Barnes). The traveler does not fail to retail a good deal of historical information.

In *Papers and Proceedings*, we have a record of the Fourth Annual Meeting of the Minnesota Academy of Social Sciences, edited by William A. Schaper (The Free Press Printing Co.). Besides official data, one finds here discussions by experts of such subjects as The Criminal Trial, Crime Preventives, Probation, Juvenile Courts, Minnesota's Water Supply, Employers' Liability, etc.

....From the New York State Department of Labor we received the 1909 *Annual Reports of Department Bureaus*, in two volumes. The first of these is devoted to Factory and Mercantile Inspection, and to Mediation and Arbitration. Volume two is entirely statistical. *The Tenth Annual Report* of the Commissioners of Labor for the twelve months ended September 30, 1910, comes to us with these volumes.

....In his *Random Recollections of an Old Political Reporter*, the author, William C. Hudson, has done more than gratify our curiosity for a glimpse behind the scenes of political conventions. He has provided some original material to history in making public his personal knowledge of the conduct of Blaine, Tilden, Cleveland, Arthur and other prominent men at critical moments in their lives (Cupples & Leon; $1.25).

....Mr. Howells is the author of a farce entitled *Parting Friends*, which comes to us from Harper & Brothers (50 cents). The scene is an ocean liner about to poke its way out thru the shipping toward the open sea, and the principal characters are two youthful lovers whose task it is to keep out of the way of the many admirers come to the pier to "see off" one of the pair. Mr. Howells's touch is as delicate as ever, and his little dialog has the sparkle of life.

....A new abridgment of Malory comes to us from Baker & Taylor, being entitled *Malory: King Arthur and His Knights*, edited by Henry Burrowes Lathrop ($1.50). The language of the melodious original is somewhat modernized, tho on occasion an awkward device is made use of, and the original word, presenting a difficulty to the modern reader, is followed by a bracketed synonym. The illustrations want distinction, and are muddy in reproduction. They are signed by Reginald Birch.

....We have long since praised the Centenary Edition of Dickens published in America by Charles Scribner's Sons in thirty-six volumes—of which we now receive the two entitled *Christmas Stories from "Household Words" and "All the Year Round"*. There are fifteen old fashioned illustrations, by various "eminent hands," and the whole enterprise is indeed pleasantly old-fashioned, the edition not trying to compete in insubstantial "convenience" with the India paper type of bookmaking.

...The autobiography of a dancer, a popular favorite who has tripped into success on her bare toes, would seem to be of frivolous content, light dialog and superficial gayety. But *A Big Horse to Ride*, by F. W. Dewing

(Macmillan, $1.50), is almost portentous in its solemnity. Rose Carson, dancer, takes herself, her art and life in general very seriously. Thru all the dangers of the dancer's career she keeps an instinct for goodness and a fidelity to high standards of conduct as well as to her art. As a novel, the book would gain power by condensation; it is often rambling, even incoherent at times; and the narrator is unpleasingly self-centered.

....In our issue of March 30 we commented upon the publication of a novel entitled, *Il est ressuscité*, by Charles Morice, and briefly analyzed it. An advance copy of the book now comes to us from the George H. Doran Co. ($1.20), in an English version by John N. Raphael. The English title is "The Reappearing." The translation seems to have been intelligently done, and the novel itself (which our readers will remember tells of Christ's return to earth—only to be rejected of men) is skillfully executed. The author is a Parisian critic, who does not fail to make his Paris a vivid setting for the satire; the translator is known to us as the English interpreter of "Marie-Claire." Mr. Coningsby Dawson contributes an enthusiastic introduction; he is persuaded that M. Morice "has woven the longing for an ethical awaking into a story at once so personal and so universal that it has revealed France to herself."

....An anecdote of poets. When Oscar Wilde was at the crest of his wave, writes Arthur Ransome, in the *Bookman*, Jean Moréas gave a dinner at which were present, besides Wilde and himself, Raynaud, La Tailhède and Du Plessys, disciples of Moréas, and Stuart Merrill, the symbolist. At dessert:

"Wilde bent his tall body toward Moréas and asked him to recite some verse. 'I never recite,' replied Moréas, 'but if you would like it, our friend Raynaud will recite us something.' Raynaud stood up, and, resting his redoubtable fists on the table, announced: 'Sonnet to Jean Moréas.' He received our applause, and then Wilde again pressed Moréas to recite. 'No; but our friend La Tailhède——.' In his turn La Tailhède rose, and, his eyeglass fixed, launched in a clear voice: 'Ode to Jean Moréas.' Wilde grew visibly unquiet at the worship paid to its chief by the Ecole Romane; none the less he continued by courtesy his insistence. 'Du Plessys, let us hear your latest verses,' commanded the master. Leaping up, Du Plessys trumpeted in vibrant tones: 'The Tomb of Jean Moréas.' Oscar Wilde, choked, conquered, routed, he who had silence about him in the salons of London, asked for his hat and coat and fled into the night."

For in these days he was used to having all the sugar himself

...."Why do you Americans not appreciate Thoreau?" asked an Irish painter and man of letters the other day. "He is one of your few great personalities—to say nothing of him as a nature-writer." At least we do reprint him. His *Week on the Concord and Merrimack Rivers* comes to us from Thomas Y. Crowell & Co. in the handsome edition illustrated from photographs by Clifton Johnson ($2).

....An exceedingly useful manual comes to us in volume eight of the *American Art Manual*, 1910-1911 (Florence N. Levy, Editor; American Fine Arts Building, 215 West Fifty-seventh street, New York). The special articles included deal with Art Schools in the United States, Design, Industrial Art, and the Teaching of the History of Art. Reports of 102 institutions show a total registration of 31,710 students of the arts in addition to a considerable number of students enrolled in the fine arts courses of the colleges and universities. This volume is interestingly illustrated, and has value as a work of reference.

....A correspondent of the New York *Times Review* writes from Paris that he has called upon Marguerite Audoux, author of "Marie-Claire," and that he wishes to deny most of the rumors that have flown ever since her novel was published, including that which would have her a "myth," or would represent her work as having been produced or edited by a man of letters. In the course of the interview, Mlle. Audoux told Mr. Sanborn that "Marie-Claire" was not, as has been stated, her first piece of literary work—nor even her first book.

"I had already written a number of short stories and succeeded in getting them printed in various quarters, particularly in The Cahiers du Nivernais, and this publication issued for me, 'Le Chaland de la Reine.'"

—a book now out of print, and much sought by collectors. Within a few months now her "Valserine" will be published both in French and English. This new novel is the tale of a smuggler's daughter.

....Interesting is the list of books selected for publication in New York point (for the blind) during 1911. These books will soon be available for circulation by the public libraries. Their cost varies from $1.50 to $17.50, according to the number of volumes (there are five in the case of Mr. DeMorgan's novel). Non-fiction first:

James Bryce: "The American Commonwealth"; Epictetus: "Selections"; W. T. Grenfell: "A Man's Faith"; G. H. Palmer: "Self Cultivation in English."

The list of fiction is no less interesting. It includes a volume of short stories by O. Henry, one of Miss Wiggin's "Penelope" books, Miss Abbott's "Molly-Make-Believe," books by James Lane Allen and J. M. Barrie, William DeMorgan's "Somehow Good," a detective novel of Anna Katharine Green's, and Anatole France's "Sylvestre Bonnard." There is also one play: Josephine Preston Peabody's "Piper." On the whole we find this a good list; altho, unless they already have it, the blind have a right to insist upon Conan Doyle before Anna Katharine Green; early, late and all the time.

....On September 20th occurs the fiftieth anniversary of Garibaldi's entrance into Rome. The Longmans hope to celebrate the occasion in bringing out the concluding volume of George Macaulay Trevelyan's biography of the Liberator.

....It is curious to see how quick the modern novelist is to catch a new motif. The Mexican revolution is barely over, or mayhap not yet over, and here is Mr. H. M. Kramer with a melodramatic romance served up with Mexican sauce, *The Rugged Way* (Lothrop; $1.35).

....Most novels of the Philippines are of the swashbuckler type or are devoted to the depiction of the lonesomeness of the American residents. In *Rainier of the Lost Frontier,* John M. Dean (Crowell; $1.20) has shown another and more inspiring side of life, the normal and educational uplift of the Y. M. C. A.

....Michel Revon, formerly a professor of the University of Tokyo, and now a lecturer at the Sorbonne, furnishes the critical and historical apparatus, as well as the French translations, which make up the scholarly and attractive volume entitled *Anthologie de la Littérature Japonaise des Origines au xxe siècle* (Paris: Ch. Delagrave; 3 francs 50).

....Thackeray's *English Humorists of the Eighteenth Century* is not a book that pleases the pedant, but it is a fine work for the young or the not very widely read to enjoy, and its appearance on the list of College Entrance Requirements is an excellent reason for its publication in "Standard English Classics" by Ginn & Co. (35 cents). Professor Stark Young is the editor.

....*The Drift,* by Marguerite M. Marshall (Appleton; $1.10), is written in a style that is unique and we hope will remain so. It is entirely composed of letters from a young woman to a married man, urging him to get a divorce and marry her, which he very sensibly declines to do, notwithstanding the great literary art she uses in appealing to every possible motive, good and bad, in order to win him.

The Burlington Library is a charming series of reprints published in America by Little, Brown & Co., at $1.25 per volume. In expensive as they are, the books which compose it are well printed and in every way attractive—including the color pictures generously provided by various English artists. The titles of the volumes already issued are well varied: Mrs. Gaskell's *Cranford,* Goldsmith's *Vicar of Wakefield,* Lamb's *Elia,* Dickens's *Tale of Two Cities* and Thomas à Kempis's *Of the Imitation of Christ.*

....Beautifully made is Walter H. Godfrey's *History of Architecture in London,* with the subtitle: "Arranged to illustrate the course of Architecture in England until 1800, with a sketch of the preceding European styles" (Scribner; $3). There are several maps, besides the 250 diagrams and illustrations. This is a valuable work for the student of architecture, and should have decided interest for the American tourist who remains in London long enough to occupy himself with something more serious than bus rides.

....A heroine of romance who spends her time making butter and looking after aged aunts and all the children and chickens in the neighborhood is a refreshing and wholesome companion. Such is Rose Mary in *Rose of Old Harpeth,* by Maria Thompson Daviess (Indianapolis: Bobbs-Merrill Company). The only morbid note in the novel is that so sensible and capable a woman should dream of paying a mortgage with herself, in the old-fashioned way. Such a revolting idea is out of place in this hearty story of a Southern farm.

....A new edition of the excellent Wentworth, *Plane and Solid Geometry,* comes to us from Ginn & Co. The text book is revised by George Wentworth and David Eugene Smith. With it comes the slim volume entitled *Vocational* Algebra, by the two collaborators (Ginn, 50 cents). The publishers feel that the time has come "when algebraic language has such a well-defined place in trade-journals, artisans' manuals, and handbooks of business" that there is a special need of its interpretation. Here are the essentials for the practical worker.

....A most attractive pocket edition of Browning's *Dramatis Personæ and Dramatic Romances and Lyrics* bears the imprint of the Houghton Mifflin Company ($1.25). There are ten illustrations in color by E. Fortescue Brickdale—an English artist. These compare well with their kind, but is not the illustration of Browning a somewhat officious performance? Opposite the lines:

> If one could have that little head of hers
> Painted upon a background of pale gold,

one finds a reproduction of Mr. Brickdale's idea of that head. Frankly, we prefer Browning's impression.

....*The Story of Mary MacLane* again! No, we had not forgotten her but so many other young women have tried to shock the world in the nine years since and have had to resort to more and more violent efforts to do it, that the attempt of the Bashkirtseff of Butte

events here and there by comparison. From her added postscript we judge she has not changed much in temperament from nineteen to twenty-eight. She has renounced the devil but not all his works since she has a passion for Martinis, money and life in New York [illegible]. But she's back in Butte! (Duffield, $1.60.)

....The last but one of the "war governors," Samuel J. Crawford, tells the story of *Kansas in the Sixties* (McClurg; $2) with a wealth of detail that makes it valuable for historical purposes but rather hard reading for those not directly interested in the persons and events. The author went to Kansas in the days when it was struggling to free itself from slavery and the Missouri laws imposed upon it by raiders from across the river, and he took an active part in the wars against the rebels on one side and Indians on the other, as well as in establishing the educational institutions of the State.

....Ward Hill Lamon died in 1893. Two years later a small volume of his compiled chiefly from material left only partially arranged by him, was issued by his daughter, Dorothy Lamon Teilard. The new edition as a book of 337 pages consists of that work with some additions—a few notes, letters and a memoir of Colonel Lamon himself, brief enough, but showing pretty clearly the close relation existing between the President and the man selected by him as companion and friend in the famous journey to Washington and in the four years of stress and personal danger while the President was the shining mark for all the slings and arrows of outrageous fortune at the capital.

....French art differs from that of certain other nationalities in that "artistic continuity embraces very different styles, all equally original and sincere. . . . Each century, from Philip Augustus to our own day, has partisans." That fact lends interest to the history of French art, especially when the historian is M. Hourticq, contributing to Scribner's General History of Art: *Ars una, species mille.* His work has 469 pages, including bibliographies and many illustrations. The index does not give the name Matisse, but that is not because this Inspector of Fine Arts fails to carry his history beyond the classic and romantic periods. There is an excellent account of Naturalism that extends to eighty-five pages. Neither art nor architecture is neglected. The method of treatment is thruout truly historical, and the result is a compact work rich in suggestion. (*Art in France.* By Louis Hourticq. New York: Scribner's. $1.50.)

## Pebbles

MR. HENRY JAMES is believed to be a warm advocate of the indeterminate sentence.—*New York Evening Post*

THE crowds that gather to stare at the vacant place on the walls of the Louvre formerly occupied by the Da Vinci portrait are five times as great as the crowds that came to look at the picture.—*New York Evening Post.*

IN a bachelor apartment house in Washington a Japanese valet to an army officer takes his instructions from an Irishman. "Pardon," he said one morning, "what to do now? My master told me to wake him at eight, but he did not go to bed till nine."—*Success*

THE CALL OF THE COOK.

Oh, when I married Linda, I asked her: "Can you cook?"
She just looked wise and answered: "I know my little book."
And since that time she's fed me on dishes *à la* France,
With Sweden, Spain, and India thrown in when there's a chance.
I've breakfasted on waffles with jam and mayonnaise,
For lunch I've seen spaghetti cooked in fifty different ways;
And, when I'm called to dinner, quite often there will be
Hungarian goulash on the board, Scotch scones, and Russian tea.

My appetite is hearty, and I dote on simple food,
But if I should confess it my wife would call me "crude."
So all my meats are stuffed and braised, croquetted and sauté-d,
My vegetables au gratin-ed, my desserts are glacé-d.
I'm steeped in spice and curry, I'm filled with crumbs and paste
(I'm pretty sure that nothing in *our* kitchen goes to waste).
And when, with all my hungry soul, I yearn for Irish stew,
I hear the carol of the cook: "Just taste this Swiss ragôut!"

I sigh for beefsteak simple, but my sighing is in vain.
I'd give a whole week's salary to see an egg cooked *plain.*
I love a boiled potato, but always, 'pon my soul,
They're minced with peppers, nuts, or cheese, or served en casserole.
How I would relish pork-and-beans! And O! what a relief
'Twould be to find upon my plate a hunk of good corned beef.
But hark! A voice calls: "Dinner, John! Come see what I have made:
Here's shrimp soufflé with Creole sauce, and mushroom marinade!"

—*Puck.*

# The Independent

Entered at New York Post Office as Second Class Matter

Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Political Tides and Portents

If one were to believe the newspapers, there is every month a flood tide or a neap tide to President Taft's political popularity. At one time, when he has achieved some remarkable success, the entire people acclaim the wisdom of the man who could get his will from Congress, or who has negotiated the best treaties ever devised; and a few weeks later, a concurrence of criticisms shrills the air like a forest of locusts, to be exchanged after another month for a chorus of tuneful applause. For the first year of his incumbency he was called the echo of Roosevelt; and then he was the treacherous reverser of his predecessor's policies; and yet a little later he was approved as an abler advocate of peace than the man who had earned the Nobel Prize.

Just now, by the concurrence of various voices, Mr. Taft has fallen to his nadir and cannot be nominated or elected. Western insurgency has the rostrum and will have it so. Senator Cummins, of Iowa, so declares, and Mr. Medill McCormick, representing the Chicago *Tribune*, says that if nominated President Taft would get fewer electoral votes than did Bryan in 1908; and just now Mr. Roosevelt has come out with an attack on the arbitration treaties which the President has set his heart upon.

If we were to trust Senator Cummins, Senator La Follette is the star of hope, while Mr. Taft is past redemption because of his many mistakes, of which the last is his veto of the bill for the admission of Arizona and New Mexico, following his campaign for reciprocity with Canada, which Senator Cummins calls "a false pretense from beginning to end." He says that it is a "Progressive proposition that Congress has no right to prescribe constitutions for these incoming States." But why not now as well as when the States in rebellion came back into the Union? Congress has full right under the Constitution and under all common sense to judge freely for itself whether an applicant Territory, Arizona or Porto Rico, shall be accepted as a sister State into our family, and the President has full liberty to exercise his right of veto; for the Constitution says of every act past by Congress, "If he approve he shall sign it, but if not he shall return it with his objections," which is just what he did. The Constitution says, "New States *may* be admitted into this Union," not *must* be admitted. It is permissive, and Congress and the President would be remiss in their duty if they did not use their best judgment. It is only last year that Senator Cummins spoke and voted to put conditions on both these Territories that should be acceptable to the President and Congress; now he objects to conditions.

Ex-President Roosevelt has said very little about Mr. Taft's policies and record, and he has properly been silent, even altho the public has been justified in believing that in some matters, as in the Pinchot dispute, he held the President to be in the wrong. But now he takes his stand with those in the Senate who demand amendments to the arbitration treaties with Great Britain and France. He has the full right thus to express his opposition, but we do not believe this will seriously affect Mr. Taft's popularity. The people will go with the President in this matter. Mr. McCormick's statement is a testimony of what he has discovered, namely, that the

people East and West are dissatisfied with the President's stand pat record, and will not support him for re-election. He finds Progressives in every New England State but Massachusetts, where he has not yet looked for them, perhaps remembering that the infection there began with the demand for Canadian reciprocity, a kind of Progressiveness which he does not favor and the President does.

In answer to all these complaints and forebodings of change the President goes on in his own way, using his best judgment and doing admirable things. He has made mistakes, such as that confest in the Norton letter, with unusual imprudence, and no less, we judge, in the matter of Mr. Pinchot, again corrected by the withdrawal of Secretary Ballinger and his replacement by a man who satisfies Mr. Pinchot's friends. He is now started on a tour of speeches, beginning with New England, and which will invade the hostile territory of the West. He will defend reciprocity and the arbitration treaties and the great measures whose world-wide influence makes him a statesman; and we believe the American people will recognize and approve his large and generous policy. He is no stand-patter; he is himself one of the first of the Progressives, even if he cannot hike with some Insurgents who are more eager to attack him than they are to relieve the people of burdens.

They complain that he insisted on reciprocity, which reduced the tariff, and yet that he vetoed the tariff bills. They criticise equally what he did do and did not do, and they declare the people will have none of him in 1912. But that is more than a year off. By that time Canada will have accepted reciprocity and no evil will have come to the Western farmers. It will have approved itself. The vetoes will have been forgotten, for before that time Congress will have acted on bills reducing the tariff. They can pass Congress only by the agreement of Democrats and Progressive Republicans, and any such bill the President would sign and thus satisfy the complainants. Or, if the Democrats and the advanced Republican wing would not agree, it would be clear that the President would be out of it, and all blame would fall on Congress. While our sympathy is with the advanced Republican wing, we believe that the President has plainly shown that he favors the relief of undue taxation which they advocate, and the rights of the people as against selfish interests, and that the hostility to him is due to hasty misunderstanding and failure to consider his larger statesmanlike policies, where it is not due to personal and factional ambition.

## The Unearned Increment of Art

Two interesting questions arise from the stealing of Leonardo da Vinci's masterpiece from the Louvre: How much did the thief gain by it and how much did France lose by it? In an ordinary case of theft the answers to the two questions would be approximately the same amount. In this case they are as far apart as possible. The picture in the hands of the thief has no monetary value whatever. Except for the remote possibility that some time he may safely exchange it for a ransom it is to its present possessor merely an expense and an embarrassment. On the other hand, the Louvre is the poorer by an amount variously estimated in millions of dollars, but really impossible to determine. It is rumored that the British Government once offered a million pounds for the picture. Doubtless this sum could have been obtained for it if it had been put up at auction some time when the French Government was hard up for money, say, to fight Germany. Mr. Frick, ex-cokeburner of Pennsylvania, paid in one year a million dollars for three pictures—a Hals, a Gainsborough and a Velasquez, none of them so famous as "Mona Lisa." Or if the Louvre authorities had put the picture in a separate room and charged the tourists five francs apiece to see it, the income derived from it would probably indicate a valuation of several million dollars.

Suppose now some clever French artist, moved by patriotism, should get a wooden panel and paint on it a perfect imitation of Leonardo's picture, hiding it away in some Paris garret, where in due time it could be discovered. If ever forgery were justifiable, surely here is a

case, for France would be five million dollars the richer and nobody the worse for it. In fact, who knows whether the stolen "Mona Lisa" was the original or only an imitation? Any patriotic Spanish artist will swear that the original "Mona Lisa" is in the Prado Museum at Madrid and that the one in the Louvre is only a replica or a copy by a pupil. Certainly the Prado portrait corresponds more nearly to Vasari's contemporary description of it, and in coloration it is superior to the one in the Louvre. A year ago it was asserted by one of the Paris papers that "Mona Lisa" had been stolen from the Louvre and replaced by an imitation.

But really it does not matter in the least whether the stolen picture is an original, a replica, a copy or a forgery. Its pecuniary valuation does not depend either upon its artistic merit or its actual authenticity. This is proved by the fact that a picture equally meritorious, by a modern and unknown artist, would not be worth so much, while an undetectable forgery would be worth just as much. Its value depends merely upon what is thought about it. That is to say, it is worth whatever people think it is worth. A unique object is insusceptible of the ordinary methods of valuation. Its value cannot be calculated by the cost of production or of duplication. "Mona Lisa" was bought in the first place by Francis I of France for $4,000, a good fair price for that day or for this. At the present time the picture is of course not intrinsically worth so much for two reasons, because the varnish has darkened, the colors changed and it has been extensively retouched, and because there are so many more artists nowadays who can paint as well. "Mona Lisa" differs from many of the paintings which have come down to us from the Renaissance in being still attractive and interesting to look at despite the ravages of time and the changes of taste, altho it is doubtful whether it would be accepted by the hanging committee of a modern exhibition if presented in its present state by an unknown artist. But, however that may be, the present intrinsic value of the picture is obviously the sum of money which a modern painter would charge for a copy indistinguishable from the original, or, if that is regarded as impossible, one so near like it that, apart from its authenticity, it would be regarded by competent judges as equivalent. The difference between this sum—say $1,000 to make a generous allowance—and the $5,000,000 at which the stolen picture is valued, is the amount which has been added to the worth of the picture by public opinion; or, in other words, it is value created by society, not by the artist. It is the unearned increment, if we may adopt Henry George's phrase.

We are fortunately not obliged to rely upon a hypothetical case to prove that the valuation of such works of art is mostly factitious or fictitious. We can see how much the reputation of Leonardo da Vinci is worth by a recent example. A year or two ago Dr. Bode, of the Berlin Museum, purchased for about $30,000 a small wax bust of Flora accredited to Leonardo. As soon as the sale was announced it was claimed that the bust was made by Lucas, a modern English sculptor. Friends of Lucas came forward with personal testimony and various other evidence to prove it. In this emergency to whom did the opposing parties appeal for decision? To artists or connoisseurs? No, for no man on earth is capable of distinguishing between Leonardo and Lucas on artistic grounds. They appealed to the chemists, and, after an analysis of the wax, an interminable discussion arose as to whether Lucas used paraffin or Leonardo used spermaceti. Probably the question will never be decided, and we shall always be in doubt as to whether the bust of Flora is worth, say, $100 as the work of Lucas, or a thousand times that as the work of Leonardo. Luckily it makes no difference either to art or to history. But the incident is of interest because it shows clearly that the artistic merit and intrinsic value of a picture or statue is a very small part of its selling price, so small in fact that it may in most cases be altogether disregarded.

How much would the original parchment of the Declaration of Independence bring at an autograph auction? Yet much better specimens of penmanship in bright black ink can now be got cheap. A Mauritian postage stamp sells for a thousand dollars. Now, it is not worth

a thousand dollars merely as a stamp, nor is "Mona Lisa" worth five million dollars merely as a picture. The island of Manhattan was bought from the Indians for $24. It is now worth a million dollars an acre. But the Indians were not cheated. The high values of land on this island are due to the fact that so many of us want to live on it. The high value of "Mona Lisa" is due to the fact that so many of us want to see it. It has been looked at, and studied, and written about, and admired for four hundred years, and this long continued and co-operative effort has enhanced its value enormously. The artist put $4,000 worth of work on that wooden panel. We have been working on it ever since, and our share now amounts to something like $4,996,000. But this accretion is less than the commercial rate of interest. If Leonardo had put his money in the hands of one of the Florentine bankers, and nothing had happened to it in the meantime, his heirs and assigns would now be far richer than if he had left them the picture to sell today.

Leonardo da Vinci was one of the most remarkable men that ever lived and the world has always taken a great interest in him and in the third wife of Messer Francesco del Giocondo, his sitter, and in their contemporaries and in their times. The beauty of the picture is but skin-deep, but our eyes see thru and beyond the paint. We see in it all that we have got out of it.

## Evil Journalism

THE past week has been one in which a man of moral principles, not to say of fastidious tastes, would desire to exclude even so-called decent newspapers from his home. Pages on pages have been filled with reports of the trial of a miserable murderer in Virginia, a case whose story, much more its details and discussion, can do no good to man, woman or child; and yet in all its badness it has been thrust into the homes not only of the vicious, who dote on such stuff, but of those who would not befoul their minds with its indecency. It would have been enough for the Virginia papers to give in five lines the fact of conviction, while New York and Chicago and New Orleans papers would have served the community better by excluding any mention of the trial whatever. We need a law to limit the freedom of the press in these matters.

During the same week columns on columns have been given to mischievous tittle-tattle about the expected marriage of a very wealthy divorced man of a famous name to a young girl. In this case there is one serious and important question involved which does affect the community, namely, the propriety of his remarriage, but it was not to this that the press confined itself. The man is forty-seven years old. His wife had got a divorce from him in New York, a State which allows no divorce except for adultery. He was proved an adulterer, and the decree of the court was that he should not marry again during the life of his wife, who has since lived abroad and is believed to have been given by the settlement some millions of dollars. Not able to remarry in New York, the wealthy criminal married last Saturday in Rhode Island a girl of nineteen, by the consent of her parents, who are residents of the State of New York, and who know well the law of the State, the decree of the court, and how false the man, more than twice her age by eight years, had been to his first wife. It is past conjecture what worthy reason her parents could have had to encourage the courtship and approve the marriage. The papers did not discuss the propriety of this remarriage, but devoted themselves to the search after the minister who would solemnize the nuptials, for it was understood that religion must ratify the union which the State of New York had forbidden.

Whether remarriage should be allowed to a guilty divorced person, who by infidelity, cruelty or desertion has forfeited his rights in a first marriage, is an abstract question not to be settled by a concrete case. It is to be settled by its effect on society, which has created the rule of marriage, and has formulated it in law. The Church has the same relation to marriage and divorce that it has to every other moral question which is to be judged by its bearing on human welfare; and this effect will usually be exprest by legislation, as is the case with

murder or theft. That one should be very chary about marrying one who has proved himself untrue to his marriage vows is plain, but it is another question whether it should be forbidden. In this case in a very brief statement the man has given the only apology possible when he said that remarriage was better for him and for society. There is force in this. We would rather have a wildcat or a hyena chained, even tho we feared it might break the chain; and it is somewhat better for society that a divorced man should be held by uncertain bonds than that he should be let wholly loose, to the greater peril of society. If any woman thinks he has reformed, or that she can hold him to respectable morality, and is willing to take the risk, we are not sure that society should forbid it; nor do we see any scriptural or other reason why the Church should forbid it. At the same time we give our hearty respect to those clergymen who would not be tempted by a thousand-dollar fee to solemnize a marriage which they believed to be wrong.

We imperatively need a uniform law of marriage and divorce; not a national law, for that would be unconstitutional, but an agreement of the States, and that should be a main topic to be discussed by the Governors in their present conference.

## Syndicalism

THE Socialist labor multitude has developed within itself a line of cleavage, and presently it will become two well-defined multitudes, each a distinct party with its own shibboleths. It is propagating itself by fission, and so obeying the general law of biological and of social evolution.

One of the two parties will be conservative and constructive. The other will be radical and revolutionary. One will rely on education, political activity, legislation and administration. The other will rely on strikes, sabotage, and violence whenever it is not met with superior force. One will draw into itself a part of the "intellectuals," not a "capitalist," and ultimately a large representation from the "bourgeoisie" or middle class. The other will remain "proletarian," but will draw to itself the intellectuals of anarchistic or revolutionary sentiment, and will absorb most of the anarchist-communist groups. One already goes by the name "Parliamentary Socialists," the other by the name "Syndicalists." One has hitherto been relatively strong in Germany, the other in France. Until now the English Labor party has worked mainly along the lines of parliamentary socialism. The recent strike revealed the increasing strength of syndicalism.

Both parties will claim to be followers of Marx—until they get tired of it. It would take a cleverer man than Marx himself was to say whether his writings most favored parliamentary socialism or syndicalism. The "International," which was the first organized expression of Marxian propagandism, was essentially syndicalistic, but for a quarter of a century the Socialist movement has been on the whole political in character.

But political socialism has never succeeded in enlisting the genuine interest of the great body of unionized wage-earners. The unions have been practical rather than theoretical, and have experimentally developed their own policies of aggression and defense. The strength of syndicalism lies in its frank adoption of the trade union organization, of trade union "views," trade union catch-words, trade union policies and trade union methods. Into these it injects revolutionary teachings, in particular and with emphasis, the doctrine of "the class war." It aims to bring trade union organizations into correlation thru federation, and to assemble resources for "the general strike."

To sober-minded students of the socialist movement it has long been clear that "the general strike" and revolutionary activity in all its varieties are essentially anarchistic. Logically, socialism is constructive. Naturally, however, indeed inevitably, the earlier stages of the modern labor movement brought together into the ranks of aggressive antagonists to things as they are, both the elements that would reform and reconstruct, not despising opportunist methods, and the uncompromising spirits who would concede nothing to "the existing social order," and whose ideas of what

would happen after "the revolution" varied all the way from communism to anarchistic individualism.

Not less inevitably these miscellaneous factors were bound to sort themselves out in time, and the segregation is now well under way. To minds that have never taken the trouble to know anything about socialism, the discovery will come some day as a bewildering shock that the militant, striking "looking-for-trouble" labor party sneers at political socialism and describes it as a paltering, stupid, bourgeois attempt to hold the working man back from his rightful heritage; but already the out-and-out syndicalists are talking in that strain, and the chorus which takes up the cry is every day growing bigger and deeper.

It really would seem a little odd if all the "mossbacks," "respectables," "time-servers," "retainers" and so on should by and by be collectively labeled "socialists," and under the banner of socialism should fight in defense of a stable social order against the revolutionary syndicalists. It would be paradoxical, but what is evolution but paradox?

## A Weapon of Precision

It is the purpose of the initiative and referendum to give us a weapon of precision. A party convention knows what the people want and promises it in the platform adopted, but that does not assure its enactment as law, for the candidates elected to the legislatures or to Congress may not do what their platform promised and what the people want, but what will please the political bosses. Because one party fails to keep its promises the people turn it out and put the other party in power, and it is just as faithless. President Taft, as also Governor Hughes of New York and Governor Wilson of New Jersey, have made earnest appeals to the people to put pressure on an unwilling Congress or Legislature. They had no weapon of precision.

Within the same week two New York dailies have given us illustrations of the danger that comes from the lack of such a weapon of precision as that which is possessed by Oregon and Switzerland. Our esteemed contemporary, the New York *Times,* commenting editorially on the campaign now in progress in Canada, stated its belief that Premier Laurier would probably be returned to power with a mandate from the people of Canada to consummate the pending reciprocity agreement with the United States; but that the only element of doubt in the situation is the fact that the Opposition in different localities is emphasizing other issues, hoping to defeat reciprocity by defeating Laurier on the other issues.

In like manner, another esteemed contemporary, the New York *World,* gives editorial expression to its fear that the tariff vetoes of President Taft may endanger the arbitration treaties with England and France. It believes that one of the unfortunate results of the vetoes will be to precipitate tariff discussions, under cover of which the Senatorial opponents of the treaties will seek to shelve them indefinitely.

For the purpose of this argument, we will assume that the apprehensions of these journals are well founded, and that these two desirable pieces of legislation are jeopardized by the acts of public officials in regard to matters quite unrelated. It is no new political situation that they bewail. Very often a good man has been defeated because of advocacy of an unpopular cause, while it is a common piece of political strategy for a discredited official to rehabilitate himself by espousing something that will enable him to hide his tattered reputation behind the unblemished garments of reform.

It is a principal failing of our present system that there is in nearly all cases a complete lack of definiteness about the results of an election. The day after we know no more of what will be done for us (or perhaps to us) than we knew the day before. We have made choice of certain individuals, and they may heed our exprest wishes or they may not; they may keep their promises or they may not. We may have elected the corrupt man who mumbled the proper shibboleth, which he nevertheless intends to disregard, and may have rejected the man of honesty and sincere purpose. The only positive thing is that we must take what

we get, whether it is what we want or not.

If the powers of initiative and referendum were reserved by the people, the obvious evil in this state of affairs would be corrected. There would be no need of gambling with fate as to the character of our representatives. To speak of the Canadian case, let us consider the dilemma of the farmers of Western Canada, who have cause of resentment against Laurier, but who favor reciprocity. If they had initiative and referendum they could reject Laurier and still have reciprocity. Let us consider the people of the United States in the matter of the arbitration treaties. They could condemn the vetoes of President Taft and still insist upon the ratification of the treaties.

These cases only partially illustrate the uncertain result of delegating final power of legislation to representatives. Another illustration is timely. The people of New York undoubtedly desire a direct primary law. The platform of the successful party declared in favor of such a law. Yet it is doubtful if such a law will be enacted; or, if enacted, if it will do more than keep the promise to the ear while breaking it to the hope.

The central fact about the reservation of power by the people is that they can definitely decide any given question on its merits, without complications concerning unrelated questions and without the necessity of regarding the personality of candidates. Wherever the referendum obtains it is the custom to submit concrete propositions, which stand or fall on merit alone. The representative who is overruled need not be repudiated, any more than the representative who has declared in favor of a popular proposition must be indorsed, altho he is otherwise objectionable. It is a usual thing in Switzerland that the constituents of a representative differ from him on a particular question, but he does not therefore forfeit their respect and confidence. He may be and frequently is re-elected by the same people. But the retention of the power of final decision by the voters makes it possible for them to consider independently the merits of measures and of men.

## Aeroplane Motors

If the object of the large awards in prizes for new records in aeroplane flights is to encourage the progress of the art popularly designated "aviation," it would seem that part of this money might more profitably be employed in another way. It is established to the satisfaction of all in interest that an aeroplane to which nothing happens, operated by a man of good judgment and steady nerves, will go as far as its fuel supply will carry it. With very few exceptions the accidents which have occurred during many months past have been due to the stopping of motors from one cause or another. It is also established that every man who can ride a bicycle can fly, if provided with suitable apparatus, and the number of those who would unhesitatingly undertake to make the journey from New York to Liverpool in one flight, if reasonably assured that their motors would keep going, would man the largest liner in the Atlantic service. But this is just the assurance which, in the present state of the art, cannot be given. Hence, the suggestion that part of the money expended in encouraging demonstrations of the undisputed fact of long flights could be employed with greater advantage in perfecting the aeroplane motor.

It is doubtful if, up to the present time, the highest mechanical skill available has been directed to the study of this problem. The motor has been "taken for granted," and the study of flying largely directed to other details of aeroplane construction. As a matter of fact, the motor is more important than anything else, since if it is powerful enough most other details are negligible. Just here is the difficulty. It is necessary to economize weight to the last ounce. In doing this it is a constant temptation to sacrifice strength and stiffness. Parts subject to strain, if not strong enough, are sprung or twisted or broken; if too strong they are likely to be too heavy. There is, of course, a theoretical point of just strong enough, but between theory and safe practice lies the great gulf fixed by the inequalities and unreliability of materials, In every calculation of dimensions the engineer has to allow a factor of safety

which is anywhere from two to five, and sometimes more.

Very likely the unsatisfactory performances of a great many aeroplane motors may be attributed to the fact that neither in design nor in construction do they represent the highest skill of the time. There are not enough in use or in demand to warrant the highest talent in the profession of mechanical engineering in making a business of designing or building them. But flying will not attain its best development until the motor is brought much nearer perfection than it now is. Development in this direction may need the stimulus of substantial money premiums, and, as there appears to be very little difficulty in providing large sums for record breaking flights, a sufficient purse for a motor which will not break down, or "get jammed," or do any other unexpected or awkward thing, should easily be raised. Incidentally, the fuel problem should, and doubtless will, receive careful consideration. To save weight, a very much higher fuel economy than is necessary in automobile propulsion must be attained, and that this is easily possible no one familiar with the operation of the direct combustion engine will doubt. On these two things depends the ultimate in air navigation.

## Bread for 1950

THE most important investigation recently undertaken by our Agricultural Department at Washington concerns the possible bread supply of the future. The work has been done by Prof. M. A. Carleton, who read his report before the Millers' National Federation meeting, at Minneapolis. It is a timely piece of work, more particularly because we have recently heard so much dreary prognostication as to the possibility of the United States meeting its increased population with an increased food production. Mr J. J. Hill went so far as to tell us that before the middle of the century we would be compelled, not only to stop exportation, but to import wheat to feed our own people. In the same spirit President Brown, of the New York Central, has considered it necessary to assist in bringing our farms up to their maximum production, by railroad cooperation along productive lines. There is a nervous feeling everywhere among our people, that a very largely increased population will be coincident with a very greatly depressed vital condition; and that it will be impossible adequately to feed, say two hundred millions of people (or three hundred millions, which is more likely to be the figure by the end of the present century).

Professor Carleton begins by considering the possible increase in wheat production thru an expansion in farm area, as well as thru a larger percentage of the present area devoted to wheat. Of our land area of nineteen hundred millions of acres less than one half is cultivated. The coming census may increase this proportion to a little more than one-half. Considering the progress made in draining the larger swamp areas, and turning the grazing districts into farms, it is not too much to anticipate a considerable addition to the wheat acreage by 1950. The professor estimates our farming area at that date at about 70 per cent. of the total land area. The percentage of future possible wheat acreage he would put at about sixty-nine millions; this would be an increase of twenty-two million acres devoted to that cereal.

It has been supposed that the production of wheat per acre has been considerably on the decrease. This was true for a long period of our history, but it is not true at the present day. On the contrary there has been a slow creeping up in production, owing in part to wiser methods of tillage, and in part to varieties grown. Two bushels per acre is reckoned as about the present gain. This brings the average yield to a trifle over fourteen bushels per acre; at the same rate of increase we should reach considerably over sixteen bushels per acre by 1950. This estimate, however, is quite below the probabilities. Better methods of seed selection and better methods of culture are revolutionizing farming in every direction. This is so true that we find in some of the older States, which have gone back to wheat raising, an average production of over twenty bushels. It is hardly a radical estimate, if we assume twenty-five bushels an acre as the average for our farms fifty years hence.

The introduction of the Fife wheat,

thru Scotland and Canada, into our Northern States, and the Crimean or Turkey wheats, thru the Middle States, added to our production some fifty millions of bushels more than could have come from the older varieties. What is yet to come we do not know. The Durum wheat has penetrated localities too dry for other wheats, and has added at least thirty millions of bushels to the wheat production of the great plains. This record only indicates what can be done, and points the way for further experiments. The Agricultural Department announces just now, among a large number of new fruits and cereals, a wheat from Turkestan, and another from Algeria, that will make California as good a wheat-producing country as the Dakotas.

But we have to count immensely on the improvements in farming methods; a gain that has only begun to show. The extensive farm has given way to the intensive; and while this will possibly check the acreage given over to wheat growing, it will very greatly increase the product per acre. We have just found out that land need never be run down in its productivity; but that it may be increased in its power to yield, altho taxed for centuries. Our discovery of the power of legumes to take nitrogen from the air and add it to the soil directly, while they add enormously to the humas. if plowed under, is an illustration of what the modern farm will be expected to do. It will make soil and never exhaust it. The yield of wheat per acre following leguminous crops and the plowing under of green rye is reported as twenty-two bushels greater than that of wheat following wheat.

Statistics of other countries show that the estimates we have given are decidedly conservative. Professor Carleton reports the average production in Germany as over twenty-eight bushels per acre; in France it is over twenty bushels, and in Great Britain it is over thirty-two per acre. The acreage devoted to wheat in Hungary has increased nearly three millions within the last twenty-five years, and in European Russia it has nearly doubled since 1894. Proportionate expansion is found in all other wheat growing countries, and everywhere there is an increase in per acre yield. Austria has gained three bushels per acre and Germany over five.

Canadian production is a matter of great importance, not only on account of the vast area of wheat lands held by this northern neighbor, but its proximity to our markets. Professor Carleton thinks that wheat production in Manitoba and two other adjacent Provinces has only begun. With the present production of twenty-two bushels per acre, increased to twenty-five bushels (which is a rational estimate), there would be an annual production of seven hundred and fifty millions, or an increase of six hundred millions over the present production. These figures do not concern the possible production of other parts of Canada.

Argentina's wheat production is increasing with enormous rapidity, and is set down by our professor at four hundred and fifty millions of bushels for 1950. Patagonia is held to be an ideal wheat country, not yet at all exploited. Summing it all up, we have an estimate of one billion five hundred millions of bushels added to foreign production, and nine hundred millions to the production of the United States, giving a total of very nearly two and one half billions bushels of wheat to be added to what we now produce. Now consider the very probable change of habit, in dietary, and we shall see that the world will be supplied with wheat fully satisfactory to its demands at the middle of the present century. The fact is that the evolution of new food products is likely greatly to decrease the relative demand for any one of the grains or vegetables or fruits now chiefly consumed.

The outlook is therefore in no way alarming, provided we keep pace with scientific knowledge in our agricultural methods. The old-fashioned farming of chances is passing out for a tillage that is not at the mercy of drought and deluge. Population will not overtake food supply, till, according to the Malthusian idea, we pray for wars, pestilence and famine to restore a balance. A day of superb co-operation is coming, in which all the industries will pull together, and when every acre will be enabled to do its share in feeding the people. The United States can easily support six hundred million, possibly twice that number, in comfort if not quite in affluence

ence. We must teach the arts of production more than the arts of traffic, and bring our young folk to a glorification of the science and art of creating.

**Philadelphia Again**

There is nothing dull about Philadelphia politics this fall. The Catlin commission, appointed last spring to "go after" up-State judges, has undertaken to find out why prosperous Philadelphia is always staggering on the edge of bankruptcy, and how contracts always seem to be awarded to the same contractors. It seems to be a well-rooted practice of the Philadelphia municipality to accept the low bid of a favorite contractor, and then to forget about the specifications which were insisted on to shut out effective competition. The investigation has the backing of Senator Penrose, who expresses eagerness that it shall proceed "without fear or favor." Senator Penrose is angry that William S. Vare, formerly a member of the favored firm of Vare Bros., municipal contractors, should, with Mayor Reyburn's encouragement, aspire to be mayor. Good citizenship is certainly outraged by the dismissal of city officials and policemen for refusing to "work" for Vare at Reyburn's command. The Senator and his allies support for mayor George H. Earle, Jr., a picturesque figure in local finance and an able reorganizer of defunct banks and stock companies. Doubtless Mr. Earle cuts a much more respectable figure than Mr. Vare, and is an abler man altogether. But Senator Penrose's and State Senator McNichols's support of him must be regarded by independents as a disqualification. The primaries will occur September 30, and there are at least two prominent independent candidates, Rudolph Blankenburg and D. Clarence Gibboney. Mr. Gibboney is an excellent man, but a perpetual office-seeker. His ambition seems ill advised just now, when, as chairman of the Keystone party committee, his efforts should have been directed to harmony rather than to office for himself. Fusion between the independent Republicans and the Democrats is greatly to be hoped for, with Mr. Blankenburg at the top of the ballot. And it should at least prove possible to elect a good mayor, on whatever ticket. This is the first occasion in sixteen years that the dominant party in Philadelphia has been openly split over the candidate for an important office.

**Socialism in Florida**

We find an explanation of the removal of a professor in the University of Florida for having said something that did not please Secessionists in the comment in screaming big, spaced, double-column type in *The Pensacola Evening News*. It charges that the Florida College for Women at Tallahassee teaches Socialism to its girls, and that it is "turning out Socialists by classfuls." At their late commencement the "orations" were full of rank Socialism, and two of them would have outdone Debs. Now some statements are on their face so ridiculous that we do not believe them, and this is one. We do not believe that anything was said more socialistic than is the common school. Yet the editor declares:

> "We have heard socialists on soap boxes speaking in the great cities, but we never heard more socialistic speeches than those two that night."

Then he picks out one professor who he says teaches rank Socialism to these trustful girls, and demands that he be removed, or the appropriation withdrawn. The explanation of the restraint of teaching which prevails in that State we find in the doctrine of education laid down as unquestioned in the closing paragraph:

> "That is a Democratic institution in a Democratic State, appropriated for by a Democratic Legislature, is under the supervision of a Democratic Board of Control appointed by a Democratic governor, and the school is supported by the taxes of a Democratic people, is attended by the daughters of Democrats and it ought to turn out Democrats; not Socialists."

**The Education of Criminals**

Just now thousands of small boys in the outskirts of all our cities are being educated to be criminals. They can be seen every Sunday and half-holiday, and even on other week days, in little companies hanging about private gardens and orchards, seizing a chance to steal apples, pears, peaches or melons. Often they carry a bag in which to carry their spoils, for it must be that their parents know what they are about and en-

courage their depredations, if they are not actually teachers of crime. Or they are sent early in the morning or on Sunday, at times with handcarts, to steal as big pieces of lumber as they can drag from houses in process of construction. So far as we have observed the police wink or are blind. But there is, for the social welfare, no better work that the police could do than to put a stop to such petty thieving. It can be stopped, and its prevention would save thousands of boys from growing up to be crimnials of the worst type. Householders should see to it that such boys are caught and put under restraint and given that energetic moral instruction which they do not receive at home. To punish confirmed criminals is good; to suppress schools of crime is better.

**Longevity**

Every year there are over 1,300,000 deaths in the United States. If we except accidents and a few due to old age, we have to set down the rest to preventable causes—certainly one-half of the whole. The loss incurred by this means is reckoned at three billions annually—this is to capitalize the labor that is lost. The Committee of One Hundred on National Health has organized the American Health League, the intent being to disseminate health information and secure health legislation. Professor Fisher, chairman of the committee, pointed out the aid that can be given by life insurance companies, and as a consequence two or three of the New York companies are engaged in a practical educative work to prolong human lives. One of them has established a consumptive sanatorium, and is busy distributing health literature among its policyholders. Health insurance is a new form of life insurance—that is, it undertakes to prolong life and to encourage every method of sanitation. Metchnikoff insists that human life should reach one hundred and fifty years; this is the ideal which seems to be aimed at by the agencies at work. It is surely pleasant to chronicle a new frontage of our financial institutions, from an effort to equalize industrial losses that follow death to a profound effort to put off death just as far as possible.

**Mission Policies**

Father Kenelly, a Catholic missioner in China, calls attention to one point of difference between Catholic and Protestant missionaries in that empire. With the exception of the China Inland Mission, no Protestant missionaries adopt the Chinese dress, but that is not the way with Catholics:

> "As to his dress, the missioner is clothed as a Chinaman—flowing garments, baggy pants and satin headgear, and in the heart of the country he generally wears the pigtail. The pigtail is being partially discarded at present. Some of the old missioners regret exceedingly the change from the time-honored custom of the past, but the young generation is progressive and deems reform necessary."

Which is the better way is not clear; the bishops go so far as to dress in all the state of mandarins. Father Kenelly says that in the missions about Shanghai there are more converts than the Protestants have in all China. But the Catholic missions are some centuries older than the Protestant, which is much to their credit, so that the habit of dress may not be important. Father Kenelly mentions another disadvantage which Protestants ought to be ashamed of:

> "A notable point about the Protestants is the number of their divisions. There are no less than ninety-two different denominations of Protestants carrying on work in China, and some of these have only two or three members."

**Trees for Streets**

The committee on tree planting in one of the larger California towns advises a particular kind of tree for each street in the city. This advice is unwise, for there are not a dozen varieties of trees that are suitable for city planting; that is, in any one locality. New York City tried several sorts of trees during the early part of the last century, among which was the ailanthus. These proved to be in many cases worse than useless, growing irregular, giving little shade, making much filth, or while in bloom emitting a bad odor. Probably, taking the country thru, the basswood is as good a tree for shade and sweetness and ozone as the continent holds. It has a tidy way of healing over wounds, and it is hardy as far north as the elm is hardy, while it can endure the climate of the Gulf States. The maple

is more generally planted than any other American tree, and it deserves to be if we are judicious in selecting the varieties. The hard or sugar maple does not endure wounds and rough usage as well as some of the soft varieties, and for that reason is not so generally used in some of the Western cities. All thru the Northern States, however, the Norway maple is incomparably the noblest and every way most suitable for our streets. It adjusts itself to city life as well as to country life; its juice is not sweet, but acrid and milky, so that it does not attract insects—in fact, it is immune to almost all insect attacks. If we add to these the catalpa, in some cases the elm and the beech, two or three of the oaks, the white ash, the tulip tree and the magnolia acuminata, we have nearly exhausted the list of best street trees. There are localities (but in the country) where the fruit trees are specially valuable; also the locusts. These are utterly unfitted for city planting. We believe our California friends can add to the list the eucalyptus and a few semi-tropical trees, especially the chinaberry and the water oak; but when the effort is made to select a tree for each street forty or fifty sorts will be required at least, and these cannot be secured.

Mr. Lloyd-George, Chancellor of the Exchequer, preaches sometimes and is a faithful attendant at church. On the first day after his return after the session of Parliament to his Welsh home he attended a Calvinistic Methodist Conference, afternoon and evening, and listened to three sermons and two addresses. President Taft can hardly beat that. A day or two after he spoke at the laying of the foundation stone of a Baptist church, and the following extract from his address illustrates the aptness with which he connects religion with public duties:

"One of the first tasks the Christian Church undertook after its foundation was to improve the material conditions of its members and to set aside officers for that purpose. There are certain people today who talk about Ananias. Ananias was a man who made a false return of the property he had sold in order to reduce his contribution to the community to which he belonged. There are many men of that type today."

We cannot see but that the marriage of Madame Eames to M. de Gogorza at Paris with ecclesiastical rites was quite justified under the laws of the Church. Both had been divorced. Madame Eames had never been baptized and her first marriage was to an unbaptized person; and she became a Catholic and received a dispensation from the Holy Office at Rome. M. de Gogorza had contracted a previous marriage with a Jewess, but it was a purely civil one and was regarded by him as null. We are glad to say that *America*, which gives these facts, makes no comment.

Here is something to think of in the address of Dr. von Luschan, Professor of Anthropology in the University of Berlin, in an otherwise admirable paper in the Races Congress at London:

"Let small-minded people whine about the horrid cost of Dreadnoughts; as long as every nation in Europe spends year after year much more money on wine, beer and brandy than on her army and navy there is no reason to dread our impoverishment by militarism."

But why not choose enrichment by abolishing both sorts of evil?

In the death of Prof. Francis A. March, of Lafayette College, in his ninety-first year, this country loses its oldest and most distinguished scholar of English philology. Nearly all the younger students have been his pupils, as our Sanskritists were of Prof. W. D. Whitney, or our zoölogists of Professor Agassiz. He was all but the last of the pioneers whose single influence could mold the scholarship of the country. Only Professor Gildersleeve, in Greek, is left.

It is not strange that the Interstate Commerce Commission is disturbed by the number of deaths by railroad accidents. In the last nine months 7,731 persons have been killed by such accidents, as many as in a severe battle, and since 1868, 165,561 killed and 1,344,136 injured. These numbers are tremendous, and the Commission must find means of increased safety for those who must travel.

At least we can be grateful that Mr. Kipling did not versify his epistle to the Canadians.

# Insurance

## Metropolitan Nursing Service

The nursing service of the Metropolitan Life Insurance Company for the first half of this year covers 63,488 cases nursed and 320,777 visits of nurses. This valuable branch of the Metropolitan work began in this city two years ago and has been rapidly extended. During June the service was given in 473 different cities and towns. This scheme extends only to holders of the company's industrial policies, but as they number over ten millions, the field is large. The service is without obligation. Agents are instructed to immediately report all cases of sickness discovered, and policyholders themselves are supplied with cards ready for mailing. Many instances of the saving of life are told. It is estimated that the cost will reach a half million a year when fully developed. Vice-President Haley Fiske does not know whether, as a matter of economy, the system will or will not pay. Some curious facts have been observed. For instance, more than once, in two cities of about the same size and industrial conditions, the death rate experienced by the company in the city in which there was a nursing service had decreased very much more than it had in the same period of time in the other city that had no nursing service. The work is carried on partly for business and partly for philanthropic reasons, but in either case deserves warm commendation.

The fire engine horses must go. Fire Insurance Commissioner Johnson, of New York, announces that by March 1, 1912, there will be at least 150 automobile fire-engines in operation in the city. Commissioner Johnson believes that the ideal fire fighting apparatus of the future will be the automobile hose wagon for the high-pressure district and the motor hook and ladder, both of which are far more swift than horse-drawn apparatus in use at present. The fire commissioner has also under consideration the adoption of a type of scout automobile chemical engine for the outlying districts. The twenty-one new fire horses which have been ordered will be equipped with automobile apparatus. Besides the argument of quickness in getting to fires, it is held that the elimination of horses will permit the lengthening of ladders and water towers, and will also permit the use of more powerful apparatus, which has heretofore been limited by the hauling capacity of the horses. The commissioner states that the wholesale introduction of motor apparatus will save the city several hundred thousand dollars each year in cost of maintenance alone, as the average life of a fire horse is between eight and ten years, while the life of a piece of motor apparatus, with careful attention, is limited only by the changing form of standardization. Then, too, the forage bills and other expenses of the horses will be done away with.

The Home Insurance Company of Hawaii has been organized at Honolulu with a capital stock of $100,000. Fifty per cent. has been paid in cash. The work of organizing was done by Zeno K. Myers, insurance agent at Honolulu and Hilo. The list of stockholders contains the names of prominent bankers and business men of Honolulu.

In consequence of the fatal High street fire at Newark, the factories and tenement houses of that city have been very generally provided with fire escapes. The number of these safety devices already erected is placed at 700, and local builders have been unable to supply the demand.

The Prudential Insurance Company is sending out small health leaflets, on the care of young children, including some health suggestions in general. The cardinal rules of health are summed up in this: cleanliness, fresh air, daily exercise, and moderation in eating and drinking.

# Financial

## Our Banking System

An interesting book recently published, entitled *A National Banking System*, by H. M. P. Eckardt (Harper & Bros., New York; $1.50), strongly advocates the institution of branch banks. The author maintains with truth that our present system of isolated local banks does not accord to agriculture and the great industries and trades the every-day support and encouragement that they are entitled to. The Canadian branch system gives efficient financial support to commercial activities. The frightful cost of our system of single office banks is evident from the report of the Comptroller of the Currency. Since 1890 the yearly average of insolvencies for national, State and private banks has been ninety-one! This means in dollars and cents that the people of the United States may expect each year that over $31,000,000 of depositors' funds will be locked up and that approximately $12,000,000 of the funds so locked up will be irretrievably lost. It is needless to say that no other great country has such a shameful record. Mr. Eckardt shows how a system of branch banking increases financial stability by eliminating the conditions which caused the country banks to withdraw their deposits from financial centers in time of panic. The branch bank system would leave the money where it was most needed. It would not draw the money to isolated country banks where there was no run. A system of branch banks would be an invaluable support to commercial activity. By means of it business and industrial enterprises would not be handicapped by lack of credit. To maintain one branch which financed large commercial or industrial enterprises with enormous loans, several smaller branches would be organized in rural districts to do a deposit business. In Canada, for example, the branches in farming districts of Eastern Provinces show an excess of deposits. This makes it possible to carry the excess of loans and discounts of the branches in Eastern cities and manufacturing towns. The branch system, by making it possible to handle direct loans, would lessen the control of the note broker. It would simplify our awkward system of capitalization by introducing the extensive use of commercial paper and trade bills for purposes of credit. A system of branch banks with a home office in each State of the Union and a branch in New York City would lessen Wall Street control by diffusing the banking power thruout the country. The change might be effected without destroying the value of the stock of the existing local banks. And this because the final combination would not be a chain of banks of the dreaded Heinze-Morse type, but a confederation of banks for the profit and well-being of each unit. Among the advantages effected by such a combination would be economy of operation, extra profit from right of note issue, expansion of business by means of new branches, and a larger market for the stock. Our readers will find in The Independent of December 23, 1909, an illustrated article on Canadian branch banks, written by this same author.

....Treasury officials estimate that $7,000,000 in gold is sent home by Chinese in this country every year. This sum does not include the amount carried there by returning natives.

....On September 1 a law went into effect in Chicago limiting the hight of new buildings to 200 feet. During the last few days of August work was begun, under the old law, on ten new skyscrapers, to cost over $20,000,000.

....The quantity of anthracite coal produced in Pennsylvania during 1910, with the exception of one year, was the largest in the history of the industry. The quantity produced was over 75,000,000 tons, valued at $160,000,000.

....The annual report of the Canadian Pacific Railway, just published, shows the gross earnings to have increased $9,000,000 for the year. The total net earnings were $36,000,000, against $33,000,000 last year.

VOL. LXXI NEW YORK, THURSDAY, SEPTEMBER 21, 1911 No. 3277

## Survey of the World

**The President Clears Dr. Wiley**

Before Mr. Taft left Beverly, Massachusetts, September 15, for his 13,000 mile "swing round the circle," he made public a letter to Dr. Harvey W. Wiley, the Agricultural Department's pure food expert, in which he exonerates him from the charges made against him by the Attorney-General. The evidence does not show, says the President.

"that Dr. Wiley was a party to the correspondence or the letters upon which the chief charge is founded, and that his action in the matter was only in accord with previous precedents in the department which justified him in doing what he did.

"With respect to the other persons charged I find an overzeal in Dr. Kebler and Dr. Bigelow which prompted a disingenuous method of squaring Dr. Rusby's desire for what he thought was adequate compensation with the contract which he and Dr. Wiley were willing to make with him, and that for this Dr. Kebler and Dr. Bigelow should be reprimanded by you. So far as Dr. Rusby is concerned with respect to this particular contract I do not find him at fault. For purposes of punishment or dismissal I cannot charge him with knowledge of the legal difficulties involved in his employment."

Secretary of Agriculture James Wilson says that the President

"has considered the so-called Dr. Wiley case carefully, decided it wisely, and that his decision will give general satisfaction thruout the country."

The President says, in part:

"I examined the record in this case a number of weeks ago and I reached the conclusion which I have stated here; but meantime, a committee of the House of Representatives deemed it proper to institute an investigation into the Department of Agriculture and especially into the Bureau of Chemistry and its relation to the department generally.

"It seemed to me under these conditions that perhaps it was wiser for me to delay until the investigation was completed and the report of the committee made. The committee has not made a report, altho I believe the evidence has been substantially closed, and will not do so until the next session of Congress. Further consideration satisfies me that there are very much broader questions involved in the investigation and the evidence there brought out than in the present charge, which is narrow and definite and can now be properly disposed of."

——The President's birthday fell on the day of his starting West. The defeat of Mr. Taft, if he is renominated, is predicted in a statement issued by the La Follette headquarters in Washington. The electoral vote is hypothetically distributed, showing a Democratic majority of 125 against Mr. Taft; New York, New Jersey, Ohio, Massachusetts, Maine, Indiana, Connecticut, Missouri, Colorado and other States being counted Democratic.

——Addressing a friendly audience in the Auditorium at Erie, Pa., September 16, the President outlined a plan whereby he hopes to meet the Senate's objections to the arbitration treaties with Great Britain and France. Mr. Taft suggests that the American members of the proposed Joint High Commission be confirmed by the Senate. He would even agree to dispensing with this commission if need be, leaving the decision as to whether a question was arbitrable or not to the decision of the board of arbitration. Still further, he would be willing to have this board pass upon the jurisdiction of the question

**The Governors and the Courts**

The House of Governors, meeting at Spring Lake, N. J., voted, September 14, to send a committee of three to appeal to the Supreme Court of the United States to check "the autocracy of inferior Federal courts." The vote was 25 to 1, and Governors Judson Harmon (Democrat, Ohio), Her-

bert S. Hadley (Democrat; Missouri), and Chester H. Aldrich (Republican, Nebraska) were named as the committee, which will protest to the Supreme Court that Federal Judges have unwarrantably forbidden States to regulate railroad rates within their boundaries. It will argue that Federal courts have unconstitutionally limited the powers of State legislatures. The decision to argue this case before the Supreme Court followed a discussion of Governor Hadley's address on "The Right of the State to Fix Intrastate Traffic Rates." He said that the question now pending before the Supreme Court was perhaps the most important which that court had faced in recent years. "If the right of regulation of the rates of transportation in intrastate commerce shall be denied the several States," he said, "then there will be enjoyed by the railroad companies the right to fix interstate rates of transportation free from any supervision or regulation." The pretext for the appeal will be the decision of Justice Sanborn, of the United States Circuit Court of Appeals, enjoining the Railroad Commission of Minnesota from regulating intrastate rates on the ground that such regulation could not be enforced, would deprive the roads of proper remuneration, and would interfere with interstate commerce. The Governors take the broader ground that unless the Supreme Court by its final decisions protects State rights the States will soon become mere Federal provinces. Governor Hadley said, in part:

THE HOUSE OF GOVERNORS, 1911

Front row (left to right)—Norris, Pay, Kitchen, Cruce, Neal, Harmon, Wilson, Tener, Pothier, Glasscock. Second row—Carey, Gilchrist, Plaisted, Aldrich, Wilson, Hadley, Crothers, Mann, Smith, Shafroth. Third row—Spry, McGovern, Foss, Burke, Hawley, Stubbs, Vessey. Back row—Adjt. Gen. Sadler, William George Jordan, Ex-Gov. Quimby of Vermont, and Ex-Gov. Fort of New Jersey.

The fourth annual conference of Governors met at Spring Lake, N. J., September 12, and held four daily sessions devoted to the discussion of taxation problems, employers' liability, interstate commerce, the initiative, referendum and recall, the federal courts and States' Rights, etc. Twenty-eight Governors out of our forty-eight visited Sandy Hook, September 13, and saw a 12-inch gun plump lead into a target 12,000 yards away. The House of Governors has existed, extra-constitutionally, since 1908. Of the present membership, two, Judson Harmon of Ohio and Woodrow Wilson of New Jersey, are probable candidates for the Democratic nomination for President, in 1912.—This photograph is copyrighted by Paul Thomson.

"The old question of State rights, the question of the right of a State to dissolve in so far as it is concerned the Federal compact, is of interest only from the standpoint of history. That question was settled by the terrible arbitrament of civil war. But the new question of State rights or the question of State authority is a vital and important question of law and public policy for us as a people to decide, and which it is peculiarly our

duty as the representatives of the people to discuss and consider."

Before the Governors adjourned, to meet at Richmond, Va., December 3, 1912, Messrs. Harmon and Hadley issued a statement "in view of the apparent misunderstanding by some of the action of the conference." The conference considered it advisable, says this statement,

"That a committee should be appointed to see that the State's side of this controversy is properly prepared and presented to the Supreme Court. The committee expects to deal only with the legal side of this controversy and the action taken yesterday was one of only ordinary precaution."

**Various Items**

First reports seemed to show that Maine had voted to repeal the constitutional amendment prohibiting the sale of intoxicating liquors within the State, but later figures made the result doubtful, with the final evidence in favor of repeal by a very small majority of an unusually large vote.——Commission government was voted down at a special election held September 12 in the town of Orange, N. J. The majority against it was only eighty-eight votes but the result was less close than the figures suggest, for the necessary 30 per cent. of last year's vote was far from being cast in favor of the new plan.——Great interest is taken in the municipal campaign in Philadelphia, where the powerful Republican organization is split over candidates for Mayor. Senator Penrose still supports George H. Earle, Jr., and exerts the influence of Federal office-holders as well as of many local politicians, including State Senator McNichol, in Earle's favor. The Mayor, however, is using all his resources as a master of spoils to work for the nomination of the former Recorder of Deeds, William S. Vare, formerly associated with Vare Brothers, municipal contractors. An uncommonly large number of citizens have registered, and the primary contest will be keen. A third Republican candidate, ex Judge Dimner Beeber, has, thru his campaign committee, brought into court the question of Mr. Earle's right to run for Mayor. Mr. Earle resides at Bryn Mawr, outside the city limits. The Democrats and independent Republicans ("Keystone party") are likely to nominate Rudolph Blankenburg, a long-time champion of reform, and a Republican free-lance. D. Clarence Gibboney is another independent candidate for Mayor. ——While Senator Penrose is busy with the political situation in Philadelphia, Senator Oliver has a fight on his hands in Pittsburgh. His enemy is Mayor Magee. The city and county tickets are involved, and the Mayor of Pittsburgh heads an attack on the State "ripper" bill which has ousted 1,000 mayors, burgesses, city treasurers and minor municipal officials thruout the State.——On the evening of September 16 twelve hundred section foremen and laborers employed by the Lackawanna Railroad received an official order to strike, issued by A. B. Lowe, National President of the Brotherhood of Maintenance of Way Employes. The tracks of the company are now patrolled by hundreds of special deputies. The strike leaders have small hope of arbitration. Their demands of increased wages and improved conditions have been rejected by President Truesdale, of the railway company. The strike order affects the entire system, from Hoboken, N. J., to Buffalo, N. Y.——"Unless a settlement is made by the General Grievance Committee of the car workers' union by Wednesday the car workers, boilermakers, machinists, blacksmiths, and possibly trainmen will be on strike thruout the entire Atlantic Coast Line system by Thursday night," was the statement of J. E. Dunlop, president of the car workers, at a meeting held September 16, after 362 car workers had walked out at Rocky Mountain, N. C. Car workers are on strike also at Charleston and Florence, S. C.; Waycross, Ga., and at other points.——Twenty labor leaders and former employes of the Pittsburgh, Butler, Harmony & Newcastle Electric Road have been indicted at Butler, Pa., on the charge that they caused the dynamiting of trolley cars during a strike against the railroad company.—— A strike of 8,000 workers in the tailoring trade, at New York City, was declared last week, but the outlook for arbitration of their grievances is highly favorable. ——Nine deaths and fourteen serious injuries resulted from an accident in an automobile race at the State Fair grounds at Syracuse, N. Y., September 16.

**The Canadian Elections**

Canada votes for members of the Dominion Parliament, and thus on the reciprocity agreement, September 21. Tho the campaign has been keenly waged for some weeks now, official nominations were made only September 14. Henri Bourassa, who has bitterly attacked reciprocity during the present campaign, has entered an action for $10,000 damages for libel against L. A. Rivet, Liberal candidate in Hochelaga. The suit is the result of alleged statements to the effect that Mr. Bourassa was subsidized to the extent of $200,000 by the Conservatives and Orangemen of Ontario. The money was supposed to be devoted to the interests of *Le Devoir*, the official organ of the French Canadian Nationalists. "I have never had a fight so insidious and dishonest as this," Sir Wilfrid Laurier recently told a meeting at Beauce Junction, P. Q. In part, at least, he was referring to the Conservative party's misrepresentation of the terms of the reciprocity agreement, and strenuous efforts to stir up a bitter anti-American sentiment. It was announced (September 16) that M. Leduc, Conservative candidate in Quebec East, Sir Wilfrid's constituency, had withdrawn from the contest. Later in the day this telegram was made public:

> Conservative Candidate Leduc opposed to Laurier makes solemn declaration that he was drugged last night, and while under the influence was induced to sign resignation papers. He now repudiates resignation. Big scandal. Prominent men will be arrested Monday. CHAS SMITH,
> Secretary Quebec Conservative Association.

Leduc later made a statement that a member of the Quebec Legislature and two other men paid him $5,000 to sign his withdrawal as a candidate. A promise of a Government job for Leduc was also made, it is asserted. Sir Wilfrid's name has not been connected with the case, but the Opposition charges his supporters with adopting desperate tactics to remove the rival candidate from the field. As we go to press it is impossible to estimate the gravity of the incident, or to arrive at its real significance.——Both sides affected confidence as the elections drew near. Betting odds favored the Liberals and reciprocity, however. If the Liberals win by a reduced majority, the Conservatives will demand another appeal to the electorate on that one issue.

**Panama Canal**

At the next session of Congress the canal tolls will be fixt by legislation. It is expected that much support will be given to a movement in favor of free passage for American ships going from one coast of the United States to the other. Transcontinental railroads may oppose this, and there may be an obstacle in existing treaties.——The Tenth Infantry has been ordered to the Canal Zone, to serve as part of a permanent garrison.——According to a new census, the population of the city of Panama is 35,368, and 7,008 of the inhabitants are white. Colon's population is 17,746.——All bids for the construction of the Panama and David railroad have been rejected by the Government because they did not comply with the specifications. They came from American syndicates, and two weeks have been allowed for the submission of new ones. ——A new steamship company, capitalized at $15,000,000, has been formed at Trenton, N. J., by Bernard N. Baker and four other former officers of the Atlantic Transport Line (now owned by the International Mercantile Marine Company) to take advantage of the opportunities offered by the Panama Canal and the mail-pay subsidy granted by the Post Office Department. This company will build fifteen fine steamships for service from New York and New Orleans to Colon and from Seattle and San Francisco to Panama. There will be continuous passenger service from New York to San Francisco, at about two-thirds of the present railroad charges, and freight from coast to coast will be carried at rates much lower than those of the transcontinental railroads. It is said that the reduction may amount to $10,000,000 a year on shipments of oranges and lemons from California. To insure the independence of the corporation, it is provided that no one connected with a competing railroad or steamship company shall be made a director. Trade from coast to coast now amounts to about 4,000,000 tons a year.

**The Situation in Mexico**

The anniversary of Mexico's independence was celebrated on the 16th. Riots were expected, but in only two or three places was there any disorder. In Monterey, however, there were riots and three men were killed when cavalry charged the mob. Prior to the 16th there had been several collisions between Maderists and Reyistas. President Francisco de la Barra has sought to preserve order by means of a joint commission in which each of the two candidates is represented by three persons. This commission strives to prevent campaign methods which excite the people. General Huerta is still pursuing Zepata, who has been joined by Juan Almazan, a boy general of twenty-one, who promises to raise an army of 10,000 in four States near the capital, where there are some who fear he can do this.——The Reyistas are striving to induce Congress, which assembled on the 16th, to postpone the election for six months or a year, asserting that a fair and peaceful election cannot now be held. Postponement would help Reyes. His convention made no nomination for the vice-presidency, but petitioned Congress for postponement. Whereupon Madero sent a protest, saying that postponement would be regarded by the people as betrayal of their cause. Maderists say that if the election is deferred they will take up arms again. Reyes has the support of business interests, but is hated by the common people. Madero has won the Catholic party, which originally was for Reyes, but has lost something by the Gomez defection in the revolutionist ranks.——In the Maderist convention, Dr. Francisco Gomez (beaten for the vice-presidential nomination by Suarez) was called a traitor. Defending himself, he has published telegrams and letters tending to show that in the Juarez peace negotiations he came to the rescue, answering appeals of Maderist generals, when Madero, outgeneraled by Limantour, was about to consent that Diaz should remain in office. But he does not say that Madero was financed by the Standard Oil Trust or any American syndicate. He denies that any support of this kind was given.

**Food Riots and Strikes**

The epidemic of disorderly manifestations against the high cost of living now sweeping over Europe reached Vienna on Sunday, when some 200,000 men and women assembled in various parts of the city to demand that the Government permit the importation of foreign meat and adopt other measures to reduce the prices of the necessities of life. The largest body assembled before the Rathaus, and after listening to the speeches, indulged in stone throwing and window breaking. Troops were called to the scene and were greeted with the cries, "Give us bread; not soldiers." Three times the cavalry charged thru the streets, using their swords, and many persons were wounded and several killed. The Socialist party, which in the recent anti-military demonstration at Berlin has shown remarkable ability in the orderly handling of crowds, refused in Vienna to relieve the police of that responsibility. While the rioters were tearing down the palisades of the Rathaus Park, the Socialist leader, David, tried to calm them, but they attacked and beat him so that he had to be carried to the hospital. The city has been put under martial law. ——The French Government is endeavoring to put a stop to the food riots by the double method of punishing offenders and adopting remedial measures. Prompt action has been taken in the courts, and some of the men who attacked the soldiers have been condemned to several months' imprisonment. Premier Caillaux announces that the Government will introduce a measure for the establishment of municipal butchers and bakershops and lodging houses, which, it is hoped, will tend to keep down the cost of food and rent. The mayors in many French towns have already established food stores or have issued a tariff of maximum prices. The president of the Municipal Council of Paris convened a meeting of the leading dealers in food products in order to discuss the best means for counteracting the rise in prices. The centers of the original disturbances are now comparatively quiet, but the agitation is spreading to all parts of France and attacks upon the markets by housewives and hoodlums are numer-

ous. The General Confederation of Labor, the head of the syndicalist movement, is endeavoring to foment revolutionary disturbances in Paris. In Belgium conditions are similar to France, and in Russia, where the cost of living has increased 50 per cent. in the last few years, serious distress and disorders are apprehended.——Strikes in Bilbao, Santander and other cities on the Bay of Biscay have developed into serious disturbances. A railroad strike originating in Dublin over the handling of boycotted freight has involved the whole of the Great Southern system and is likely to bring about a renewal of the trouble on the English roads.

**Stolypin Shot**

The Russian Premier was fatally shot by an assassin in the presence of the Czar at a gala performance of grand opera at Kiev on September 14. The imperial visit to Kiev was intended to demonstrate the re-establishment of internal peace and order and the most elaborate precautions had been taken to make it safe and successful. The Czar had in the afternoon witnessed the army manœuvers and later reviewed 4,000 boy scouts in the hippodrome. The entertainment in the evening was the patriotic opera and ballet "Czar Soltan," and during the intermission, near its close, a young man in evening dress moved quietly down the aisle to the seats next to the orchestra, where Premier Stolypin was seated with other members of the Cabinet, and shot him twice, the revolver being concealed in his program. One bullet entered the right breast of the Premier and the other he caught upon his right wrist. The Premier instantly stood erect, faced the royal box, and with his wounded arm made the sign of the cross toward the Czar. Then he took off his uniform coat unaided. Emperor Nicholas rose to his feet on the sounds of the shots and, going to the front of the box, directed the orchestra to play the imperial anthem, which was repeatedly sung by the performers kneeling upon the stage until the excitement of the audience had been quieted. The Premier was carried to the hospital, where, after an examination of his wounds, he asked to have a message sent to the Emperor, "Tell him I am ready to die for him." The assassin, Pershkevish, is a Jew by birth, who has in recent years under the name of Demitri Bogrof been playing a double rôle, being in the service of both the secret police and the revolutionists. Admission to the opera was strictly limited to those who had received invitations or cards from the police. Bogrof secured entrance by going to Colonel Kuliabko, chief of the Kiev secret police, with the story that an attempt would be made on the evening of the opera to assassinate Premier Stolypin and that the Central Revolutionary Committee had delegated a woman, Nina Alexandrovna, to perform it. Colonel Kuliabko took him into the theater in person and gave him a seat where he could watch for the alleged terrorist. He intended to approach the Czar, but not being able to enter the imperial box, he shot the Premier. Before he could escape he was seized by the auditors and badly beaten before the police could take him in charge. The Premier died on Monday evening. Stolypin was appointed Premier in 1906 and has retained his position thru imperial favor in spite of opposition from both sides. The court clique disliked him because he was a self-made man and has interfered with their corrupt and inefficient management of affairs. The revolutionary party hated him because he has completely crushed their movement and rigorously repressed disorders of all kinds. The laws against the Jews have of late been enforced with the greatest severity and caused widespread distress. Many attempts have been made against his life, the most serious being that of August 25, 1906, when the front part of his house was destroyed by the explosion of a bomb during a public reception.

**The Morocco Question**

The tone of public opinion has been distinctly optimistic during the week, especially in Germany, altho no agreement has yet been reached and the public has not been informed as to the progress of the negotiations. The action of the French and English financiers in withdrawing many millions of dollars

from the German banks within a few weeks has doubtless been the most important factor in checking the war spirit. Special significance attaches to the speech of Herr Bebel at the Social Democratic Congress in Jena, because it has been a serious question whether the loyalty of the Socialists could be relied upon in time of war. The French Socialists have long been in favor of a general strike of all workingmen upon the signal of a declaration of war and plans have been openly discussed for stopping trains, breaking up railroads and cutting telegraph lines in order to prevent the mobilization of troops. But as Herr Bebel stated, the German party has never advocated a general strike in case of war. It would, he said, be an absurdity. The Social Democrats would do their best to prevent a war, but if it occurred they would do their utmost to bring it to an end as soon as possible and would then avail themselves of the political and economical crisis which must follow to abolish the ruling of class and the reign of capitalism. He did not think that a victory over France would be so easily gained as in 1870 and, at any rate, Morocco was not worth the bones of a single Prussian grenadier. A resolution was adopted by the Congress denouncing the war and demanding that the question be laid before the Reichstag. ——The Italian Government is preparing to assert its old claim over Tripoli. According to reports it has offered Turkey $12,000,000 for freedom to establish an Italian protectorate over Tripoli, and that in case of a refusal a military expedition of 25,000 troops, backed by the navy, would be sent to Africa.

**Etna in Eruption**

Mount Etna is more active than it has been for many years, and the towns on its slope are threatened with disaster. The top of the volcano is enveloped in thick clouds of smoke, and earthquake tremors and explosions are incessant. The ashes thrown up into the air have covered the streets of Catania and have been carried by the wind as far as Malta and Africa. New cones, 65 to 100 feet high, have formed about the craters. Lava rising from a hundred new vents is flowing rapidly down the mountain side toward the north, filling the valleys and pouring over the crests of the foothills. The main stream, several hundred yards wide at the top, divides into five further down, and has reached the railroad encircling the base, between the stations of Linguaglossa and Randazzo. Houses, vineyards and forests have been swept away, and the inhabitants of the villages have fled from their homes, carrying with them their farm animals and as many of their household goods as possible. The damage done so far is estimated at $20,000,000.

**Insurrection in China**

The rising in the province of Sze-Chuan is assuming serious proportions and the capital Cheng-tu is closely besieged by the rebels. The cause of the outbreak is the popular opposition to the foreign construction of railroads under the loan agreement accepted by the Chinese Government last May. According to this, financiers of four Powers, Great Britain, Germany, France and the United States, are to furnish $50,000,000 and 1,200 miles of railroad were to be constructed under foreign engineers. Our Government insisted upon participating and the westernmost section, extending into the province of Sze-chuan, was assigned to the Americans. But the Chinese have become awakened to the value of such franchises and to the dangers to national independence involved in such loans, so there sprang up, especially in the south and west, a strong movement in favor of the development of the natural resources of the country under native control. At Cheng-tu a company had been formed and had undertaken the construction of a railroad from Ichang in the adjoining province of Hupei to the Sze-chuan border, which would conflict with the American project. The Viceroy arrested on September 7 the ringleaders of the movement, including the president and vice-president of the provincial assembly, and threatened them with decapitation. This infuriated rather than pacified the people and a few days later the yamen or official residence of the Viceroy was attacked by a mob and the soldiers defending it killed forty of them.

# The New Arbitration Treaty with Great Britain

BY HON. RICHARD OLNEY

[We have asked the distinguished ex-Secretary of State under President Cleveland to write us his views on the proposed arbitration treaty with England. The author before his appointment as Secretary of State served as a member of the Massachusetts House of Representatives and as Attorney-General of the United States.—EDITOR.]

PRESIDENT TAFT'S public declaration of his conviction that there was no sufficient reason why an arbitration treaty between nations should not include all questions whatever, coupled with the intimation that the United States and Great Britain should lead in making such a treaty, was hailed by a great wave of enthusiasm on both sides of the Atlantic. The indorsement of English statesmen was no less marked than that of the English people, who joined the American people in the belief that the President's splendid initiative would be followed by practical results of commensurate value. There is no doubt that, upon the publication of the terms of the treaty as negotiated, there was a keen feeling of disappointment in both countries. It was seen to fall far short of the President's proposition—how and for what reason was not and is not evident and has not been explained—and there were critics who ventured to question the President's sincerity and to suggest that after all he had simply been playing politics. It was further seen that the new treaty approached the ideal of President Taft even less nearly than the unratified treaty of 1897. That treaty did send all disputed questions to arbitration, tho upon such as involved vital interests, territorial integrity, honor, etc., there could be no absolutely binding award except by at least five of the six judicial arbitrators. The treaty of 1911, on the other hand, in effect reserves those same classes of questions from compulsory arbitration and subjects them to it only if a commission of inquiry shall so decide. The first feeling of disappointment at the terms of the treaty of 1911 has now much abated, and both in England and America there is a general desire that the treaty as negotiated shall not fail of consummation. If not realizing all the expectations raised by President Taft's utterances, it is believed to be at least a decided step toward the final goal. But the treaty as negotiated now encounters a serious obstacle in the necessity for its ratification by the American Senate. Its power over treaties has been so often used with deadly effect that it comes as a surprise that the terms of the treaty of 1911 had not been informally submitted to and approved by the Senate in advance of the completed negotiations. Such seems to be the fact, however, with the consequence that, as the matter stands today, the Senate is unwilling to ratify without a change which eliminates its most important feature. The treaty provides for a "Joint High Commission of Inquiry" to investigate, at the request of either party, any arbitrable controversy in advance of arbitration, and also to investigate any other, whether arbitrable or admitted to be arbitrable or not. There is also to be submitted to this commission any disagreement of the parties as to whether a particular controversy is or is not arbitrable under the treaty. The composition of this commission is criticised by the Senate and certainly seems to be lamentably indeterminate. An initial provision that it shall consist of three nationals from each party is immediately modified by the following:

"Or the commission may be otherwise constituted in any particular case by the terms of reference, the membership of the commission and the terms of reference to be determined in each case by exchange of notes."

It is not wonderful, therefore, to find the Senate committee characterizing the commission as one that "may consist of

one or more persons, which may be composed wholly of foreigners or wholly of nationals." What is legally possible under the terms employed may be fairly objected to, however unlikely to happen in practice. But the most serious objection of the Senate to the treaty as negotiated remains to be stated. Under Article 1 all differences between the parties (a) as to international affairs in which they are concerned; (b) by virtue of a claim of right made by one against the other under treaty or otherwise; and (c) justiciable in their nature by reason of being susceptible of decision by the application of the principles of law or equity, are arbitrable. This phraseology is of the broadest, covers all justiciable controversies, and excludes all non-justiciable. In the non-justiciable class come of course the controversies which touch the honor, independence, vital interests and governmental policy of either country. But, as the parties may not take the same view of the line between the two classes, and may disagree as to the side of the line on which a particular case falls, the treaty undertakes to settle the difference by the following provision:

"It is further agreed, however, that in cases in which the parties disagree as to whether or not a difference is subject to arbitration under Article 1 of this treaty, that question shall be submitted to the Joint High Commission of Inquiry; and if all or all but one of the members of the commission agree and report that such difference is within the scope of Article 1, it shall be referred to arbitration in accordance with the provisions of this treaty."

The Senate's objection to this provision is that it amounts to a delegation of its share of the treaty-making power to a delegation which it ought not to make, and can not constitutionally make. That it can not delegate the power is too plain for debate, and the one question is—would this provision operate as an attempt at such delegation? Senator Root answers "No," and with his customary acumen argues that the commission is not given power to say what shall be arbitrated, but merely "to find whether the particular case is one that the President and Senate have said shall be arbitrated." The whole argument against the Senate's contention is thus compressed into the fewest words and could not be put more lucidly and effectively. Yet, if carefully examined, it can hardly be deemed satisfactorily to meet the Senate's position. Its inherent infirmity is shown by the very case the Senator relies upon as parallel, namely, that of a Congressional statute imposing a duty on some imported goods and not on others and leaving it to the customs officials to determine which goods are dutiable. But the matters thus left to customs officials to settle are not matters of law, nor of mixed law and fact, but matters of fact and of detail only. The judgment and discretion concerned in settling them is practically negligible, and they are supposed to be as easily susceptible of determination by exact and well known standards as is the existence of the goods. It seems impossible to treat such matters as being on the same plane with the subjects of a submission to the Joint High Commission of Inquiry—subjects which are certain to involve both international and municipal law, to turn upon considerations of national sentiment and national policy, and to call for the use of all the resources of the highest and most expert statesmanship. The same rules which are applicable to the ordinary private trustee govern the use of the treaty-making power by the Senate, which in its collective capacity is trustee of the power for the entire country. The private trustee can perform purely ministerial and administrative acts by deputy—he can not perform by deputy acts involving judgment and discretion because those acts involve his personal qualities and characteristics, which in the nature of things are non-transferable. On the like grounds the American Senate's power to determine whether a controversy is arbitrable cannot be transferred to a commission because the latter body in its nature and composition necessarily differs from the Senate, and the latter's qualities and characteristics are not transferable. It is noteworthy that in the complete uncertainty as to the make-up of the commission and as to its possible action in any given case Senator Root does find a real objection to the commission, which he says may draw a line to suit itself instead of observing the treaty line. But, if that objection be well taken, is it not demonstrated that to such a commission the Senate ought not to

delegate any of its treaty making power even if it has the right to do so? The Senator undertakes to dispose of the objection by proposing, as a precautionary measure, that the treaty be signed with a rider excluding from arbitration questions touching the traditional attitude of the United States concerning American questions or other purely governmental policy. But, with such a rider, would the treaty be worth ratifying?

The Senate might have been asked to consent to a treaty with Great Britain which would send to arbitration all questions without exception. The Senate might have refused its consent, not for want of power, but upon grounds of policy and expediency. It might have given its consent and, having done so, must in good faith have assented to any subsequent agreement or proceeding requisite in a given case to make the treaty effective. What the present treaty in substance does is to ask the Senate to consent that certain classes of controversies shall be arbitrable in any event and that certain other classes, even if denied to be arbitrable by the United States, shall nevertheless be arbitrated if a commission so decides. It must be acknowledged that the position of the Senate that it ought not to give such consent and cannot constitutionally give it would seem to be correct. It is not shaken by the circumstance that every arbitral agreement made in a particular case under the treaty must be consented to by the Senate. Having once ratified the treaty, the Senate could not thereafter decently withhold its concurrence in any agreements and proceedings appropriate and necessary to the fair and full execution of the treaty.

Boston, Mass.

# French Canada in Dominion Politics

BY EDWARD PORRITT

THE great importance of Quebec and the French Canadians in Dominion politics is not a matter of this year or last. It is much older than Confederation in 1867; and altho union was inevitable from within thirty years after the American Revolution, it was the peculiar position held by Quebec in the old days of the United Provinces that forced the issue and had much to do with bringing about Confederation. From 1792 until the Papineau rebellion of 1837, Quebec was a self-contained Province, with its own Governor-General and its own legislature. It had no more to do with New Brunswick, Nova Scotia and Prince Edward Island, the British North American Provinces to the eastward, or Ontario to the westward, than it had with New Hampshire or Massachusetts. In those days it was known as Lower Canada, and what is now the Province of Ontario as Upper Canada.

To a large extent the United Empire Loyalists formed the first inflow of population into Upper Canada after the peace of 1783. Comparatively few Loyalists went into Lower Canada. There was little in the rural and land economy, or, outside the cities of Montreal and Quebec, in the social and ecclesiastical conditions, to attract either the United Empire Loyalists or settlers from England, Scotland and Ireland to Lower Canada. The few British immigrants who did get into the St. Lawrence country and did not pass westward into Upper Canada, stayed either at Quebec or Montreal, and went into business, or into such professions as could be exercised among the English-speaking population of these cities. For the rest, British immigration into Lower Canada—certainly such immigration as settled upon the land—consisted either of soldiers, who were disbanded at the end of the long war with France in 1817, or immigrants who came out under the auspices of a British colonization company, that about 1820 set-

tled what are known today in the Province of Quebec as the Eastern Townships.

Outside of Montreal and Quebec and the Eastern Townships, Lower Canada, up to the time of Papineau's rebellion, was essentially French. The old seigniorial system of land tenure still survived, and in every parish the Roman Catholic Church was dominant, and even more fully established in some respects than the Anglican Church in modern times in England. French Canadian bishops were members of the Legislative Council at Quebec, and were treated there with as much deference as bishops receive in the House of Lords; and in the parishes the curés of the Roman Catholic churches were supreme. But the English-speaking population of Montreal and Quebec was dominant in the Legislative Council and in the Legislative Assembly at Quebec. English-speaking Canadians monopolized about all the offices under the Government that it was worth a man's while to hold; many of the laws were in the interest of the English-speaking merchant and professional classes; and the idea of these people from Great Britain was that the French were a conquered people.

SIR WILFRID LAURIER TODAY
The Premier is the first French Canadian to attain the highest office in the gift of Canada. He is now in his seventieth year, but as active as ever

It was these conditions, coupled with the amazingly wooden management of all the British North American Provinces at this time from Downing Street, London, that brought about the rebellion of 1837. In Upper Canada at this time a comparatively small group of United Empire Loyalists—infinitely more Bourbon Tory than the Tories who had supported Pitt and the other Tory Premiers at Westminster from 1784 to 1829—were in easy control at Toronto, and were collecting all that could be drawn their way, with little regard to the people who were not of their clique, and, as time went on, inattentive to the behests of colonial secretaries in London. Loyalty to the monarchical idea and to British institutions was never more capitalized than by the Tories in control of the Government of Upper Canada from about 1820 to 1837. These Tories were the governing class of Upper Canada; and in meal or in malt they exacted a pretty heavy toll from the people whom they governed.

The Mackenzie rebellion in Upper Canada came at the same time as the Papineau rebellion in Lower Canada; and if ever rebellion can be justified, justification is possible for the rebellions led by Papineau and William Lyon Mackenzie. Theirs was the lot of rebels who do not quite succeed in effecting a revolution. Both Mackenzie and Papineau were for ten years refugees in the United States; but today there are monuments in Canada to them both—monuments the cost of which came out of Government treasuries; and the new and better era in British colonial history—the era to which belong the great dominions of Canada, Australia, New Zealand and South Africa—took its inception immediately and directly out of the rebellions in Upper and Lower Canada in 1837.

It was not possible in the settlement that followed these rebellions—the settlement in which the Earl of Durham and Lord John Russell earned their high place in British colonial history of the nineteenth century—to effect a union of all the Provinces. The obstacles were too great in 1840 to admit of Prince Edward Island, Nova Scotia and New Brunswick coming into a confederation with Upper and Lower Canada, as they did in 1867. Moreover, conditions did not seem to the statesmen and the Parliament at Westminster favorable to Quebec and Ontario continuing as separate and self-contained Provinces. There were difficulties, arising chiefly out of the fact that the St. Lawrence was the gateway from the Atlantic Ocean to both Upper and Lower Canada. At one time it was suggested that a third Province might be created, consisting of the Island of Montreal. Here, however, there were difficulties that seemed insurmountable; and so, by the British Act of 1840, the United Provinces were organized under one government, with a legislature that should hold its sessions alternately in what now became the Provinces of Quebec and Ontario.

The team from the first was glaringly ill matched. It never ran well together. There were no grounds in 1840 for expecting that the team would ever be serviceable, for, except for the English-speaking Canadians of Montreal and Quebec and the Eastern Townships, all that French Canada had in common with Ontario was that it was on the North American continent, that it was under the British flag, and had been governed by means of representative institutions closely patterned after the Westminster model.

The population of Quebec in 1840 was much larger than that of Ontario. But one of the conditions of union that Ontario had insisted upon was that both Provinces should have the same number of representatives in the legislature. Later, with the immigration from England and Scotland of the middle years of the nineteenth century, the population of Ontario became larger than that of Quebec; and for years before confederation the cry at elections in Ontario was representation by population. This cry, of course, made no appeal to the electorate of Quebec. Quebec was satisfied with this part of the settlement of 1840, and at no time between 1841 and 1867 were elections in Ontario and Quebec fought on the same issues. French Canada was tenacious of the great privileges of its Church under the Constitution, and also of the privileges which it had drawn to itself from the beginning of the United Parliament as regards use of the French language in both chambers and in all official documents, and its share of all political offices and patronage—for next to the Irishman, no man prizes a government appointment more than a French Canadian.

A Government, in order to obtain a majority in those days, had to secure the support of both English and French speaking members. Much intrigue characterized the formation of governments; and almost from the beginning to the end of the union in 1867, a Government at Quebec or Montreal, or at Toronto or Kingston, was not known, as governments are today, by the name of its Premier, but by the names of the leaders of the English and the French members who joined forces to form an administration. These were the days of governments with hyphenated names—the Brown-Dorion and the Macdonald-Sicotte administrations, for instance. They were the days of double shuffles and discreditable intrigues, which have unfortunately left permanent marks on the political civilization of Ontario and Quebec—as, for example, in the separate school system of Ontario; and it was because, toward the end of the period of 1841 to 1867, these deals and shuffles were becoming intolerable, because as a result of them administrations were in power today and out tomorrow, and the instability of governments was becoming unendurable, and the union of 1841 seriously threatened, that the larger union of 1867 was brought about.

The hyphenated governments of 1841-1867 came to an end at confederation. There have been only six Premiers at Ottawa in the last forty-four years—Macdonald, Mackenzie, Thompson, Tupper and Laurier; and Laurier is the only French Canadian who has been at the head of the Dominion Government. But the French Canadians lost little at confederation, for most governments, since

1867, whether Conservative or Liberal, have been dependent on Quebec, which has 65 members in the House of Commons as compared with 86 from Ontario and 69 from the remaining Provinces.

Coalitions of English and French speaking members to support administrations to be known by the names of the leaders of the two groups disappeared with the incoming at the union of the Provinces to the east and west. But much the old arrangement has been continued as regards portfolios in the Cabinet and offices in the civil service. At least two portfolios always go to the Quebec supporters of the Government. One of these is invariably that of Minister of Marine and Fisheries—now also responsible for the Dominion Navy—the department which expends most of its large appropriations at Montreal, Three Rivers, Sorel and Quebec, and other centers of its activities on the St. Lawrence. The other portfolio that goes to a French Canadian is usually that of Minister of Public Works or of Minister of Railways. These are both great spending departments, with much patronage at the disposal of the Minister.

In the House of Commons the rule is that the Speakership must go in one Parliament to a French- and in the next to an English-speaking Canadian; and when an English-speaking member is in the chair, the chairman of committees or Deputy Speaker must be a French Canadian. The same rule applies to the clerk and the deputy clerk of the House; and in the Senate to the Speaker, and to the clerks at the table. In the library of Parliament there must be both an English-speaking and a French Canadian librarian, of equal rank and equal pay; and a similar division of the assistant librarian positions. The appropriation for the purchase of books also must be divided between books in the English and the French language. In the civil service, when a clerk is desirous of promotion into the next grade, he must, if he wants his promotion expedited, find a French Canadian of the same grade, and then both move forward to higher dignity and higher pay.

Most of the French Canadian members can speak English; but they value highly the privilege of addressing the House in French, and often avail themselves of it to ensure that it shall be kept actively alive. If a question is asked of a member of the Cabinet in his place in the House of Commons in French, courtesy demands that the reply shall be in French. All the orders of the day, all reports of state departments that are submitted to Parliament, are printed in English and in French, no matter how voluminous or how costly. All bills also are printed in both languages, and should a bill fail to be so printed, the likelihood is that a French Canadian would avail himself of his privilege of delaying progress on the bill until it has been so printed. The Hansard, which corresponds to the Congressional Record, is published daily in both languages, and all the notices on the doors of offices in the Parliament Building are similarly in English and in French.

French Canadian politics are usually the politics of Quebec. The larger issues of Dominion politics—except at times like the present, when reciprocity is so much to the front—arouse little interest in the French Province. The privileges of the Church, the power it exercises over the marriage laws and over the public schools, with the usual struggle for offices and patronage, in the main constitute the politics of Quebec. Parties are nominally Liberal and Conservative, following the dividing line in the eight English Provinces. Conservatism is the essence of the politics of the Roman Catholic Church in Quebec. Liberalism is merely a name with most French Canadians; for Liberalism, as it is understood in England, can find no hold in a Province where the Church is so dominant and where all the politicians must be in harmony with the Church or risk its antagonism.

Laurier is the greatest of French Canadians who have been in Dominion politics; and it is Laurierism, as distinct from Liberalism, along with his extreme care for the Church during the last fifteen years, that gives the Premier his power in the Province of Quebec. Of recent years Laurier has been assailed by Henri Bourassa, who is a grandson of Papineau. Until 1899 Bourassa, who is quite as much an orator as Laurier—an orator and journalist and publicist

of the type much admired by French Canadians—was one of Laurier's most enthusiastic supporters in the House of Commons. He broke away from Laurier when the Government sent the Canadian contingents to help the British in the Boer war, and since then Bourassa has been endeavoring to build up a French Canadian Nationalist group. His last attack on Laurier is over the new Canadian navy, but there is little in Bourassa's program that appeals even to the French Canadians, and nothing that makes any appeal to Canadians in the other Provinces.

HAMILTON COLVIN

# The Personal Equation in Germany

BY POULTNEY BIGELOW

[The present uncertain situation in Germany makes this article of especial value. Mr Bigelow is well qualified to write of German character and thought. He is the author of "The History of the German Struggle for Liberty" and numerous other authoritative works.—EDITOR.]

THERE are three Germanies that I have in mind when approaching so complicated a subject as national character. First the outer Germany that we all can see on a first and flying visit—a Germany of beer mugs and broad-belted burghers; of swaggering officers and commercial travelers with ferocious mustachios, modeled on those of the paramount war lord; a Germany of innumerable uniforms and sausage and forbidding sign boards. These are the object of our first note—no traveler has failed to draw a gentle caricature after a first day on German soil—sometimes the caricature has come into print—more often let us hope it has been suppressed.

For two years I was member of a German family near Berlin, as a youngster preparing myself for the university; four years I kept house as bachelor in Munich working in a field of German history; two other years I lived in German Austria—and, indeed, scarcely a year of my life but has brought me to Germany into intimate social relation with Germans—sometimes the scholar, sometimes the politician, sometimes the peasant in the mountains or along the courses of canoeing streams; sometimes the soldier in the field of maneuver.

Let us pass from this external Germany to Home Germany—which will lead me to speak of Germany behind the veil, or might I call it Esoteric Germany, the Germany into which penetrate only the initiated. Germany of the Home is open to all such as show earnest desire to profit by German educational institutions, and this is best done when very young. It is in a German home that the pupil or guest little by little sees the details of the great machine which we call the life of a people. The German in general does not entertain in the English sense. You may invite your German friends to dinner, then wonder why you are never asked in return! Is it that the German dislikes you? Obviously not, or he would not accept your invitation. Is it that the German is not a sociable man? Quite the contrary. The German spends his leisure largely in social distraction—either the theater or with friends in conversation.

But the tradition of German society is one of poverty linked with loftiness of political, military or academic responsibility. Your German professor, or geheimrath or general in the army is the social peer of any in the realm, but this social aristocracy does not carry with it estates enabling him to compete with merchants, manufacturers and foreign diplomats and visitors who are usually credited with fabulous fortunes. Thus the stranger who marvels at the multitudes crowding the beer gardens of the

fatherland must learn that most of the tables he sees are occupied by husbands, wives and children who here arrange to meet their friends and kindred. He will learn that many of the tables are in the nature of club tables reserved for members of particular social groups—maybe a segment of some scientific body; maybe a student fraternity; maybe a regiment. To the German this beer garden represents a social factor of the first importance. The eye of the stranger sees the mass, but a nearer ken tells us that there is a vast social distinction between sitting at this table or that table—belonging to this group or that group.

When, therefore, a German invites you to join his table at a beer garden—where he presents you formally to his family or his friends, be not surprised that he permits you to pay for your drink and food, but rejoice that he is treating you to his best according to his lights.

The curse of our intercourse is the habit of "treating" as it is called—which means that whoever asks another to sit down with him for a chat must be burdened with paying for all that his guest chooses to drink or eat. The German knows nothing of this ridiculous custom and is consequently vastly more sociable. German poverty has been a notable factor in making of Germany as she appears to-day—it is an honorable poverty—the poverty which followed in the wake of twenty years of Napoleonic plundering (1792-1814). He who reads the history of those years with care will have in his hands a key to much that to-day puzzle the traveler.

German poverty has, to a large extent, made the institution of universal military service possible to-day and even popular. Napoleon left little in Prussia save hatred for his methods of rule. He stirred up in all classes a public sentiment which made possible the law that compels every man, rich or poor, peasant or noble, to serve in the army.

This institution now firmly rooted and widely fostered by the crown has been triumphantly vindicated at the bar of public opinion by marvelous successes in the war of 1870 against France, and to-day by Germany's forward position in commerce. The training which a rough peasant lad receives between the time when he doffs his civilian dress and the time when he graduates as a trim, wide awake, cleanly, and quasi educated citizen, is a training of more than military importance.

There is not an idle moment in the life of the German soldier nor an exercise that does not directly conduce to make him more supple, more practical and above all more alert intellectually. It has been my good fortune to be permitted to follow the military maneuvers of the German Army in every corps district of the Empire under the most favorable conditions—nor have I neglected those of other countries. From what I have observed it would seem to me that the cash value of the average country lad or laborer is enhanced 30 per cent. by an intelligent military service on the German plan. This service might be shortened in favor of lads who were already good rifle shots, or horsemen or professional experts in branches where military service might injure them—say violinists or engravers. But long or short there is room for believing that England (and still more America) would be much improved socially and industrially by adopting a rule that all citizens should for some period, if only a few weeks, be compelled to serve in the ranks. In this opinion I speak merely as a taxpaying and peace-loving citizen. Were I speaking as a professional soldier, I might discourage universal service. No doubt in case of invasion it is fair that every man, even every woman and child, should fight for fireside and family. The German system is based on the assumption that the Fatherland must be protected from invasion and that in such a war no sacrifice is too great.

But when it becomes a question of sending an expedition to strange climates, to shoot at strange people, in a country where there are no maps, and worse than that, no beer gardens!—then the question of universal service assumes another complexion. The triumphs of military Germany outside of her own or adjacent territory are not conspicuous enough to justify us in advocating this system unreservedly for either England or the United States. The character of the German is domestic. He loves his good bed—his congenial surroundings,

and when you send him away, he sings of home and loses courage. Your Tommy Atkins and your American "Regular" would rather move than not—he would rather shoot down Filipinos or Red Indians, Zulus or Dayaks, than hang about Woolwich or West Point. The "Regular" worries not over the destination of the transport—so long as there be ahead of him opportunities for fighting. Our regular or mercenary armies must remain the nucleus of our fighting forces and much of their remarkable strength lies in the fact that those who join would rather fight than eat.

One coward in the ranks can do more harm than two brave men can repair, and your average shopkeeper lad has no stomach for fight. When a youth in Germany, I was much struck by the peaceable quality of German boys as compared with those of Scotch, Irish and English pedigree, in whom fighting and sport gain in interest in proportion as they are dangerous. It is a safe to say that there are more black eyes, bloody noses and broken collar bones among our regiments in a week than in the whole German army in a year. The German is individually peaceful—and the universal service keeps him still more so. The German talks ferociously, and sings ferociously and makes ferocious drawings in his comic papers, but this ferocity is but a reminder that the German to-day is still tinged with barbarism. But the German is a healthy barbarian—a cultivated barbarian. The Prussian is the one I have now particularly in mind, whose ideals to-day appear to be largely associated with mere physical force or material progress. He is still a barbarian in the eyes of the Austrian, even the Bavarian. The Frenchman dreads his numerical superiority but smiles at him in the field of art or invention. Berlin struggles to be a German Paris—but except in mere number of uniformed soldiers and statues, she has far from reached the art level of Bavarian Munich.

Germany regards the officer as the culmination of all social endeavor. The War Lord is to them, if not the first gentleman of the land—at least the first soldier. You may have in your house the most distinguished scientist, poet, artist, priest or discoverer—yet socially you would have to rank him as inferior to the youngest soldier on the floor. The German lad cannot conceive of a gentleman without a uniform—or of God Almighty without a helmet and saber. The British soldier obeys his officer because the officer is a gentleman. The German officer must wear his uniform if he wishes to be treated as a social superior—he cannot understand how a British officer can command respect with or without uniform.

The third part of this little sketch brings me to the most difficult feature with which to deal—the esoteric or secret and initiated high priesthood—the Causa Causans in public affairs.

How explain the frenzied newspaper war upon England made by a land in which Shakespeare is acted more frequently than even Goethe or Schiller! How explain the persistent frightening of France by increased army budgets.

The world stands aghast at Germany straining her resources and incurring annual deficits in order to make a monster navy on top of a monumental army! Her leading soldiers, sailors, officials, scholars appear to regard it a part of patriotism to preach war against England. These fulminators of warlike menace are well received at court by an Emperor who personally preaches peace and who for now nearly a quarter of a century has maintained it. Meanwhile the indifferent tourist or student mingles freely with Germans and likes them individually—as Germans receive cordially individual English and Americans whilst hating their nations as nations.

The German character of to-day is a product of financial pressure and secondly of a marvelous docility on the part of the peasantry of north Germany whose blood is largely Slav.

The German nation since 1870 has grown to regard the government as the embodiment of human wisdom and human force—and no one who studies closely the marvelous manner in which Germany has solved many of the vexed problems of modern life can fail to appreciate her claim to confidence. Germany is a whole generation ahead of America in the treatment of problems

now vexing municipalities—the matter of good roads, cleaning of streams, nationalization of railways, state insurance, municipal ownership of public utilities—and many other semi-socialistic schemes.

The Government in Germany has at last won the confidence of the people and no wonder, for in Germany the state has courageously grappled with one thorny problem after the other, not in the spirit of the mere politician or partizan, but with scientific thoroness and energy.

As an instance, Germany has built a monumental ship canal from the North Sea to the Baltic, eighty miles and against great engineering obstacles. This was accomplished without advertisement or scandal, finished at the appointed day and opened without a penny unaccounted for.

The German associates government with honesty and efficiency and this confidence is rarely abused, so far as my knowledge goes. This reputation for efficiency and honesty has been built up by the initiated or esoteric German hierarchy, using that expression to represent the sacred and trusted body of leaders who move Germany to-day as did in ancient Egypt the initiated priesthood of Osiris and Isis or as India once swayed to the magic wand of the Brahmin. But the docility and faith of the German sometimes leads his sacred chiefs into error. For instance in 1896, this inner priesthood thought the time ripe for attempting something in South Africa and a telegram was sent to Paul Kruger which the uninitiated interpreted as meaning support to the Boer.

The blow was well aimed, but still better parried; and Germany at large rubbed its eyes to know what it was all about.

The Imperial priesthood had stirred German blood against England and at the last moment had avoided the conflict, and loyal Germany was puzzled.

Two years later Esoteric Forces in Germany made an analogous move in the Philippines while America was at war with Spain. The common people of Germany knew nothing of this but the Imperial official and initiated priesthood thought the time ripe to exert physical pressure upon the United States at a moment when the American admiral, Dewey, was much embarrassed for want of coal and a supporting army at Manila.

At this juncture Admiral Chichester, of the British navy, drew his ship between that of Admiral Dewey and that of Admiral Diedrichs—the German bluff was "called" and the Imperial German priesthood had to publicly explain the whole affair as a mistake—a mistake similar to the one which caused a telegram to President Kruger.

Two years after this, when England was at war with the Boers, the Esoteric Imperial priesthood sent down to South Africa an officer in German uniform who assured Boer leaders that Germany was friendly to them, and if only they would give some sign of winning victories there would be alliance between Kaiser and Kruger.

Esoteric Germany desires now to repudiate this. I have it from a Boer general whom I know to be honest, and I have from him the assurance that the war was prolonged at least one year by this message from Esoteric Germany.

During that war, the credulous people of Germany were by this Esoteric priesthood persistently encouraged to hatred against England. Clubs were organized in every city for the purpose of encouraging England's enemy; every Boer was feasted as a martyr or hero, and every English-speaking traveler regretted that he had not chosen some other field for recreation. But England once more called Esoteric Germany to account and her high priest once more had to confess his blunder—had even to refuse a public audience to Boer embassies!

Esoteric Germany still rules and forms what the outsiders see of German character. Esoteric Germany dominates the vast military machine of the country and has in her service the educational forces as well—the school teachers, the University professors, the vast body of officials who are loyal, plastic, scientifically trained. The high priest of this splendid hierarchy is the Emperor in Berlin, but he is no more a free agent than the Pope in Rome or any other chief of a great sacred order. He represents an esoteric

college, each member of which is selected after an initiation severe and complete.

The power of ancient Egypt resided in her temples. That was a time when high priesthood meant power, majesty and dominion in every direction—the priest was the man of science no less than war—of statecraft no less than letters and art.

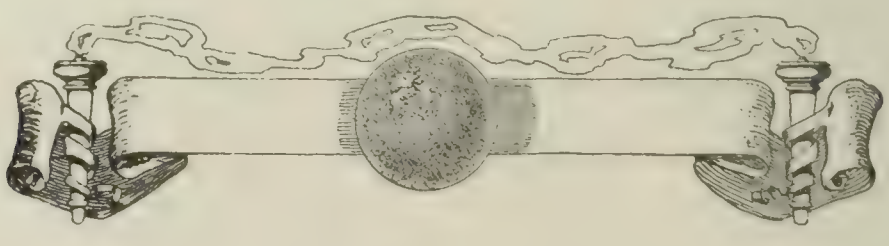
We of to-day think we are governed by the people—we are no more so than Egypt under the Pharaohs or New York under a Boss Croker or Boss Tweed. Germany has a free press, a free parliament and a constitution full of fine popular promises—so has pretty nearly every country in the postal union.

Yet at a given moment the whole complexion of the franchise can, in Germany, be modified by esoteric forces of which the voters have no ken; and the mighty Empire may be pushed into a war; a million men may march into bloody trenches without knowing of a single grievance to redress.

Esoteric Imperial Germany has three times in the past few years halted on the brink of war. Why did Esoteric Germany each time halt?

The High Priest of the inner temple knew well that he had all the necessary guns and ammunition—all the horses, transport wagons and pontoons—forage, blankets, boots and harness. What then caused this Imperial High Priesthood, this great Esoteric force, to stay the hand of the war herald?

The reason lies deep in German character! The Great Initiated Priesthood of Germany knows the character of the German peasant and artisan who masquerades as a bold guardsman.



That German recruit is none the less gentle for all his ferocious dress and drill. In time of peace he obeys cheerfully the political priesthood whose wisdom he recognizes. He will carry a knapsack and gun for weeks and months and years in blistering sun or furious norther, and never murmur so long as it be near to his home and in the holy cause of defending his home.

But ask that man to leave his soft bed and his sweetheart, his Munich beer and his music for the mere pleasure of fighting an enemy beyond the seas! That is a different matter. Esoteric Germany has made strange blunders of late in relation to foreign countries where much tactfulness is required no less than academic knowledge.

In regard to the character of her own people, however, the initiated priesthood is well informed. This Priesthood knows that the individual German, so far from hating the individual Englishman, looks to him as the man who gives him employment—who opens his ports and his homes to the emigrant German; who gives him equal justice wherever the British flag is unfurled. Esoteric Germany knows that her people emigrate cheerily to English-speaking lands and that they show little eagerness to enrich the territory branded by their Imperial Eagle.

Imperial—official and Esoteric Germany—is sore and restless, disappointed, jealous and eager for an opportunity to gratify national ambition. Her chief obstacle is the character of the German people. Esoteric Germany has trained a whole people to honesty, and thrift and cleanliness—to home virtues and love of family. Can she lead such a people into a career of military adventure—of predatory warfare? We venture to think not.

New York City.

# Psyche

BY ERNST HAECKEL

[Ernst Haeckel, the celebrated German biologist and most distinguished exponent of Monistic philosophy in Germany, was born February 16, 1834, at Potsdam. He studied medicine and science at Würzburg, Berlin and Vienna, and in the year 1857 was graduated at Berlin as M.D. and M.Ch. At the instance of Gegenbauer in 1861 he was chosen Extraordinary Professor of Comparative Anatomy and Director of the Zoological Institute in the same university. In 1865 he was appointed to a chair of Zoology, which was especially established for his benefit. This last position he continued to retain in spite of repeated invitations to migrate to more important centers such as Strassburg or Vienna, and at Jena he has spent his life, with the exception of the time devoted to traveling in various parts of the world, whence in every case he brought back with him a rich zoological harvest. About a year or so ago Professor Haeckel, owing to his advanced age and ill health, resigned his chair at the Jena University in order to pass his remaining days in the retirement of his home surrounded by the results of an extraordinarily fruitful scientific life. A study of Haeckel's philosophy by Dr. Edwin E. Slosson will be published in THE INDEPENDENT in a few months.—EDITOR.]

PSYCHE! Soul! What an immeasurable wealth of significant ideas are comprised in this one word! Few other concepts are so profound and full of meaning, and at the same time so diversified and complex, as the idea of the soul. The science of the soul-life, or psychology, is not only one of the most interesting and attractive of all fields of investigation, but is one of the most difficult and obscure as well. And notwithstanding the fact that in many thousands of books and treatises the subject has been explored in every direction, there is as sharp a contrast in the different views regarding the soul today as there was two thousand years ago.

If we set aside all secondary distinctions, the manifold ideas regarding the human soul may be brought into two large fundamentally antagonistic groups, namely, a dualistic and a monistic group. According to the older dualistic, or twofold view—which is still held by the great majority of mankind—the human organism is a double entity, consisting of a mortal body with an immortal soul, which inhabits it during life and leaves it at death. This teach most of the philosophers and theologians since Plato proclaimed in profound dialogs his dualistic metaphysics, and Christ, in the Gospels, his world-conquering religion.

The newer monistic or unific view of the psychic life, on the contrary, contends that man, like every other vertebrate animal, is a unific being in which body and soul are inseparably bound together. Our *psyche,* therefore, is not an independent being; but the collective idea of the sum total of life activity which, like all other functions of our organism, are regulated by the structure of the organs, and further by the work of the millions of microscopic cells which constitute these organs. This natural conception of the human soul, however, could not obtain widespread scientific acceptance until after the tremendous progress of natural science in the nineteenth century had placed at the disposal of investigators a mass of hitherto unknown empirical evidence.

The principal difference in these two hostile psychological camps I became acquainted with at an early age, when I began my academic studies at the Berlin University in 1852. It was brought to my notice especially, however, in the summer of 1854, when I attended the great Johannes Müller's lectures on comparative anatomy and physiology. The sixth volume of his classical "Handbook of Human Physiology" treats of the psychic life. The comprehensive survey of the entire field which the gifted master gave—equally significant in the exact as well as the comparative method of research—convinced me even then that natural psychology is a part of physiology. Compared to this view, how weak and unstable seemed to me the metaphysical and mystical conceptions of the human soul which I heard expounded at

the same time by the most prominent philosophers at the Berlin University! To recall this just now seems to me all the more allowable, inasmuch as at that time the most important proofs in favor of monistic psychology were still lacking and only gained a foothold—thru the modern teachings of evolution—after the death of Johannes Müller. The great biologist died on the 28th of April, 1858, a few months before Charles Darwin (July 1, 1858) published the first announcements of his "Origin of Species" on the basis of the theory of natural selection.

This is not the place to go further into the fundamental differences in the two psychological camps, which play such an important part in the modern dispute about a "conception of the universe" (*Weltanschauung*). It is my personal conviction that the monistic, or physiological soul-knowledge (*Seelenkunde*) long ago achieved, in principle, an intellectual victory, altho the powerful authority of the dualistic or mystic psychology, supported by previous traditions and the predominating forms of dogmatic religion, will retain for a long time its influence upon the widest circles. My views on the subject are presented in the second volume of my "Riddle of the Universe" (*Welträtsel*), chapters 6 to 11. As an old zoologist, however, I desire only to call attention to an analogy of the *psyche* to a species of insect which bears the same name, and which is, in many respects, of special interest—a curious butterfly of the "Sackspinner" family.

The ancient Greeks compared the soul to a butterfly. This was owing to the well known metamorphosis of the butterfly, the change of its creeping caterpillar into the dormant chrysalis from which the winged and perfectly developed insect comes forth. The poets discerned in this the analogy of soul transmigration and immortality. Originally the Greek word *psyche* signified the "breath of the wind," and, similarly, the human breath; as the soul flees from the body with the last gasp of the dying, Plato and his scholars saw in this the spiritual life of man. Hence the soul was represented as a butterfly by the sculptors, or as a lovely maiden with the wings of a butterfly. A rich source of poetry also was the personification of Psyche and her celebrated love for Eros. The beautiful poem of "Amor and Psyche" which Apuleius developed into a graceful fairy-story furnished the motive for innumerable works of sculpture. We need merely recall the famous and oft-copied marble group in the Capitoline Museum at Rome, which shows Eros and Psyche united in loving embrace, the beautiful plastic groups of Canova and Thorwaldsen, and the superb picture-cycle of Raphael in the Farnesine at Rome. The souls of the two lovers unite in the ecstasy of the kiss; therewith was indicated the sensual and at the same time the super-sensual being of *Psyche*.

Of a totally different character, on the other hand, is the Psyche of the entomologists, the remarkable species of butterfly to which the old entomolgist Schrank has given this systematic name. This delicate "soul butterfly" occupies one of the most humble and insignificant places in the long row of its colored and beautiful winged genera. The genus Psyche and some related species (Fumea, Epichnopteryx) comprise the small group of the Sackspinner (Psychinæ) and belong to the important family of the spinner (Bombycidra), which includes also the silkworm, processionary-moth, etc. The Sackspinners or Sack-carriers (Psychinæ) have received their name from the fact that the little six-footed caterpillars spin for themselves a sack or casing, the delicate silk wall of which is fortified with various foreign bodies spun into it, such, for instance, as bits of grass, wood splinters, grains of sand, etc. With *Psyche helix* the sack has the form of a spirally-wound snail shell (helix). The caterpillars of the Psychina carry this little house around with them while searching for their food on blades of grass and other plants (similar to the larvæ of the fly, Phryganide, which lives in the water).

The most remarkable phenomenon, however, in the life of these Psychinæ is their sexual dimorphism, the conspicuous difference in the two sexes. Only the male develops into a delicate butterfly, a few centimeters in size, the plain wings of which are mostly dark-colored and without markings. The fe-

male, on the contrary, is wingless and like a larva, a little worm without eyes similar to the larvæ of flies and bees. Also the little caterpillars which come forth in summer from the deposited eggs are different, both sexes spinning for themselves cases of different size and form. In the late autumn the six-footed little caterpillars attach their cases to a tree trunk or other protected spot, where they pass the winter. In the following spring they spin their cocoon inside this case.

After complete development the winged males emerge from the cocoon and fly about at will; the wingless, wormlike females, however, remain in the sacks all their lives and experience an involution—legs, feelers and eyes disappear; and, as with other butterflies, so also with these little Psychinæ, a specific odor is exhaled by the female which attracts the flying males at a considerable distance. Within the dark chamber or sack the fructified eggs are deposited.

Since the mythology of the old Greeks compared the *psyche* to a butterfly, it is now permitted to modern biology to use the above remarkable facts in the history of the development of Psychinæ as symbols of psychology. It sees in the two sexes of the Psychinæ an ingenious allegory upon the two antagonistic camps of soul knowledge. The winged males fly about far and wide, look at the beautiful world with open eyes and gather in experiences. They follow the ways of Psychophysics in its broadest sense, according to the empirical and monistic philosophy. The wingless females, on the contrary, seclude themselves from the outer world, lose the organs for its contemplation, and meditate, entombed in their case of wisdom, only about themselves and their inner existence. They remain captive to the introspective method of psycho-mysticism, the speculative and dualistic philosophy. They become fruitful only when they pair with the more highly developed male.

Still another very remarkable fact in the life of certain Psychinæ may be mentioned in conclusion. In the course of time, the fertilization of the eggs of various species of Psychinæ has gone out of fashion; the young brood develops from unfertilized eggs, and the male has therefore become superfluous. This parthenogenesis has also, without question, been proved in the case of numerous Articulata, especially with different families of insects and crustaceans. It never occurs, on the contrary, with vertebrates. But pure idealists may now produce as evidence the example of the highly developed parthenogenetic insects. If the profound "Pure Reason," as with the famous bachelor, Immanuel Kant, the chief of modern metaphysics, remain free from all seductions of Eros, it will remain, in proud self-sufficiency, encased in its unworldly speculative case or cocoon. But we are of opinion that not only the enjoyment, but also the deeper knowledge of life is far greater in an intellectual hero like Wolfgang Goethe, who looks with open eyes into all the depths of the world, and who penetrates, like a winged butterfly, not only into the perfumed heart of the flower but also into many secrets of life. Love always remains the crown of life. The pure and ennobled love of the two sexes is not only the necessary condition for the maintenance of mankind, but it is also, in both sexes, the impetus to the highest functions of the mind, to the most exalted and beautiful products of the *Psyche*.

[illegible] Germany.

STREET IN AGANA, GUAM

# Our Administration in Guam

BY HON. E. J. BORN

GOVERNOR OF GUAM.

[Our readers will be interested to know of the progress made in this distant possession since the American occupation thirteen years ago. The article is written for us by the Governor of the Island.—EDITOR.]

GUAM is not in the Philippines, nor in the Samoan Islands, nor yet in the West Indies, as the addresses on not a few letters seem to indicate. Guam, on the contrary, is a little American island, about thirty miles long and six miles in width, the largest and most southerly of the group known as the Marianas, and when the Stars and Stripes go up in the morning and down at sunset, to the strains of the national air, every one within sight of the flag stands erect during the playing of the "Star Spangled Banner" and reverently uncovers at the last note. Guam is distant from Manila, lying directly to the westward, 1,500 miles; from Yokohama to the northward, 1,350; from Shanghai, 1,400; from Honolulu, to the northeastward; from San Francisco, by the way of Honolulu, 5,540, and from Panama, by the great circle, 7,846 miles. To Saipan, the seat of the government of the German Marianas, is 125 miles. Lying in east longitude, its date is in advance of ours, so that a cablegram, sent from there to Washington at 11 p. m., on Monday, reaches the addressee at 8.20 Monday morning, and the reply, sent at the close of office hours, reaches the authorities of Guam on Tuesday morning.

The island was captured by the U. S. S. "Charleston," commanded by Captain Glass, U. S. N., on June 20, 1898, and ceded to the United States by the treaty of peace after the Spanish-American War. It had been a Spanish possession ever since its discovery by Magellan, March 6, 1521, on his famous voyage, during which he discovered also the straits which bear his name and the Philippine Islands. The first American enumeration, in October, 1901, showed a total population of 9,675 natives and permanent residents, while that of June, 1910, showed these to number 11,802. The naval establishment, officers, enlisted men and civil employees, a variable number, brought the total population up to 11,949. To the zeal and skill of the naval medical officers, of whom four are constantly attached to the naval station, and to the strict enforcement of sanitary regulations, the gratifying results are due, of a greatly reduced death rate and a marked improvement in the general health of the population. The annual

death rate shows a reduction of about seven per thousand, and the annual increase of births over deaths now averages about 245.

From the time of the first colonization, in 1668, to the date of its surrender, in 1898, fifty-seven Spanish governors, some good, some bad and some indifferent, have ruled in Guam, subordinate, after the independence of Mexico, and the withdrawal of the last Spanish viceroy, in 1821, to the Governor-General of the Philippines. After the passing of the sovereignty from Spain to the United States, the Island of Guam was, by executive order of President McKinley, dated December 23, 1898, placed under the control of the Navy Department, and has been maintained as a naval station ever since, with a naval officer as Commandant of the Naval Station and Governor of Guam. In 1899 the remaining islands of the Mariana group were sold by Spain to Germany for approximately $2,500,000.

Ever since the American occupation, the Federal Government has been liberal in its provisions for the maintenance of the station and each year's naval appropriation bill carries a sum quite commensurate with its needs and sufficient, in the hands of a careful administrator, to undertake improvements beyond the strict confines of the naval reservation, and beneficial to the island at large. It has thus been possible to rebuild certain old and practically abandoned roads, which in the past had been allowed to revert to jungle. Notable among these is the old Spanish road leading from the Agaña-Pitt road around the head of the Bay of Apra, sections of which had been lost in the mangrove swamp and became impassable. The general direction has been followed and an excellent highway now connects Agaña with the extensive Government tract at Sumay, leased to the Commercial Pacific Cable Company and upon which has been built the costly plant of the cable station. This road, passing thru a long stretch of mangrove swamp, crosses the Atantano River on a strong wooden bridge with masonry piers, built to replace those of the old Spanish structure destroyed years ago by earthquakes and typhoons. Its construction has given a new impulse to the cultivation of the largest rice tract in the island. With the annual allotment available for repairs, it will be possible to keep this highway in repairs for the ever increasing traffic between Agaña, the capital, and the towns of Agat and Sumay, and thru these with the smaller villages on the south and east coasts. While to the average native, who is of a simple, pleasure-loving disposition, this road represents merely an easier and more direct way of passing from town to town to his fiestas and fandangos.

The question of an adequate supply of wholesome water has occupied the attention of successive American Governors from the first days of the occupation. Their predecessors were content with the surface wells, which existed everywhere, but which were a source of evil to the extent that practically every user of the water suffers from internal disorders, some of a very serious nature. When it is remembered that Agaña, for example, was in existence as a village when the island was first discovered, and has remained its principal town ever since, containing now about 8,000 inhabitants, and occupies a flat tract, practically without drainage, it can be realized that these wells, receiving the seepage from the surface, contaminated by the refuse which, in the slovenly and unhygienic mode of life of the people, was thrown into the streets and public places, became a source of danger to the health of the community. Plans for a water supply system, based upon a careful study of the water shed of the hills back of Agaña, were made, in 1901, by a naval civil engineer and approved by the Navy Department, but the appropriation asked for to carry them out failed to pass, in Congress, until March, 1909, when the work was at once begun and pushed with vigor, and June, 1910, witnessed the turning on of the water service. A reinforced concrete dam, built near the head waters of a mountain stream, impounds an ample supply of good, wholesome water, which is conducted thence thru nearly three miles of six-inch pipe to a reservoir back of the capital, capable of storing about 500,000 gallons. The naval reservation is thus afforded an excellent water supply and

LEPER RECLUSION COLONY, TUMON, GUAM

adequate fire protection, while thruout the town of Agaña fire-hydrants and, at short intervals, taps for the use of the populace, are provided.

In addition to the water supply system, an electric light plant is now under construction at Agaña, and altho primarily intended for the buildings and grounds of the naval reservation, it is probable that the benefit will be extended later on to the principal streets and possibly to private houses outside that reservation. It has been the policy of the Government to require a moderate payment, in the shape of an annual tax on each house, for the use of the water, and the same policy will probably be followed if the electric plant be enlarged.

Shortly after the establishment of American authority in Guam, the subject of public instruction was taken up by the then Governor. Under the Spanish régime there had been parochial schools and, in the earliest days, 1668, the College of San Juan de Letran had been founded by Queen Maria Ana of Austria and endowed with three thousand pesos per annum out of her privy purse. The college had run down, however, and the fund had disappeared in a manner not understood even to this day. It was desirable, moreover, to establish schools in which English should be taught, but all appeals for direct Congressional aid for this most important object have been unavailing. A school system has, nevertheless, been established, and the report of the Superintendent of Public Instruction shows, for the year ending June 30, 1910, an attendance of 1,790 pupils, of whom 977 were boys and 813 girls. Of these 1,098 attended the public schools of Agaña.

The instruction is in English, exclusively, and the progress, considering the conditions, is satisfactory, for it must be borne in mind that the great majority of the pupils are children of parents in very poor circumstances, tillers of the soil, with but the merest rudiments of an education themselves, who would greatly prefer having their children help on the "ranches," as the little holdings are called, to spending the day in school. They speak no language themselves save the native Chamorro, and the children, on return to their homes at the close of the day's instruction and until again assembled in school, hear and speak only Chamorro.

Again, the teachers are drawn from Americans who happen to be in the island, with but little choice as to their qualifications as teachers, and from en-

listed men from the marine guard and the hospital corps attached to the dressing stations in the remote villages, who are usually glad to add to their pay the small sum allowed from the island treasury for this additional service. Several of the teachers are former enlisted men who have married native wives and elected to remain in Guam, and others are young natives who have completed the course in the public schools. Too much, therefore, cannot be expected from an educational standpoint, and allowance must be made for frequent slips in grammar, shocking to the educated ear, but, after all, very common in our own communities. The object to be accomplished is to have the child of the present generation learn to express itself intelligibly in English and to know how much change is due from a $2 bill after a purchase at the traders.

The wives of several of the civil employees, clerks who are sent out from the States for a term of two years' service at the naval station, have, at times, by permission of the Navy Department, been appointed "special laborers" with the understanding that they be assigned to duty as teachers; being ladies of education they have rendered excellent service in the more advanced grade, or "high school," whence all the native teachers are now drawn, thus solving the problem of a supply of teachers for the primary grades. Unfortunately, however, these as well as the personnel of the enlisted force, are constantly changing, not infrequently in the middle of a term, greatly increasing the difficulties of the question of education in the island.

An extensive hospital plant has recently been completed, consisting of three separate buildings, or wards, to one of which, by special authority of the Navy Department, women and children may be admitted for treatment—a concession unique in the history of naval hospitals. Up to December, 1909, these had been cared for in a building converted from a private dwelling into a hospital and owned by an association composed of voluntary contributors and named after the founder, the wife of a former American Governor, whose devotion to the interests of the people of Guam was endless. This "Susana Hospital" for Women and Children was so damaged by an earthquake on December 10, 1909, as to render it beyond repair and even dangerous.

A cablegram to the Navy Department reporting these facts and requesting an allotment to build a new hospital to re-

GOING TO THE FANDANGO

place the former structure met with immediate response, and a large, commodious building has been erected, reserved for women and children, who freely avail themselves of its advantages. A duplicate of this building, reserved for the treatment of gangosa and other special patients, has also been completed, these

While Guam, from its location in the vast Pacific, in the region of the northeast trades and the southwest monsoons, enjoys a climate unexcelled by any in the tropics, its inhabitants are, nevertheless, subject to several diseases with which the medical officers have been waging unceasing warfare. Tuberculosis here

UNITED STATES NAVAL HOSPITAL AT AGANA, GUAM
One of the two new hospitals built by the author of this article; open to women and children of the Island

buildings being connected with each other and with the general, men's, hospital by runways for the expeditious transportation of patients between the several wards and the operating room.

In order that the name of the founder might be preserved, and with the aid of the endowment fund contributed by Mrs. Russell Sage for the original hospital, a new Susana Hospital is under construction, having advantages and conveniences far beyond those of the old, in which the more serious cases, requiring quiet and privacy, may be treated, and to which all women and children can be transferred should an emergency call for the use of the ward now devoted to them.

claims for death more victims than any other single disease, due to the unhygienic modes of life of the natives and an apparently deep-rooted dislike to calling in the doctor until the disease has progressed to a dangerous state: every effort is being made to educate them to an appreciation of the necessity of promptly reporting their maladies to the medical officers, and with gratifying results. The use of water from the unsanitary wells, already referred to, and the disregard in the past, of the most ordinary rules of sanitation, have caused an almost universal infection from intestinal parasites including the hookworm, with which practically all the children are infected.

This is being fought systematically, and one school at a time is being marched to the hospital for a fortnight's observation and treatment, the percentage of the infected being practically 100.

Shortly after the American occupation it was learned that a number of lepers who had been recluded by the Spanish authorities had, during the interim between the departure of the Spanish Governor and his officials and the arrival of the first American Governor, returned to their homes in various parts of the island, and were still at large. A tract of land called Tumon, about three miles from Agaña, was at once purchased, out of the island funds, and a reclusion colony established as a protection, primarily, of the American forces of occupation; and, altho the island treasury has never been reimbursed for its outlay, Congress has provided liberally ever since 1907 for the maintenance of these unfortunates and for the further improvement of the colony.

To the disease, peculiar to Guam, known as "gangosa," whose outward effects are even more terrible than those of leprosy, the medical officers have from the very first devoted their earnest attention. Attacking the mucous membrane of the throat and nose, gangosa spreads rapidly if neglected and destroys the nose, lips and eyes, rendering the features repulsive and, in extreme cases, utterly destroying them; other parts of the body are also affected. Its outward resemblance to leprosy made it advisable to recluse its victims in a colony adjacent to the leper settlement but divided therefrom, and to place them under the same rules as regards isolation with those of the former; the same laws as to inspection and reporting cases of leprosy apply also to gangosa, the unanimous recommendation of the medical officers of the station being necessary to commit the patient to the colony.

Some two years ago a careful and painstaking study, on new lines, of this disease was begun by the medical officers of the hospital, the genealogy of every patient who had come before the authorities being traced and the origin of the existing condition of the "gangosa" thus determined to the satisfaction of the investigators. A new method of treatment was tried, giving results so satisfactory that it became practicable to release from the reclusion colony nearly all the remaining cases, the contagious nature of the disease being disproven. The "Hospital for Special Patients" already referred to was built, to which the patients report daily to have the lesions treated with results that exceeded all expectations.

In addition to these improvements, made under the cognizance of the Navy Department, the Department of Agriculture has recently established an Agricultural Experiment Station at Guam, purchasing for the purpose fifty acres of land near Piti and placing in charge an agent who has had some experience in the Philippines. Roads have been laid out, administrative buildings erected and a portion of the land placed under cultivation. The necessity for an Agricultural Experiment Station in Guam, whose climatic conditions do not differ widely from those of the Philippines, does not seem very clear, but the $15,000 annually appropriated forms a welcome addition to the income of the island, where a greater part is expended.

The main product of the island is now and ever will be, copra, the dried meat of the coconut, and it is very doubtful whether the natives who raise this on their small ranches—or, rather, accept the bountiful crops of nature in return for the least possible labor—will ever change their methods as the result of instruction from the experiment station. The yearly yield of copra—about 600 tons—is promptly bought up by the Japanese traders, and exported to Japan in their own schooners; and, even tho it increased many fold, it would still go the same way, as no other cargo carriers ever put in at Guam.

A concession of great importance to the people of Guam is the authority, recently granted by Congress, to carry a limited amount of commercial freight in the United States Army transports, which are the only vessels, save the Japanese schooners, already referred to, that touch at Guam, bringing the mail and supplies for the naval station from San Francisco, once in each month. This, and the removal in October, 1909, of import duties on articles of American man-

ufacture or origin, enables the traders to import their stock from the United States instead of from Japan as heretofore.

The object of taking over Guam from Spain was, primarily, to secure a landing place for the trans-Pacific cable, then in contemplation. The cables have since been laid and the Commercial Pacific Cable Company, upon land leased from the Government, has established an extensive plant, offices, operating rooms the employees' quarters, on the eastern end of Orote Peninsula, near the village of Sumay, fronting on the Bay of San Luis de Apra. The shore ends of four cables land here, the cable from San Francisco, via Honolulu and Midway Island; the Japanese cable from Tokyo, via the Bonin Islands; the German cable from Java, via Yap; in the Carolines, and the cable from China, via the Philippines. Every message to or from the Orient is relayed at this station.

Commercially, Guam is not likely to be of value in the near future, if, indeed, ever. While the area available for the cultivation of coconuts would yield 200,000 tons of copra, the actual export of copra for the twelve months ending June 30, 1910, was but 534 tons. The lack of transportation facilities is often put forward as a reason for this small output, but the chief factor is the unbusinesslike methods which obtain in all parts of the island among the natives. No doubt American capital would be welcomed in Guam, but capital would do well to look at all sides of the problem before investing. Meanwhile the islander lives his life in peace and contentment, and is, apparently, far happier than the average dweller in many a more advanced country.

AGANA, GUAM.

# The Hiding of the Graal

BY THOMAS WALSH

NIGHT and the winter blast; and out afar
  Upon the wastes, a paladin grown gray
In rusted armor, seared with toil and scar,
  Fared with a lagging bridle on his way.

His deep eye fixed in space; his only guide
  The worn steed's search for herbage o'er the plain;
With pallid lips and fallen breast he sighed,
  "The Graal! The Holy Graal!—I seek in vain!"

My dreams of youth,—this fearless arm that smote
  The foeman of the Cross,—my body worn
With fast and pilgrimage by shrines remote,—
  My manhood withered on a quest forlorn!"

Then from the darkness one arose beside
  His stirrup, stretching forth with empty palms;—
"Alas, poor Leper, without purse I ride,—
  I seek The Graal, as thou art seeking alms."

"Nay, brother, mine and thine is selfsame quest;
  But grant me water,—for at last I fail!"—
He loosed his gourd; against the Leper's breast
  Sudden he saw it gleam—The Holy Graal.

BROOKLYN, N. Y.

# Co-operation

BY N. O. NELSON

[The author is well known as the head of the great profit sharing N. A. Nelson Manufacturing Company of St. Louis, Mo. He has described in our columns his model village at Leclaire and the results of his many other undertakings.—EDITOR.]

JUST before George Jacob Holyoake died, in 1906, in his ninetieth year, he said that of all the reforms, political, religious, and social, that he had been connected with in over seventy years of an agitator's life, co-operation was by far the most important. I am of the same opinion myself. Co-operation is not a noisy or conspicuous affair; it asks no laws in its favor, it makes no appeal for aid or endowment. Self-reliance and mutuality are its principles. Most of my readers will best be introduced to the extent to which co-operation has grown by the information that in Denmark about four-fifths of the population belong to co-operative associations; in Great Britain there are about two and a half millions stockholders in co-operative stores; eleven countries have wholesale stores, the English one selling 125 million dollars a year and manufacturing thirty-five millions.

Any number of people join in forming an association for any business they choose. It may be a store, factory, creamery, shipping, banking, packing. They subscribe a limited number of shares, each pays what he can and agrees to pay the remainder in instalments or by applying the profits on his trade or labor. Each shareholder has an equal vote without regard to the money he has paid in. They incorporate, adopt rules, elect officers and start business. They buy and sell for cash, pay the legal rate of interest on the amount of capital paid in or borrowed and divide the profits in proportion to the purchases made or the work done. Anybody and everybody may join a store or shipping association; in a factory only so many can be admitted as there is room or work for; in a creamery or cannery, as many as the size of equipment will accommodate.

Many sorts of attempts have been made to get around the merchant or middleman. It is a common belief that he is a parasite who sucks the blood of the working people, a robber who holds up the helpless public, a speculator who buys cheap and sells dear, a swindler who irrigates his sugar and weights his scales. To circumvent him and take revenge, hot-headed reformers have started labor exchanges, cost stores, class stores and ill-digested and ill-managed co-operative schemes. They have all come to grief, thousands upon thousands of them in this country alone.

The legitimate merchant performs the function of bringing goods from where they are made to where they are wanted, buying in large quantity and parceling out in quantities to suit the purchaser, whether wholesale or retail, making up and delivering assortments of a class or several classes of goods. With few exceptions he sells at competitive market prices. When his work is done and his expenses and living are paid, he may have a profit or a loss. If he is a competent merchant, has sound judgment of what his patrons want, treats them fairly and faithfully, and if the times and locality are favorable, he makes a profit. The majority of merchants make a loss, either retiring or failing. This elimination is a steady stream, amounting to a considerable percentage every year.

The profits of the prosperous merchant would be much larger without raising prices or lowering wages if, to what he now makes, were added the advertising and other non-productive expenses, and if there were fewer stores and he enjoyed a larger and steadier trade. Co-operation allows of saving to the members, these several items in addition to the profit that is now made by the prosperous merchant, and the economy of a consolidated trade.

All the patrons being partners in the business, they need not be cajoled by

daring advertisements; they need not have the most costly premises or superficial attractions. There is provided just the necessary room and help to do the distributing work.

Every city and town is full of stores, but the stores are not full of customers. They are mostly empty and the clerks mostly idle. So I have found it by making a practice of looking in at store doors on prominent city thorofares as well as in country towns. In wholesaling there are other classes of useless expenses. The expense rate of wholesale stores, taking all classes of goods together, will average fully ten per cent. The expense rate of the English and Scottish wholesales, including interest on capital, is two and one tenth per cent.

Here, then, are legitimate economies amounting to a comfortable percentage. But it is at best nothing glaring or entrancing, nothing approaching the common assertions of reformers and the expectations aroused. It is so very easy to lose all the economies by incompetent management and insufficient trade and turn profit into loss. This has been the all but universal experience in the United States. It was the experience in the early history of co-operation in England. Nearly all countries have had their experimental periods of failure.

The co-operative store, being started, pays fair wages, but no exorbitant salaries; it pays simple interest on the capital, it sets aside some of the profits for surplus, and some for education, spreading knowledge of co-operation among its members, its neighbors, and the public. All the remainder it returns to the patrons in proportion to purchases. The non-member patrons receive half the rate of members. The entire community may thus be participants and yet there is a difference in behalf of those who assume the responsibilities of ownership and management. This broad-gauge, generous plan of half-dividend to non-members and a hearty welcome to everybody is the chief reason for the rapid spread of co-operation in localities or countries where rightly started.

The co-operators are exacting accountants. An account of stock is taken every three or six months, the profits are ascertained and dividends on purchases are apportioned. The amount of each member's purchases is usually shown by tickets issued with the purchases, a copy of which is retained and footed in the books. The member brings in his bunch of tickets as if they were currency and the amount is either credited on his unpaid shares or paid to him in cash or left on deposit to draw interest. Non-members' purchases are shown in a different color and are figured at half rate, payable in cash.

Interest on the share capital and borrowed capital and deposits is always charged into the expense account. A reasonable per cent. is written off for depreciation of buildings, fixtures, teams and the like. A certain per cent. is transferred to surplus account and something for co-operative education and promotion. The remainder is "profit" and is divided on purchases.

Credit in retail trade is one of the world's great evils. On the part of the consumer, it leads to extravagance and thriftlessness and a helpless dependence on continuous income. When, for any reason, the income suspends or ceases, the victim is a pauper. On the part of the dealer it makes much account-keeping and collecting and losses. He attempts to make up for all this by adding it to the price, and this the consumer pays, if he pays at all.

Cash payment is one of the cardinal principles of co-operation. When the member pays as he goes, he, or most commonly she, will be more chary of unnecessary purchases. It is much easier to hold on to the hard cash than to say "no" to a persuasive solicitor or clerk. The habit of thrift grows when there is always cash in the house, and when there is also a quarterly cash dividend on the purchases and on the shares.

The highly paid mechanic as commonly lives up to his whole income and trades on credit as does the common laborer. The salaried employee is as commonly behind with his grocer and butcher as the low-wage clerk. The co-operative cash system overcomes the debt habit and starts a deposit account at the store or a deposit book with the savings bank. The rule is not always lived up to, but

it should be. When once caught up, it is easier to stay on a cash footing than it is to pay the month's account.

The buying is also for cash. In wholesaling there is always a cash discount, varying from one to six per cent. on different classes of goods and length of the credit time. On assorted merchandise it will average three per cent., all of which is saved by the cash plan. In addition to this, it is customary to give lower prices to cash buyers, because there is no risk and there is sharp competition for so desirable trade. Cash buying has the effect of preventing overstocks and the accumulation of dead stock. Having just so much capital for goods, the manager is on the alert to see that it is all invested in salable wares. Selling for cash enables the store to buy for cash with no more capital than if it should buy on credit and sell on an equal credit. Credit creates no capital; it only transfers the temporary use of it from one to another. When this is done in the form of lending money for business or productive purposes, it is legitimate and useful. It puts into active use any capital which the owner does not himself wish to manage; it collects together the many small sums in the shape of bank deposits and lets them out as loans for productive purposes to firms or corporations who have the ability and responsibility to assure its repayment.

But in the buying and selling of goods credit is an endless chain—the wholesaler or retailer who sells on credit must buy on credit. Did he sell for cash he could pay cash. The only beneficiary is the consumer, and to him it is a delusion and snare.

It is provided in the rules that a member may transfer his share if he means to remove or wishes to withdraw. When a store has become possessed of ample capital, it is the custom to take up the share of a withdrawing member at the amount he has paid in.

There is a minimum of share capital which a member must subscribe and a maximum which he cannot exceed. Usually this is placed at $25 minimum and $250 maximum. As a member has an equal voice regardless of his shares, the interest which he receives is the only inducement to exceed the minimum. When he has money to spare or does not wish to draw his dividend he leaves it with the association at interest. There must never be a high interest rate or any portion of the profits awarded to capital, for this is capitalistic, the very reverse of co-operation. To whatever extent it is done, it reduces the dividend on purchases and it tempts the rich to buy up the shares and the poor or improvident to sell.

Co-operative shares are certificates of membership, the necessary capital being contributed by the members according to their means and equalized by the payment of interest (or dividend). Co-operation creates its own capital by storing up the ordinary profit and the extraordinary economy. It escapes frenzied finance and speculation by owning its capital and paying only its ordinary interest value; it builds up its trade and membership by giving them the profit which they have contributed. Capital is needed; it is created by profit, interest and rent. In private business, capital is used by and for the many, but owned by the able or the lucky. In co-operation it is owned by all and used for all.

Minnesota alone has about 1,000 co-operative creameries, several hundred grain elevators and fifty or more stores affiliated in a league. Farmers' productive co-operative business is taking the lead in this country as in Denmark, France and Ireland, while in Great Britain stores, Germany credit banks and Belgium bakeries have come first. Once successfully introduced in one department of trade it spreads to others.

# Literature

## The Medici*

The history of the Medici family, of Florence is almost the history of the Italian Renaissance, with its wide reaching commerce, its glorious art, its revival of learning, and its superb political intrigue. For a hundred and fifty years, the Medici, as bankers, art patrons, diplomats, popes, and princes, were the leaders around whom turned the politics and culture of Italy. The history of this family is perennially interesting. It is strange, therefore, that hitherto no complete account of their fortunes has appeared either in Italian or English. Col. Young has undertaken to supply this defect in two stout volumes, handsomely printed, and adorned with a hundred full-page plates, picturing the notable members of the family, their palaces and tombs, and the famous art-works created for, and collected by them. The author has written for general readers, rather than for scholars, and lays no claim to original research. His aim has been simply to depict the family as a whole, its rise, its "course upon the mountain-tops of power," and its decline and end. He has, on the whole, succeeded in this object, and although the book is in no way remarkable for charm of literary style or profundity of treatment, it is interesting, and happily free from that sentimentality which mars so many of the semi-popular works concerning the great.

The first volume treats of the history of the family from Giovanni di Bicci, the founder of the house, down to the abolition of the Florentine Republic by Pope Clement VII, the nephew of Lorenzo the Magnificent, in 1532. This was the time of the greatest glory of the Medici, their patronage of Art and Letters, their wise rule of Florence, and their steadying influence in Italian politics. The author emphasizes the fact that much of the noblest art of the Renaissance was directly due to the instigation and inspiration of the Medici family, and incorporates into his book many pages about the life and labors of the architects, sculptors and painters who worked in the pay of the mighty Medici. And thru all this story of triumph in art runs a thread of intrigue with city-state, and Pope, and French King—with miniature wars, exile and conspiracy, and sudden deaths enough for any tragedian. The author devotes much space to freeing the Medici from the criminal charges that history has laid at their doors. It must be said that he makes out an excellent case for them, and seems to have clear evidence that in comparison with the other rulers of the time, they were singularly humane and generous toward their enemies, and governed their city by sheer force of personal appeal and political ability. The student of politics will find the book inadequate at just this point. The author practically ignores the interesting subject of the political relations between the Medici and the people of Florence. One would like to read something of the secret motives that guided them in that gradual ascendancy to power, always unofficial, which they obtained over the government of the city; of the exact connection between their wealth and political power; of the workings of that great banking house itself, which was the material foundation for the ramifications of their versatile genius. But this focussing of political interest on the relation of wealth and "boss-ship," and of "boss-ship" and government, is rather modern, and Col. Young in following the beaten track has ignored that aspect of his subject.

Nearly half of the second volume is devoted to the story of Catherine de' Medici, and of Catherine Sforza, the mother of Giovanni delle Bande Nere, the only soldier of the Medici. The history of these two women is exceedingly romantic even for that most romantic time. The former, the last lonely representative of her branch of the Medici, was left an orphan and without relatives soon after birth; she was a source of

*THE MEDICI. By *Col. G. F. Young.* 2 vols. New York: E. P. Dutton. $8.50 net.

LIVES OF THE EARLY MEDICI AS TOLD IN THEIR CORRESPONDENCE. By *Janet Ross.* Boston: Richard G. Badger. $4.

contention to the Florentines during her girlhood, and finally, after a career as the unpopular consort of a French King, she became Regent and ruler of France in the last years of her life. The latter, a woman of beauty and character, but stern and terrible in vengeance, wore out the last few years of her life as a prisoner of Cæsar Borgia. The history of the Medici and their city after the younger branch of the family comes into power in 1537 is one slow degeneration. The Medici get their royal title of Grand Dukes of Tuscany, but the glory and genius of the house seems to have departed. Two hundred years later the line dies out and Tuscany becomes an appanage of Austria.

As an interesting commentary on Col. Young's book may be read the letters of the early Medici, translated and compiled by Janet Ross. Here are two hundred or more of the letters of Cosimo, Piero, and Lorenzo the Magnificent, their children, dependents, and political allies. They treat of household matters literary subjects, Papal and inter-city politics, business, war, and pageants, and give a charming, if fragmentary, picture of the many-sided life of men of affairs of the time. The political and personal letters of Lorenzo are masterpieces of adroitness, but those of the other writers convey a less decided impression of individuality, with the exception perhaps of the letters of Agnolo Poliziano, known to us as Politian, the poet, friend of Lorenzo and tutor to his children. They are delightful; the wit, charm and flavor of the Renaissance spirit are there in perfection.

## Racial Problems*

We commend the collection of essays presented to the Races Congress, held at London in July, to the careful attention of a multitude of people, statesmen, publicists, social reformers, on the one hand, and of that large class in our own country who have taken it as a cardinal and undisputed fact that the Caucasian race is the natural king of races, and that Anglo-Saxondom is the crown upon its head. To be sure they will not read it, for they either are unwilling to be converted, or they are too ignorant to know their ignorance and seek knowledge.

The volume contains sixty papers by as many scholars, relating to the nature of race, the differences between races, racial progress, racial ethics, racial prejudice, subject races, half-breeds, and the special negro problems in the United States and Africa. When we say that Dr. Wu Ting-Fang tells of progress in China, Israel Zangwill of the Jewish Race, the late Sir Charles Dilke of Indentured and Forced Labor, Professor Caldecott of the Influence of Missions, Sir Harry H. Johnston of the World Position of the Negro, Prof. W. E. B. Du Bois of the Negro in the United States, Baron d'Estournelles de Constant of the Respect Which the White Race Owes to Other Races, Prof. Felix von Luschan of the Anthropological View of Race, Prof. Charles I. Myers of Racial Mental Differences, and Prof. Franz Boas of the Instability of Human Types, we have only indicated the breadth of the discussions and the authority of those who have taken part in them.

Those not familiar with the later anthropological studies will be surprised at the unanimity with which old prejudices are swept away. Thus Professor Myers tells us that the mental characters of the peasants of Europe are essentially the same as those of their primitive ancestors of the Stone Age, and that any differences are due to environment and education, and that it appears that all present primitive people can equally be changed by environment. Mr. John Gray shows that the natural capacity of the Chinese is such as to promise them a very high place in intellectual standing; Professor Boas shows how rapidly physical race changes take place under new environment; Professor Lyde says that skin-color is of purely climatic origin, like sunburn, and that the blackest people live in unforested tropical lands; Prof. Finch Earle shows that miscegenation does not reduce intellect or fertility; Professor von Luschan, of Berlin, finds one human family, of three races, white, yellow and black, which intermarry with no loss of fertility, but all from one

*Papers on Inter-Racial Problems, communicated to the First Universal Races Congress held at the University of London, July 26-29, 1911. Edited by G. Spiller. 8vo, pp. 475. Published for the World Peace Foundation, Boston. Ginn & Co.

stock and the differences due to environment, and no one type necessarily inferior to another; Sir Charles Bonci, late Governor of Mauritius, speaks for equality of opportunity for all, without distinction of race or color; Mr. J. Tengo Jabavu, of South Africa, tells us that Christian missions are thus far the sole philanthropic agencies to elevate the Bantu people, and Prof. de Lacerta, of the University of Chile, says that mulattoes show no intellectual inferiority, and that in Brazil color prejudice is dying out, that mulattoes have reached the highest political offices, and that in a century the negro will disappear and the resultant race will lose the negro characteristics.

The general effect of these papers is to increase our respect for humanity of whatever race, and to impress the importance, especially in this country, of antagonizing the arrogance of white contempt for those of a darker skin.

**State Socialism in New Zealand.** By Le Rossignol and Stewart. New York: Crowell & Co. $1.50.

New Zealand is the sociological experiment station for the world. Being an isolated country with a small and homogeneous population, intelligent, well educated and public spirited, and with a fertile soil and healthy climate, New Zealand has successfully tried out a number of radical measures. This book gives the history and results of these experiments, to date, in an unprejudiced, thoro, scientific fashion. It shows a discernment, penetration and impartiality which command the reader's confidence. It is clear that New Zealand's daring measures have produced neither the millennium hoped for by their enthusiastic promoters nor the bankruptcy predicted by their biased opponents. In consequence of serious strikes in 1907-8 the Compulsory Arbitration Act, which had been expected to produce a land without a strike, was greatly modified in the hope that all classes might be reconciled to it. But many trade unionists are still in revolt against it and its ultimate victory is not assured. The policy of breaking up large estates and, with the aid of Government loans at low rates, settling workers upon them, at rentals to be readjusted at long intervals, has created a class of small farmers who now embarrass their creators by demanding full freehold ownership, while the town dwellers seek the nationalization of the land. The long catalog of labor laws, while they have improved the condition of wage earners, have not procured contentment. The numerous Government industries—coal mining, fire insurance, life insurance, railways, telegraphs, telephones, banking, cold storage—tho they provide good and cheap service and are usually conducted with efficiency, yet are not so markedly prosperous as to create a popular demand for the immediate extension of state activities. Wages are considerably lower and the cost of living somewhat lower than in Colorado, a State very analogous in economic character to New Zealand. Wealth is distributed more evenly than in Australia, tho the cities show differences of fortune, millionaires and paupers, to about the same extent as cities of similar size in America. But the average wealth is higher than in any other country, tho not so high as in our own richest States. Altogether the record is encouraging, but not intoxicating. It demonstrates anew that economic progress is slow, that no single nostrum will cure all social ills, that each country must adjust remedies to its own peculiar conditions, and that what is one country's food may be another country's poison.

**Souls in Action.** In the Crucible of the New Life; Expanding the Narrative of "Twice-Born Men." By Harold Begbie. New York: George H. Doran Company. $1.25.

**The Shadow.** By Harold Begbie. New York: Fleming H. Revell Company. $1.25.

Mr. Harold Begbie writes with the eagerness and descriptive power of a high-class journalist. He draws his materials from his own intimate knowledge of London's conditions and the many life stories he has gathered from the reclamation centers in the city's degenerate quarters. His narratives are concerned with the soul history of those who, having gone down step by step into the social underworld, are recovered to a more normal life by the power of religious ef-

fort. A deep human interest is inherent in these sketches, but it is not necessary always to give them the interpretations upon which Mr. Begbie insists. It is especially unfortunate that the author should inveigh against theology on the ground that it makes religion difficult, and then attempt at every turn to bolster up by these examples a rather narrow and purely dogmatic view. What seems to Mr. Begbie simplicity itself will strike many as inadmissible assumption. The best results of the book will be a larger sympathy and hope for the defeated and fallen, and a rising determination to abolish social conditions that conspire to brutalize and degrade the weak and unprotected. In *The Shadow* Mr. Begbie shows the effects of sin upon character; an old theme but yet novel in modern fiction, where for the most part a deviation from the strait and narrow path is treated as a mere incident, more or less embarrassing if found out but adding to the interest or amusement of life. Mr. Begbie has seen too much of sin to take the customary frivolous view of it, and in this story of a mother and her son exposed to the temptations of both wealth and poverty he teaches reliance upon religion for support and deliverance. No novel has appeared in many years so filled with the spirit of devotion and self-sacrifice for conscience's sake.

**The Conservation of Water.** By John L. Matthews. Boston: Small, Maynard & Co. $2.

Conservation of natural resources has become a catchword. Like good health everybody wants it, tho not everybody is willing to take steps to get it. Few realize its benefits so acutely that sacrifices for its sake come easy to them. This book displays, in simple but attractive manner, free from technical terms or overscientific elaboration, the truly wonderful program for the conservation of water and the allied savings. By harnessing our water power a mechanical force can be developed exceeding the whole force now generated by burning coal. By constructing reservoirs and replanting forests at the head waters the floods which devastate our river valleys will be abated and a deep channel for navigation secured. Already in Wisconsin the value and efficiency of every water power on some rivers has been doubled by such means, and mill owners on other rivers have called upon the State forester to treat their streams in like fashion. Irrigation is making the desert to blossom like a garden and is creating, out of wind-blown sand, a fertile area as big as Ohio, Indiana and Illinois. Scientific drainage is proceeding more slowly to the conversion of miasmatic swamps equal in size to three more States into farms as rich as the Nile Valley. And the whole vast plan is so profitable that the author concludes with a realistic picture of the reclaimed Mississippi and the thriving, healthy, easy-living farmers on its borders, which, with its glimpses, of electrical wonders, universal prosperity and picnic existence, suggests an American Utopia.

**The Spirit of Democracy.** By Lyman Abbott. Houghton Mifflin Co. $1.25.

Dr. Abbott's style smacks more of the bar than the pulpit. His appeal is mostly to the head; rarely to the heart. His sentences have snap and precision. His thought is definite and logical; too cold to stir emotion, too exact to allow evasion. Of course, his premises are not always accurate, his logic not always without gaps, or else all his conclusions would be irrefutable. But withal his heresies (and he dares often to be heretical) are so well argued as to compel the candid reader to examine traditional beliefs anew. For instance, he approves the restriction of the suffrage in the Southern States to persons who can read and write, who own property worth $300 and who have paid their taxes. Frankly he expresses the wish that Northern States could adopt the same rule. And by a historical survey of the ballot and an analysis of its purpose he strives to defend that position. In similar fashion—by his examination of the fundamental purposes of life—he opposes the extension to women of that suffrage which he says is neither a right nor a privilege, but a duty. He arraigns socialism, not in ignorance nor prejudice as the sum of human villainies, but with understanding of its purpose and program to distribute wealth equitably by the extension of public ownership and operation over all the

staple means of production. His objection is to the method as ineffective, not to the aim as wicked and chimerical. His own preference is for "that phase of socialism" which he christens Industrial Democracy, under which the laborer owns capital and the capitalist labors. Argument for such a system runs smoothly into the fallacy that the sewer should be owned by the sewerman and the school by the teacher. That danger the writer does not wholly escape. He does not try to show how the workers in the oil industry are to buy out Mr. Rockefeller or the steel workers Mr. Carnegie, nor what assurance the "ultimate consumer" would have that the price of kerosene or steel rails would be reasonable if the laborers owned a monopoly. Perhaps his radical utterance that no individual has "any more right in the soil and its contents than in the ocean and its contents" suggests a way to prevent the monopolization either of oil or steel.

**Timothy Flint: Pioneer, Missionary, Author, Editor, 1780-1840.** By John Ervin Kirkpatrick. Cleveland: The Arthur H. Clark Co. $3.50.

Those who know nothing of Timothy Flint may learn something of the man by reading the title page of this biography, which is complete if we add this final flourish:

"The story of his life among the Pioneers and Frontiersmen in the Ohio and Mississippi Valley and in New England and the South."

We have his biographer's word for it (if we have need of that) that this missionary was a man of God; he was also, one may safely add, a somewhat "difficult" man, in spite of his scholarship and Christian principles. "I also have had enemies, and bitter ones," he wrote, with Scriptural accuracy. Yet his ministry was not without its compensations, nor was the least of these its literary opportunities. Flint was, to be sure, addicted to "fine writing":

"We admit ourselves, that we have a pernicious attachment to ornamented speech,"

is the sentence with which he clinched this point for us. His writings are none the less considerable and even important in American literary history. Mrs. Trollope, who saw much of him in Cincinnati, highly regarded him both as an individual and as an author. Certainly he had fluency, and attempted exercises in more forms than most clergymen undertake. He was one of the few Americans of his age to manifest enthusiastic appreciation of French literature, and to play a part in popularizing the study of the German literature and language. Dr. Kirkpatrick tells his story sympathetically, in spite of the stiffness of his style. The appendix and bibliography, like the notes, are evidences of conscientious labor. The index is not exhaustive, but is useful so far as it goes. This book is attractive not only from the standpoint of the student of literature or of missionary effort, but also from that of all those who read with interest narratives of Western travel in the early days. Its physical properties are, let us add, admirable; paper, printing, wide margins: all these contribute to the reader's pleasure.

**John La Farge: A Memoir and a Study.** By Royal Cortissoz. Boston: Houghton Mifflin Co. $4.

"As time went on he developed an intense interest in the book, coming to regard it as a kind of repository for the recollections and reflections which, in other circumstances, he might have embodied in a book of his own. We had been close friends for twenty years, and there was a perfect trust between us. He gave me freely what he had already put into manuscript, and continued to write."

This passage from the first chapter of Mr. Cortissoz's memoir of "our sole old master" goes far to state what is the value of the book. One may add that the critic of the New York *Tribune* proves himself a discreet and devoted friend. It is especially appropriate that such a one should write the memoir, for La Farge's friendships were expressive of his personality no less than were his writings and his mural decorations and stained glass. He was, to his friends, "a lambent flame of inspiration." "I have heard some brilliant talkers," continues Mr. Cortissoz, "Whistler among them, but I have never heard one even remotely comparable to La Farge." He did not set up as an epigram-maker, the, "sometimes I do clever things," he confest. His best conversation

"held you on a far higher plane. There he practised a serene eloquence, ranging over

fields so spacious that in addition to the weighty substance of his talk he stimulated the listener as with a sense of large issues, of brave venturings into seas of thought. He had seen the world, he had known a multitude of men and things, and this rich experience reacted upon his nature. But his complexity was a central possession, it was of the very texture of his soul. There went with it, too, a peculiar poise, a strange, self-centered calm. His pronounced sympathy for the East was easily understood. He liked its attitude of contemplation. His own habit was meditative. But where his individuality made a still further claim was in the direction of a tremendous intellectual and spiritual activity."

As an appraisal of John La Farge's art, this tribute is a welcome but not impeccable work. Indeed, it has modest pretensions here. As a character study, it seems to us beyond criticism. The book is beautifully printed, and no less beautifully illustrated.

## Literary Notes

....The latest addition to the American Book Company's useful "Gateway Series" is *Selections from Abraham Lincoln,* edited by Dr. A. S. Draper (35 cents).

....*Queed,* like "The Broad Highway," among this season's most successful novels, was declined by several New York publishers before a Boston house appreciated its value.

....There are fine tales in *"Tell it Again" Stories,* by Elizabeth Thompson Dillingham and Adelle Powers Emerson (Ginn; 50 cents); and they will be welcomed by kindergarteners, mothers and youngsters.

....The high standard set for the Home University Library by the initial volumes is maintained by the recent additions *The Opening up of Africa,* by Sir H. H. Johnston; *Crime and Insanity,* by Dr. C. A. Mercier; *Liberalism,* by L. J. Hobhouse (Holt; 75 cents each).

...The Putnams are about to issue an English translation of the *Recollections of a Parisian,* by Dr. Poumiès de la Siboutie, a witness of three revolutions, and a subject, in turn, of Louis XVI, Napoleon I, Louis XVIII, Charles X, Louis Philippe and Napoleon III to say nothing of the Republic.

....Operagoers and others will welcome Oliver Huckel's retelling of Wagner's *Gotterdammerung* in English blank verse (Crowell; 75 cents). The libretto of the opera cannot be read with any pleasure; Mr. Huckel's work, on the other hand, is done lovingly and understandingly—in and for the library.

....The edition of Dickens's *Christmas Carol,* published by Crowell this season, is illustrated in color by Ethel Everett, and both in its pictures and general makeup is a most attractive presentation of the masterpiece of sentiment (Crowell; $1.50).

....The price of Gilbert O. Ward's *Practical Use of Books and Libraries: An Elementary Manual* is one dollar; that of the accompanying *Teaching Outline,* 50 cents (Boston Book Co.). The manual is intended for the use of high school students and library apprentices, and appears to be practical and of value.

....Sir George Douglas, whose essays on "Scottish Poetry" we commented on in our issue of August 31, has made an interesting collection in his *Book of Scottish Poetry* (Baker & Taylor; pp. 928; $2.50). The range is from twelfth century Thomas of Erceldonne to R. L. S., James John Davidson and Maria Stewart.

....Two unpublished five-act dramas by Dumas *père* have been discovered, with a quantity of letters to Dumas, among the papers of one of his secretaries and collaborators, Noël Parfait. "Le Fils du Forçat" is drawn from the playwright's novel, "Monsieur Coumbes"; "Pietro Tasca" is the title of the second piece, whose scene is Venice.

....*Facts for Freshmen,* published by the University of Illinois, Urbana, differs decidedly from most university hand books in being attractively printed, neatly bound and readable. Its author, Dean T. A. Clark, professes to give information about the University of Illinois alone, but his advice as to studies, habits and fraternities is based upon so much knowledge of college life and boy nature as to be useful anywhere.

....The Jewish Publication Society of America, Philadelphia, sends forth its *American Jewish Yearbook* 5672 (1911-1912), (50 cents), just as the Jewish New Year is approaching, September 23, 1911. In addition to the usual statistical data, "The Passport Question" between our Government and Russia is extensively treated. The report of the fourth annual meeting of the American Jewish Committee—an organization aiming to look after Jewish welfare everywhere—embraces the immigration and naturalization questions and also the recent activities of Russia, the fiendish foe of the persecuted people.

....In a lecture recently delivered before the Université des Annales, at Paris, the novelist Daniel Lesueur made some interesting generalizations on the subject of "The Popular Novel." From the French point of view, the masters of that form are Hugo, Sue, Dumas and Erckmann-Chatrian. The

popular novel is preeminently a serial, to begin with, and its first condition is, says this critic, "the rigorous morality of the work, in form as well as in essentials, and the author engages to make over any situation or passage which risks shocking the reader of the working class for whom it is destined."

....We quote verses contributed by Mr. Ellis Parker Butler to the September *Bookman*:

I want to know how Bernard Shaw
Does his hair—if he's bald, or not at all.
I want to know what kind of socks
M. Maeterlinck and Howells use.

I have great curiosity
Regarding George Ade's new Easter tree.
Has Gouverneur Wells of late employed
Hairpins of any or colorless?

What kind of soap does London like?
Does Robert Chambers ever "hike"?
Or did he ever? Or, if not,
Does he like cabbage, cheese, or what?

I want to know the size of gloves
Oppenheim wears, and if he loves
Olives, and how his clothes are made.
What does he eat? How is he paid?

All sorts of things I want to learn
That are not of the least concern
To anyone. For, O'! and Oh!
I want to know! I WANT TO KNOW!

I want to know, and know I will—
The printing press is never still.
For me it prints such facts as these!
I am the Public, if you please!

Now we know who it is that is accountable for the slush published in our so-called literary magazines!

....What is called *The 1911 Bible* is the old "authorized version of 1611 carefully amended by American scholars," and published by the American Branch of the Oxford University Press. It has excellences to be recognized by those who do not choose to use the Revised Version. It is printed on very thin and yet opaque paper in a fairly large type, and it manages to secure by extra spacing the advantages of the paragraphy system while yet keeping the verse divisions. It makes special claim to corrections in the text where needed, so that it is the Old Version revised, but not so as to disturb the reader. The changes are few, but we notice that such a palpable error as that in 1 John 5: 7, 8 the three witnesses, is corrected to follow nearly the Revised Version; but 1 Tim, 3: 16 "God was manifest in the flesh" is not corrected, nor does Acts 20: 28, "the Church of God which he hath purchased with his own blood" follow the correction of the American Revision. It is a beautiful volume, in limp morocco, with maps, of light weight, suitable for study and reference uses. No particular editor is mentioned, unless it be the Rev. C. S. Schofield, D. D.; but a list is given of over thirty conservative clergymen who are said to be responsible for the text corrections.

## Pebbles

If you have reason to suspect the cleanliness or healthfulness of your milk supply, pasteurize yourself in your home immediately before using.—*Illinois State Food Commission Bulletin.*

It was Sambo that was bemoaning the fact that he had forgotten to fasten the door of his chicken-house the night before.

"Were they stolen?" he was asked.

"No, they went home."

Elie Metchnikoff, the great French bacteriologist, eagerly buys a live gorilla for three thousand dollars. He could buy a member of the Illinois Legislature for half the money.—*Life.*

Perspiring Customer—Ph-h-h! Bring me something cool.

Waitress—Yes, sir. Would you like an ice?

Perspiring Customer—No, no; something cooler than that.—*Punch.*

Upgardson—Your cousin is a practising physician, isn't he?

Atom—He has discovered one or two specifics for cancer, I believe, but he hasn't settled down to regular practice yet.—*Chicago Tribune.*

From the death notices of the New York *Evening Post*, January 21, 1804:

In England, John Tucker, a soldier in Ashford Barracks. He died at 4 o'clock in the morning; before 12 in the same day his widow was married to another man, and in the evening the happy couple followed the corpse of the first husband to the grave as chief mourners.

DO YOU TWIG?

There was a young lady named Ginter,
Who married a man in winter;
The man's name was Wood,
And now, as they should,
The Woods have a cute little splinter.

O. Henry once promised to write a story for one of the big magazines, but it failed to arrive after many requests. Finally the editor went to O. Henry's apartment and sent up a curt note: "If I don't have that story within twenty-four hours I will come up and kick you down stairs. I always keep my promises." O. Henry promptly sent back the note: "Dear Bill: If I did all my work with my feet I'd keep my promises too."

An Aberdonian went to spend a few days in London with his son. After their first greetings at King's Cross Station, the young fellow remarked: "Feyther, you are not lookin' weel. Is there anything the matter?"

The old man replied, "Aye, lad, I have had an accident."

"What was that, feyther?"

"Mon," he said, "on this journey frae bonnie Scotland I lost my luggage."

"Dear, dear, that's too bad; 'oo did it happen?"

"Aweel," replied the Aberdonian, "the cork cam oot."—*San Francisco Argonaut.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Development of the House of Governors

Up to this time the annual conference of the Governors of our States has been devoted to conferring simply. The Governors have done no voting, but have simply talked to each other much as is done in a Quaker meeting, coming when they could to "the sense of the meeting," and looking to concurrent legislation. But this year they have done more than President Roosevelt had in his mind when he sought their aid on conservation, and have taken definite action, appointing three of their number to appear before the United States Supreme Court to argue an appeal against certain decisions of inferior courts. As Governors of States they are naturally States' rights men, after a fashion, and feel it their duty to see that the rights of their States under the Constitution are not invaded by the central national Government.

The decisions of the lower Federal courts objected to are those that enjoin State railroad commissions from regulating intrastate rates, on this ground, among others, that they would interfere with interstate commerce. Particularly a decision by Justice Sanborn, of the United States Circuit Court of Appeals, against the Railroad Commission of Minnesota, was severely attacked by Governor Hadley, of Missouri, Governor Aldrich, of Nebraska, and Governor O'Neal, of Alabama. Governor Aldrich, particularly, used very strong language, quite outdoing the criticism for which President Roosevelt was blamed, as destroying the respect due to courts. He even said that the "trouble comes from the fact that in many instances these inferior courts are composed of lawyers who owe their position not so much to legal attainments and profound learning as to political service rendered." We agree with both President Roosevelt and Governor Aldrich that courts are not absolved from criticism. Every citizen of competent intelligence has the right to disagree with their decisions and to criticise the judges who render them.

It would seem on the face of it that the Governors are right in their contention. Let the national Government control interstate commence, as it has done in annuling State laws forbidding the importation of alcoholic liquors; but laws made by a State regulating transportation rates within its own boundaries would seem to be within the State's own rights, with no Federal interference; and so the Governors unanimously agreed, declaring that the removal of that right would make the States but provinces within the national Government. Accordingly they took the novel and evolutionary, if not revolutionary, action of appointing Governor Harmon, of Ohio, Governor Hadley, of Missouri, and Governor O'Neal, of Alabama, to argue the rights of the States before the Supreme Court.

And yet, in the familiar words of Sir Roger de Coverley, "there is much to be said on both sides of the question." Let us take, as an example, the action of the State of Texas, which has reduced its railroad rates for the carriage of cement, for the very purpose of giving the preference to dealers in Texas cement and discriminating against cement which might otherwise be brought in from other States. Here is a case in which the purpose of the Interstate Commission to equalize conditions of trade and traffic is blocked by action of intrastate rating. Is that constitutional or right? In Art. I, 9, 5, the Constitution says:

"No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another."

This provision does not verbally forbid the Texas rating, for it mentions only "ports." To be sure Denver is a "port" under the rulings, but it has a custom-house; and we do not know that there is an inland "port" in Texas. But railroads were not known when the Constitution was written, and this discrimination is of just the sort which the Constitution meant to forbid. To bring the Texas case under this constitutional provision would be no great stretch of interpretation. An attorney might even argue that an intrastate rate intended to favor citizens of one State and shut out others contradicts the purpose exprest elsewhere: "The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States." IV, 2, 1.

It was precisely because of the fear that the conference of Governors might become a House of Governors, a sort of consolidated legislative executive, that not a few found fault with President Roosevelt for calling the first conference. We had no such fear and have none now. Evolution is a good thing. The friction of contrary views will keep the evolution within safe limits. We see no reason why in their representative capacity Governors Harmon, Hadley and O'Neal should not present arguments that will have weight with the Justices of the Supreme Court, and we have no fear that the Governors will bulldoze the Justices. We do not care to attempt now to argue the case or to anticipate the decision. We know that the interests of the whole country are more important than those of the several States, and yet it is a principle of prime importance to hold fast to that provision of the Constitution which declares that "the powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people."

## The State: Why

THERE is nothing new in the syndicalist proposition to get rid of the political state and turn over industrial capital and its management to a unionized proletariat. The dream of a world without political authority, and emancipated from law, is as old as the institution of government, against which it protests. The revolutionary labor movement merely gives it an up-to-date expression.

And even the modern expression in anarchistic creeds is not strictly new. The intellectual father of both "individualistic" and "communistic anarchism" was Rousseau, who voiced the desires of the one in his talk about the "return to nature," and formulated the philosophy of the other in his distinction between "aggregation" and "association," and in his proposition that in association the individual will must be merged in a general will, which, for practical purposes, is the will of the majority.

States, as Rousseau regarded them, are merely "aggregations," created and held together by force. "Association," or society, is always spontaneous and voluntary. Its basis is essentially, tho not necessarily in form, a free contract, because those who belong to it enter it freely and remain in it because they want to. Association comes into existence because of oppression. The State, created by force and governing by force, itself oppresses, and, by creating privileges, creates and defends oppressors. The oppressed create society in the true sense of the word when they voluntarily enter into combination to resist the oppressor and win freedom. In the struggle that follows it is right for associated men to use any measures, however violent, against neutrals as well as against the enemy (for trade unions, for example, to make war upon "scabs"), because, if any one refuses to join the association to fight oppression he elects to live under oppression, and therefore must not complain if he is oppressed.

Now, Rousseau's analysis happens to be good sociology as far as it goes. But nothing is easier than for a fool to do mischief with a good knife, a good gun, or a good philosophy. It is true that there are two types of social combinations, both historical, both existing today: the coercive type, of which the State is the supreme example, and the free or voluntary type, of which the Christian Church once aspired to be the supreme example, and of which the "Industrial Workers of the World" aspire to be the supreme example now.

What Rousseau failed to tell us, how-

ever, and what free associationists in all ages, including the present, have failed to see, is the group of obstinate facts which explain the existence and the persistence of coercive society, or the State, in the face of all the dreamers and the revolutionists of all generations. Those facts are three, namely: (1) The struggle for existence often brings together in search of economic opportunity, a multitude of persons whose interests conflict, whose ideas and feelings are different and who therefore cannot spontaneously co-operate; (2) A common peril, nevertheless, compels them to make common cause; (3) Under these circumstances they submit to the suggestion, the will, the tyrannical rule of the strong man, be he a military leader, a gang bully, or a district political boss.

But, say the syndicalists, war and militarism are kept alive by capitalistic greed. Capitalism and war will disappear together. What common danger will be left to necessitate general organization for anything but industrial purposes? For industry, let men combine and submit to the general will. In all other relations and activities of life, let them be free, without government or law.

Undoubtedly labor leaders of the revolutionary sort believe this social diagnosis. And the fact that they do believe it makes some of the rest of us despair of their intellectual processes.

The syndicalist believes it because, as a convinced and enthusiastic "communist-anarchist" he is unable to size up the "individualist-anarchist," or to grasp the fact that a good big one-half of the human race consists of persons who won't agree with anybody or work with anybody if they can help it. He will not admit that one-quarter of mankind is made up of dead-beats, who won't work, even to support themselves, if they can steal or beg. He denies that one-eighth of mankind is made up of persons who are prepared to prey upon their fellowmen, not merely by wheedling and sneak-thieving, but by violence and cruelty.

The syndicalist believes that the unsocialized half of the human race is a product of oppression. "After the revolution" he expects all the fakers, swindlers, gamblers, thugs and cut-throats to come purring up to the economic hearth of syndicalism and ask to be set to work!

Well, we predict that they won't, and that the syndicalist will save his philosophic face by the short and easy device of calling them "scabs," and that when he discovers that they won't work when opportunity is offered, he will proceed with a high hand to make them work. In other words, having kicked the State out at the front door, he will proceed to bring it in again at the back door with all possible haste, and for the same moss-grown reasons that have justified it thruout the ages!

## British Educational Problems

The British Association for the Advancement of Science at its recent Portsmouth meeting devoted much attention to the needs and methods of education, a subject that has of late years been occupying a larger space upon the programs of this body, as well as of the sister society in the United States. Both the British and the American Associations have now a Section of Educational Science, and while it may be questionable whether education is yet entitled to such recognition as a science on a formal equality with astronomy and chemistry, still, there is no question but that it is an important subject to consider and an interesting one to discuss.

Sir William Ramsay, before he passed on to his hobby, radium, in his presidential address, took time to deliver a few sharp blows at two established British institutions, the examination and scholarship systems. He ascribed lethargy of thought in England largely to the "external examinations," and commended instead the Continental and American custom of "trusting the teachers to form an honest estimate of the capacity and ability of each student and awarding honors accordingly." He denounced bribery by scholarships as "a form of pauperism practically unknown in every country but our own" and advised that the beneficiaries of such funds be required to repay them if and when circumstances permit. The amount of money expended annually in university fellowships, scholarships and business represents in Great Britain a capital

value of over $37,000,000, and if most of this expenditure could be recovered it would go far toward putting university education on a satisfactory basis.

The president of the educational section, Bishop Welldon, took up the same theme, and declared it "an evil scarcely capable of exaggeration," that the pecuniary benefits intended for the poor should have become the perquisites of the rich. "In the field of secondary education the competition for scholarships and exhibitions have become so severe that scarcely any boy in the examination for them stands a chance of success, except at a cost of three or four years spent beforehand in an expensive preparatory school."

Bishop Welldon was for fifteen years headmaster of the two great public schools of Dulwich and Harrow, so he speaks with knowledge and with feeling of the oppression of secondary education by the ancient universities of Oxford and Cambridge. The smattering of Greek which they insist upon requiring of all students for entrance is "both a farce and a nuisance." But the abolition of compulsory Greek is not enough. The atmosphere of the ancient universities should be changed. To a modern university, like Manchester, men and women come as students; they come to learn and they do learn. The atmosphere of Oxford and Cambridge is more social than intellectual, and the number of undergraduates who can in any sense be called serious students is but a small fraction of the whole. It seemed to him that the ancient universities in conferring degrees without an adequate guarantee of knowledge were largely responsible for the indifference of English society as a whole to the value and dignity of learning.

At present, the bishop said, the universities of Oxford and Cambridge are the close preserves of the Church of England, but he hoped that eventually all the universities, ancient as well as modern, would be free from theological restrictions. Coeducation, he recognized, is already an established reality in both the ancient and the modern universities, tho in the former degrees are denied to women. Coeducation is also becoming more common in the day schools, but he did not see how it could be introduced into the boarding schools "where the life was ordered on somewhat artificial principles." On the evils of segregated education he quoted Adam Smith:

> "That the education of boys at distant great schools, of young men at distant colleges, as well as ladies in distant nunneries and boarding schools, seems in the higher ranks of life to have hurt most essentially the domestic morals, and consequently the domestic happiness both of France and of England."

Many of these British problems are also our own, tho in a lesser degree. Examinations are not all powerful in this country, and they are not usually set by an external and independent authority, except in such cases as State regents examinations, admission to legal and medical societies, and entrance to universities. But our universities have not the power and prestige of the English, so they are now conforming with more or less reluctance to the demand of the secondary schools for the right to regulate their own affairs. The recent modifications of their entrance requirements made by Harvard and Chicago are striking illustrations of this tendency.

None of our universities have so abundant scholarship funds as Oxford and Cambridge, but we are not so free from the perplexities of such pecuniary assistance as Professor Ramsay thinks. We are beginning to hear not a little complaint of "bribery" thru scholarships by rival institutions, and "the endowment of mediocrity." Evidently we must be on the watch if we would escape the evils of England; the clutch of the dead hand, the formation of cliques, the fossilization of courses, the dominance of formal tests and the curse of uniformity. To prevent these evils we can hardly do better than to follow the four principles which Bishop Welldon lays down as the essentials of all true progress or reform in education.

> "1. That every child shall enjoy the opportunity of developing in full measure the intellectual and moral faculties with which God has endowed him or her.
>
> 2. That no difference of opportunity, or as little difference as possible, shall exist between the richer and the poorer classes of society.
>
> 3. That the supreme object of education is to provide good citizens—citizens who, in

Milton's stately language, will be able to 'perform justly, skilfully, and magnanimously all the offices, both public and private, of Peace and War.'

4. That, as the personal influence of the teacher is a potent factor in education, it is the business of the State to ensure the highest possible efficiency, not only of intelligence but of character, in the men and women who adopt the educational profession as their life-work."

## Mushrooms

DURING the last few weeks a series of deaths in and around New York, at least a score in all, have been reported as occurring after the eating of toadstools mistaken for mushrooms. A certain number of deaths from the same cause are reported from various parts of the country each year, especially during the spring and fall. Only rarely, however, do so many of them occur at the same time and in the same locality as on this occasion. There is no doubt that at times when attention has been called by the newspapers to deaths of this kind, other forms of severe digestive trouble are sometimes referred to the eating of fungi tho really other causes are at work. There are digestive symptoms resembling those caused by toadstools that occur after the eating of milk products in certain forms of decomposition, particularly spoiled or fermented cheese and ice cream that has been refrozen after an open ice-cream freezer has allowed its contents to melt. Besides, there are severe, sometimes fatal, symptoms of various forms of ptomaine poisoning in connection with shell-fish and certain kinds of sausage and other sophisticated meat foods that are readily put under this heading when excitement runs high. It is probable that these sources of poisoning have somewhat swelled the number of supposed deaths from the eating of toadstools even on the present occasion. Publicity always tends to disturb proper consideration of all such subjects.

Poisonous fungi are, however, undoubtedly responsible for a number of deaths each year. This is true in spite of the fact that it is not difficult for one who knows to distinguish between healthy and toxic fungi. Some of the correspondents in the newspapers have asked why those people who are taking risks in gathering mushrooms, or what they think are mushrooms, for themselves do not consult books and pictures and descriptions that would enable them to judge between the healthy and the poisonous. Of course it is easy to understand that most of those who suffer from this sort of poisoning are the least likely to consult authoritative auxiliaries of this kind in our libraries, museums and botanical gardens. Besides, there is always an element of danger in this, for while the ordinary mushroom is very easily distinguished from the ordinary toadstool, there are many forms of these fungi which occupy a middle place, some of which are non-poisonous, tho closely related and similar to plants which are highly dangerous. The amateur expert who gets his knowledge from books and diagrams and pictures is especially likely to think he knows it all in this matter and thus lay himself open to serious consequences, and unfortunately, as a rule, not only for himself but relatives and friends and, above all, children.

Mushrooms are not such a valuable food that any special risk ought to be taken in their eating. We called attention in our editorial on Diets, Simple and Mixed, in THE INDEPENDENT for September 7, to the fact that while for a time, owing to their nitrogenous content, there was an impression very prevalent, even among physicians and scientific dietitians, that mushrooms would make a valuable food product to replace meat to a considerable extent in warm weather and especially in tropical countries, further careful investigation has shown that the nitrogen content of mushrooms is available for human beings only to a slight degree. While their flavor appeals to some people, it will be found that it is usually a particular mode of serving mushrooms that makes them a favorite article of diet. Cream and meat sauces and butter are used in such a way as to make them tasty. The largest amount of the nutrition of the dishes thus made from mushrooms comes from these added materials. They are valuable almost entirely as tasty additions to diet, which leave a considerable residue, and therefore stimulate peristalsis and prevent or ameliorate that sluggishness of the bowels which is such a common symptom of our modern rather undiversified diet.

It would not be worth while, then,

even for the poor, whose diets are least varied, to take any special risks in the matter of adding mushrooms as a variety to diet. Even tho gathered by those who consume them, they are not a cheap food because of the additions that usually must be made to them as prepared for the table. When they are used it is almost indispensable to have them selected by an expert, that is, by one who knows non-poisonous from poisonous varieties by study of the plants themselves, and who has had some definite training in this matter. The man who is his own lawyer is a fool, it is said, as also the man who is his own physician. The man who is his own expert on mushrooms, however, unless he has had the training for it, would have to have some special term in the superlative degree invented in order to properly characterize him.

There is no need, in spite of recent casualties, for those who like mushrooms to feel alarmed over the continued eating of their favorite dainty, provided they have good reason to know that proper care has been exercised in the gathering of them, or that some definite agency of experience has had charge of it. Death from toadstools we have always had and always will have, tho fungi will continue to be a proper and salutary element in the diet of a good many people in the future as in the past.

## Prohibition in Maine

After a week we do not yet know whether or not the citizens of Maine have decided to retain the constitutional amendment which absolutely prohibits the sale in the State of alcoholic beverages, so close is the vote.

We would have every saloon in the State closed. They are a curse and nothing but a curse. It is a blessing to any community when it banishes this more than mischievous institution. Drunkenness is cultivated, fostered and provided for by the saloon; and drunkenness causes more poverty, suffering, cruelty and crimes, ruins more homes and hastens more deaths, than any other form of vicious indulgence. Beside alcohol opium is comparatively negligible because occasional, tobacco is even innocent and tea and coffee innocuous stimulants. Till men, and some women, learn self-control prohibition is a desirable rule.

The question is, as to the extent of prohibited territory. The more the better, of course; but the principle is the same whether we have constitutional prohibition in a State, or local option in a town or county. What we want is prohibition that will prohibit, prohibition supported by a voting public spirit which will punish infractions. In the State of Maine public sentiment has not prohibited, but has defied the constitution and the law in the cities. The law has been notoriously ineffective, and the city officials have been parties condoning the violation of law.

Now by a vote of the people—that is of the men—for we believe the women would have voted differently—it is made clear that they have no prevailing desire for prohibition. The vote is evenly balanced. It appears clear that any policy on which the people are so uncertain, half one way and half the other, should not be fixt by the constitution, but left to the laws. A constitution should represent a settled general conviction, such as it did when the present constitutional provision of Maine was approved by an overwhelming majority. Now there is no visible majority for it, and it is impossible to enforce it for that reason. A new population has come into the cities, and they have and should have their rights. With regret we discover this fact, and we believe that under the circumstances it should be left to the legislature to control the selling of liquor in the State, and that this should be by a local option law, so that a town or county can exclude the saloon with the certainty that infractions will be punished. Local option is of the same principle as State-wide prohibition, only it prohibits in a smaller territory. In towns or cities which prefer to have saloons the tax—called falsely a license—should be made very high, so as to limit the number of saloons and shut out the low doggeries. This will be partial prohibition, which is better than none.

What the saloon does appears in the case in Coatesville, Pa. A man went to a saloon and got liquor enough to make him drunk. Thereupon an offi-

cer of the law tried to arrest him and was shot dead by the drunken man. Then the vicious element of the town, its hoodlums and hooligans, the very men who had frequented the saloons, caught the drunken murderer and burnt him alive, and put an indelible stain on the reputation of the State of Pennsylvania. The responsibility rests on the saloon, and on the respectable men who signed the petition vouching for the character of its keeper and asking that he be allowed to make his living in this way.

One must ask why it is that from a vote of 40,000 majority Maine has sunk to an even vote on prohibition. With some who live in the cities we presume the reason is that they are disgusted with the failure to enforce the law, and they do not want a law that is not enforced; but these are comparatively few. Most who believe in prohibition want the law retained, and have not lost hope. The main cause for the change is the change of population. In the larger towns and the cities, manufacturers have brought in a class of people not yet assimilated, and so not amenable to the religious and moral ideals of the older population. The foreign immigration has been very great, particularly of French Canadians, and we fear they have not yet been brought under that influence for abstinence which is being exerted over the second and third generation of the Irish immigrants. The Churches ought to be able, if united and earnest, to control all moral conditions and establish a nearly uniform and permanent public sentiment; but that is not yet secured.

## The Wise Tourists

ANY one who is willing to get out of bed early enough in the morning will, during the month of September and that of October, be able to see flocks of birds migrating to their Southern homes. They travel by night, and they drop down on our lawns and into our orchards for breakfast, sometimes staying two or three days, provided the food is abundant. For long stretches they have to go on short rations, and they make up for this when they come on some of our orchards where there are plenty of wild cherries and mountain-ash berries still hanging on the trees. They then rise up in the air soon after sunset, and start again on their travels. If one will take the trouble to watch these birds of passage and hear their excited talk as they find a rich feast, he may be impelled to plant a few bird trees, for no other purpose but to give them a surer supply of food when they come his way.

None of these birds go by the Pullman, and none of them either check trunks or carry gripsacks. It is a modest economy from first to last, not only the lunching by the way, but the method of going. It does not seem quite impossible that we shall yet invent some sort of an aeroplane with which we can make our passage nearly as economical as that of the robins and bluebirds. Fifty years from now who shall say that flights of human beings will not be as regular southward in October as is that now of the feathered fowl? In the present state of aviation we are certainly privileged to imagine something much simpler in the way of mechanism, and not unlikely something more like wing flight.

When these neighbors of ours reach the South, they seek those sections which are best provided with food, rarely flocking two years in succession to the same locality. Here in the North, however, they have their specific homes, to which they return with singular regularity. Domestic attachments and home instincts go with song, and so we find that these friends of ours, while decidedly talkative in Florida, sing very little. Once in a while in their camp-meetings they will toss off a hymn, or possibly say a prayer. The gush of melody that goes with baby training and domestic life has no affinity for this residence in a foreign land. Foreign it is in every sense of the word. They have come simply to get away from the foodless months, and their hearts are still with the maples and apples.

Robin flocks often number thousands, and they can be seen by moonlight. They make very little noise and are easily overlooked; but in their starting they are rather excitable and not a little noisy. The bobolink has already gone into the rice fields of the Carolinas, and has

changed his garments with his habits. He is a peculiar bird, and makes a whole thing of any job he undertakes, and for this reason he has a new dress and a new song and leads a real home life wherever he is. Our robins and bluebirds and grosbeaks have the same habits when flitting northward, that is, they travel by night and conceal themselves as well as they can, but they are shamefully slaughtered on the way.

Before starting they form camps, where they spend a good many days in organizing and talking over matters, and they are evidently officered. These gatherings are in bayheads or by the lakes, where they can secure a plenty of water and a plenty of food. Bluebirds are often so exceedingly numerous as to color the atmosphere, and the robins number tens of thousands. They seem to be very anxious to be off, but evidently wait for couriers to advise as to the conditions of things ahead. All this while, they are living communistically, without any domestic relations that are discoverable. The mates of last year do not recognize each other as such, and we think they rarely remate for the coming season.

During their passage thousands are killed, especially of those that cross the Western States. It is for this reason that the Western robins seldom get as domesticated with human folk as those of the Eastern States. They are compelled to cross Kentucky and Tennessee, where they are sold at a dollar a hundred for pies. It is a shame that our laws are not yet able to get hold of the case and make the life of the robin as safe as the life of the man. It is for our interest as well as theirs, but in this case it is a shame to be compelled to appeal to the economics of the case. A bird that works as companion and friend, destroying millions of our insect pests, certainly ought to be protected from the slaughter of idle ignorance.

There are slow changes constantly being wrought in bird habits, wherever their environments are specially favorable or specially unfavorable. We can easily make our homesteads very delightful to our feathered companions, and they will soon find out that they are both safe and welcome. Birds that generally do not leave the environments of the forest can easily be made to nest in our orchards and by our doors. The hermit thrush, and the wood thrush, and the grosbeaks, and the indigo bird are only a few of those who can be persuaded to be our companions, and add to our choir.

More of these birds will stay all winter with us in Ohio and New York if we plant more with the purpose of furnishing them food. Few of them dread the cold, but their migration is caused to prevent starvation. In the South more of the herons are nesting without migrating North. The quail, under the suggestive protection of our recent laws, is beginning to domesticate himself. He is as good a bird or fowl as any that we have in our yards. He is the only one that will eat potato-bugs. Our petted robin probably does as much damage as any bird that we encourage, but it is almost entirely in the way of reducing our cherry and currant and berry crop.

The oriole and the bluejay have got to answer for themselves, for they jab their bills into an unnecessary number of grape bunches and peaches, and seem to be wholly lacking in any sense of economy. As for the damage done by the robins and catbirds and most of the thrushes, all we have to do is to plant enough to give them their daily food; that is, plant for our whole family. There ought to be some thousands of mountain-ash trees set along the fences and the edges of the farms from the Atlantic to the Pacific.

## The Fifteenth Amendment

THERE are men in our Southern States who think it worth while to urge the repeal, or, if not that, the annulment, of the Fifteenth Amendment, which gives to the freedmen the right to vote. If they fear it is impossible to get the amendment repealed in one of the ways provided by the Constitution—that is, by another amendment adopted by three-fourths of the States, or by a constitutional convention — they imagine it can be annulled by the Supreme Court, which may be persuaded to declare it unconstitutional; that is, that it was not constitutionally adopted by three-fourths of the State. They will try to prove to the satisfaction of a

majority of the Justices of the Court that a number of the States were coerced into accepting it, and that their act was therefore not valid. We would not begrudge their entertainment to those who take pleasure in such anticipations. They might employ their energies in a more mischievous way.

We have in mind the State of Mississippi, where three candidates lately sought the nomination for Governor, and where this proposition to seek the annulment of the Fifteenth Amendment was a burning issue. To be sure, there is no more chance of annulling or repealing it than there is of repealing the commandment to love one's neighbor as one's self; in fact, the attempt to repeal the one is an attempt to repeal the other. But they do not all see it so in Mississippi, and one of the most earnest in the effort is an old friend of THE INDEPENDENT when he was a New York pastor twenty years ago, the Rev. William Hayne Leavell, D. D., LL. D., who was trained under the influence of his father-in-law, the late distinguished Senator George, of Mississippi. As he calls our attention to a pamphlet written by him, urging the annulment of the Fifteenth Amendment, we take the occasion to consider the argument for it, which he and not a few others are taking somewhat too seriously.

The argument offered by Dr. Leavell and those he represents is that the negro is an inferior race, not capable of voting intelligently, and therefore ought not to be allowed to vote, and the amendment giving him that right should be annulled. The whites are superior, and must be predominant, and are determined to rule, by fair means or foul. At present the means used are confessedly foul, and therefore Dr. Leavell would have the amendment annulled; and then the States could by fair means disfranchise all negroes; and when negroes know that they cannot vote they will cease to seek equality and will be contented and quiet in their inferior position. This is actually the argument, and this the anticipation which a usually sensible man presents to us for our approval.

Ours is "the superior race," he says. But before God, and properly before men, we are not to be approved or condemned as races, but as men. The eighteenth chapter of Ezekiel argues that principle at length, even under Judaism, and it is the basis of the Christian religion and ought to be of any Christian civilization or government. Individuals are good or bad, superior or inferior, not races. There are negroes not inferior to Dr. Leavell, possibly his superior. There are all sorts in all races.

But being inferior, the negro must be kept in subordination and must not mix. And yet he does not seem to be so inferior, for Dr. Leavell allows that he is getting education and wealth, and he fears—miscegenation, a process which has, however, gone on a good way with no great opposition on the part of the white men of the South. But Dr. Leavell says:

> "Before such a terrible cataclysm could sweep all barriers away, our race, which has never submitted to any other, never permitted any other long to block its way, which has never balked at any means necessary to clear its path, and which has always won, would rise in ungoverned wrath and utterly annihilate every condition and every person and thing that made such a disaster possible. Under necessity we would do that without hesitation and without remorse."

That is, rather than allow intermarriage of those who might wish it, the white race would murder the black race without remorse, and Dr. Leavell would feel no remorse. We can tell him that if equal legal rights were given, very few would want intermarriage; but with it forbidden and the race made legally inferior and subordinate, miscegenation would continue as it has in the past.

Put he does not like to anticipate the method of massacre; his alternative is perpetual "subordination," and for that reason he would have the Fifteenth Amendment annulled, so that Mississippi might deprive the negro of the right to vote. He says:

> "Were the negro deprived of his vote and deprived of the expectation that his right to vote will sooner or later be recognized and allowed, it would not take ten years to produce harmonious relations between the whites and blacks as a whole."

An amazing statement! It is more likely that bedlam would follow. Does he think they have not human passions, that they would be satisfied to suffer taxation without representation? If the black in them were so pusilanimous, would not the white in them resent it?

And are not thousands of them as white as the whites, and hundreds of thousands of them half white? Do not they share with the "race which has never submitted to any other," and would they submit in gentle grace?

Dr. Leavell comforts himself with the faith that "practically every thoughtful white man, North and South alike, holds that it was a huge blunder to confer the right of suffrage upon the negro." That is not true. There is not a Northern State in which an effort to deprive the negro of the ballot could find support, amendment or no amendment. We believe that suffrage does not depend on complexion. We believe it is safer to give the ballot to poor men, or stupid men, or men of small or no education, or to black men, or to women, than it is to deprive them of it.

Dr. Leavell concludes:

"While we will and must maintain white supremacy, we should do so in ways and by means that will not tend to undermine our moral quality."

There are such means, by being better men, if they can, wiser men, and with it all, fairer men. But it is impossible to do it by forcible humiliation and subordination of anybody, of whatever color or estate, without moral degradation. To attempt to rob black men or poor men of the right of suffrage, of all equal civil and political rights, is an insolent injustice. To attempt to annul the Fifteenth Amendment so as to keep one's self on top of somebody else is mean and selfish and unjust. It is unworthy of one who preaches the Gospel of Him who came to "break down the middle wall of partition."

By all means let Dr. Leavell read the volume of "Papers on Interracial Problems," presented at the Races Congress in London in July, published for the World Peace Foundation, Boston.

**The Wiley Case**

The congressional investigation of the Wiley case and the presidential decision confirms the view we took in our editorial of July 20, "Tripped by Red Tape," that the fault lay not so much with any individual as with the restrictions of bureaucratic administration which, in the scientific work of the Government, checks initiative and cultivates mediocrity. President Taft says: "The truth is, the limitations upon bureau chiefs and heads of departments to exact per diem compensations for the employment of experts in such cases as this is doubtful legislative policy." We are glad that Dr. Wiley is to retain his office as Chief Chemist, for his services will be valuable to the Government in the future as in the past. But the Board of Referees should also be retained, for the chemical questions continually arising in the administration of the Food and Drug Act are too doubtful and difficult to be decided by any one man, however eminent. The President is, of course, no more obliged to accept the opinion of Dr. Wiley in condemnation of benzoate than he is to accept the opinion of Mr. Wickersham in condemnation of Dr. Wiley. It is the duty of the President to act upon the best chemical knowledge attainable anywhere in the world and it would be presumptuous to assume that this is always to be found in the U. S. Department of Agriculture. Any bureaucratic administration is liable to fall a prey to the disease of neophobia. But a new food product or a novel method of preparation or preservation is entitled to the protection of the common law; it should be assumed to be innocent until proved guilty beyond a reasonable doubt.

**Governor Harmon's Task**

We have intimated in another column that we do not care at present to attack or defend Justice Sanborn's decision last April on the Minnesota rate cases; but we may say that Governor Harmon has no easy task before him. Just now the prominence given him puts him forward as having an equal chance with Governor Woodrow Wilson, or a greater chance to receive the Democratic nomination for the Presidency. But if he should fail of success before the Supreme Court he might get a setback to his ambition. The Supreme Court may very well decline to express any judgment on the right of the States to control intrastate transportation, and may

decide in favor of the railroad companies on the other ground presented by Justice Sanborn, that these particular rates were confiscatory, as they did not allow a profit of more than two or three per cent. to the companies. The Supreme Court does not usually decide on the basis of a major point of complaint when a minor one will do. In the Minnesota case the State put a value on the railroad property very much lower than did Justice Sanborn, and found a handsome profit on the rates fixt by the State's Railroad Commission. The Constitution forbids confiscation of property, and in this case it is a question of fact. Beyond all question the railroads have brought the States into much closer relations, and the control of the national Government has become closer, and this tendency cannot be withstood.

**A Sixtieth Anniversary**

We give our warm congratulations to our valued neighbor, the *New York Times*, on attaining its sixtieth anniversary. When THE INDEPENDENT reached that age three years ago we treated it as a great occasion, and we are glad to see that the *Times* honors its craft in a special historical and illustrated issue. The *Times* has gained a most worthy record from the first as an independent journal. Under its founder, Henry J. Raymond, it supported the Republican party and was a sort of mouthpiece of President Lincoln. After the Civil War it favored President Johnson and an easier treatment of the South. One of its great achievements was the exposure of the Tweed ring, ending in its overthrow. It passed over to the Democratic camp during President Cleveland's campaigns, but joined the Republicans on financial issues when Bryan was a candidate. We greatly admire its motto, "All the News that is Fit to Print," a motto which neither it nor any other great morning daily seems able wholly to follow. It has taken the lead in giving us a high-class one-cent paper, and its patrons are very numerous and loyal. It attracts the same readers at one cent as pay in the afternoon three cents for the *Post*. It has grown younger with its years, as any journal ought that is fit to live.

**Haeckel and Psyche**

Last week, in an address before a Monist conference in Germany, Professor Haeckel repeated his familiar doctrine that man has no immortal soul, and that all those activities which the world has assigned to the mind or the soul are only functional activities of the brain. This is only a few days after Professor Macdonald, at the British Association, had argued that science gives no evidence that the brain may not be an organ played upon by something outside of it; as he would say, by the universal mind. Because the mind and the brain are not always associated, in sleep and under anesthesia, for example, there is at least a possibility that the mind is an outside influence acting on the brain when the latter is in certain states. We this week allow our readers to have a taste of Haeckel in an article on "Psyche." In this article he asserts what is by no means generally accepted by scientists, that all there is of soul is in the brain cells, and that when these cells cease to function the soul ceases to exist. The reader will observe the contemptuous attitude he shows toward those who differ from his sort of Monism, comparing them to sluggish blind worms. Such characterization does not help the courtesies of debate.

**The Elements Not Elementary**

In his presidential address before the British Association, Sir William Ramsay gives an admirably compact account of the evidence coming from the study of radium discovered by Madame Curie, that seems to indicate that not one of the so-called chemical elements, unless it be hydrogen, is simple, but that they are composite. This seemed probable when it was first discovered that they could be arranged in a series, and in an ascending scale governed by their combining weights, from hydrogen, 1, to uranium, 239; and it was made certain as to some of them, when it was found that radium, 227, is formed from uranium by the loss of three atoms of helium, 4; that is, by the reduction of 12 in combining weight. But now radium will lose more atoms of helium and change to other elements, as Sir William Ramsay very beautifully

explains, showing what are the successive "emanations," as they are called, of radium, which are not yet fully studied, as some of them have a very short life, owing to their spontaneous disintegration. We may thus give the chemical story in part as follows: Uranium, 239, loses three atoms of helium, 4, and is changed to radium, 227. Radium then loses another atom of helium and becomes niton, 223. Niton in turn decomposes, losing another atom of helium, and becomes emanation A, 219, not yet investigated, because in three minutes it has half changed into another solid substance by again giving off an atom of helium, and becoming emanation B, 215. This also has not been chemically examined, because in twenty-seven minutes it has changed, not this time by the loss of helium, but of certain electrons that defy weight, giving us emanation $C^1$; but this changes speedily, by the loss of another atom of helium, into emanation $C^2$, 211. This again passes, with the loss of nothing detectable, into emanation D, this into E, and this into F, which Madame Curie calls polonium, still 211. This loses another atom of helium, and changes into a metal, probably lead, 207. Now the problem is up to the chemists; if these elements can be disintegrated, why not all the rest? And when we have learned how, what sort of a world will we have?

**Are They "Lesser Breeds"?**

British pre-eminence in athletic sports is generally admitted. The word *sport* has been adopted, like *beefsteak*, into the European languages. The international golf match won last week by an Englishman supports the claim. But a fine American baseball team that visited Japan last year found no mean antagonists, and now a team of Bengalis have won the banner against the total combination of English football teams in India. The Mahan Bagan team had entered at previous competitions, but had dropt out at an early stage, but this time it appeared immediately that they were a very strong combination. When they reached the semi-finals the public interest became intense, and far bigger crowds filled the grounds at Calcutta than had ever been present before. After success at the semi-finals they had to meet the East Yorks, the crack English team. So great was the enthusiasm that ten thousand people were on the grounds at eleven o'clock, altho the game was not to begin till half past five. When the native team won against the British the crowd, not wearing hats, threw their shoes into the air in their excitement. We are glad the Bengalis won, and such matches, in which both races stand on even terms and the best wins, will do much to promote mutual respect.

"Pretty soft," commented Uncle Joe Cannon when he saw a fellow Congressman make a drive from the teeing ground of the Brae Burn Country Club, at West Newton, Mass. "It's hard to teach an old dog new tricks," was his more humble remark when he had taken 27 strokes (some say 28) before holing out 400 yards from the first tee. He added: "But it's a great game." So several other statesmen have decided. Big game killing is more appropriate to a Roosevelt, but Mr. Taft and Mr. Balfour very properly stick to golf. A recommendable game for statesmen, this: in which patience and coolness of temper are first essentials.

If we may believe Norberto Torcal, "President, Spanish Associated Press," in *America*, the Portuguese Republic has only a very few days longer to continue. He writes:

"The days of the republic are numbered. If unforeseen reverses and mishaps do not intervene, within two months, possibly within a month, the monarchy will have been restored. The country wants it. The army wants it. There are men, there is money, there are arms, there is enthusiasm. What is lacking? A white and blue flag on the border; a shout against the tyranny of the republic."

Since he wrote this some three weeks must have past, and coming events do not yet cast a very black shadow before them.

The food riots are spreading in Europe, as in China, the latest being at Vienna where a number of people were killed last Sunday in a clash with the military. They demanded cheaper food, as have the German rioters whom the

Government hopes to appease by lowering the railroad transportation rates for provisions, when what is really needed is the reduction in the tariff on food-stuffs. The spread of these riots is a very ominous sign, and the monarchical governments may properly look out for revolutionary outbreaks.

Russia is the only European Power that has not now recognized the Portuguese republic. Even with its parliament it is the refuge of autocracy. Even in this country there are many who are anxious to have the republic fail and be replaced by royalty. It is a matter to be noticed that the salary given to the Portuguese President is only $20,000, with about $6,000 for expenses, a very modest allowance as courts go. He can make no gorgeous show of dignity, but that is all the better for a republic.

A number of the British members of Parliament refuse to accept the salary which was voted to them. They think it is not gentlemanly to take it. But it is democratic, for otherwise only rich men can be elected. Now that the courts have decided that labor unions cannot assess their members to pay their elected members of Parliament, it is only decent that they should have a salary as in all other countries.

The murder of Premier Stolypin again illustrates the horrible condition of espionage and sedition that prevails in Russia. Here the assassin is both a spy on both sides, false to both, as is necessary, and at last assigned to this act of murder in a public place where sure of being caught and executed. We should call it a barbarian country if we did not remember that we have barbarism also in our own country.

Two months ago we gave an account of the effort of a young man in St. Louis, at the instigation of his father, to secure the annulment of his marriage from his wife because he had learned, what he had never suspected, that she had a small fraction of negro blood. We are glad to learn that the suit has been dropt and that a reconciliation has taken place.

The time of year has now come when men hunting deer shoot each other in the woods. The fatalities among the hunters will now begin to match those among the air-men and the automobilists. It will be safe to keep as far as possible from the Maine woods and the Adirondacks.

Secretary Wilson, of the Department of Agriculture, defends his action in accepting the honorary vice-presidency of the Brewers' International Congress. He says the business is lawful, and he could not in courtesy refuse the honor. We fail to see why he was compelled to accept it.

The mission of the Protestant Episcopal Church in Mexico publishes a paper at the head of which are the words "Not Protestant." But "Protestant" is on the title-page of the Prayer Book used by the missionaries in Mexico when they come back for a visit. How can they harmonize their statement with the truth?

Under the supreme order, "If they persecute you in one city flee to another," most of the missionaries in Sze-Chuan have escaped to the nearest places of safety, but it is an unverified report that two have been killed. The age of martyrs is not yet past.

When President Taft spoke to the farmers at Erie, Pa., last week, on the value of the Department of Agriculture, the warmest response came from his incidental mention twice of the parcels post. The country wants it.

Governor Noel, of Missouri, was a warm advocate of the direct primary. Now he has been beaten by one and he has changed his mind. He fears it can be more easily controlled by the bosses than the old system.

Colonel Bryan, in his *Commoner*, leads with an editorial declaring that "Harmony Means to Halt." Here "Harmony" means Harmon.

The Persian parliament has decided that women have no right to vote because they have no souls. But we believe that women have souls.

# Financial

## New President of the Bank of Commerce

JAMES S. ALEXANDER, who was recently elected president of the National Bank of Commerce, was born in Tarrytown in 1865 and at eighteen became a clerk in the Tarrytown National Bank. Two years later, in 1885, he entered the Bank of Commerce as a clerk. In 1899 he became assistant cashier, and was promoted from time to time until he became vice-president in 1908. R. G. Hutchins, Jr., who has resigned as vice-president of the Chicago Railways Company to accept the position of vice-president of the Bank of Commerce, was formerly with Harris, Forbes & Co. or the Harris Trust and Savings Bank of Chicago, and was born in Brooklyn forty-two years ago. Henry A. Smith continues as he has done for the past eight years as vice-president of the Bank of Commerce. Mr. Smith was vice-president of the Western National when that bank was merged in 1903 with the Bank of Commerce. The cashier is Nelson Olcott and the finance committee, in addition to President Alexander, consists of J. Pierpont Morgan, Jr.; Henry P. Davison, formerly vice-president of the First National Bank and now with the firm of J. P. Morgan & Co.; F. A. Vanderlip, president, and W. A. Simonson, vice-president of the National City Bank; Frank L. Hine, president of the First National Bank; Charles A. Peabody, president of the Mutual Life Insurance Company, and Albert H. Wiggins, president of the Chase National Bank. Paul M. Warburg, of Kuhn, Loeb & Co., has been elected director in

JAMES S. ALEXANDER
President National Bank of Commerce, New York

R. G. HUTCHINS, JR.
Vice-president National Bank of Commerce

place of Jacob H. Schiff, resigned. The Bank of Commerce has had an honorable career since it was organized in 1839. It is now one of the largest banks in the United States. With a capital of twenty-five million and a surplus and undivided profits of over fifteen and a half million dollars, it has total resources of more than two hundred and seven million dollars.

## Wide Distribution of Pennsylvania Railroad Stock

THE stock of the Pennsylvania Railroad, whose dividend recently paid amounted to $6,764,610, is held by 69,760 persons, the largest number of stockholders in the history of the company. The average holding of each of these persons was 129.29 shares of a par value of $6,464.50. The 10 per cent. allotment recently made by the company increased the capital stock by $38,357,850 up to August 5, 92 per cent. of the holders of the stock having availed themselves of the privilege of paying for the new stock in full instead of in two instalments. The number of shareholders prior to April 12, when the allotment was made, was 66,046, an increase of 3,714 shareholders within the last four months.

The figures show that on August 1, 15.65 per cent. of the capital stock was held abroad by 10,000 shareholders, with average holdings of 141 shares each. In the United States there were 21,545 shareholders in the State of Pennsylvania, with average individual holdings of 108 shares. In New York State there were 12,006 shareholders. The total number of women shareholders was 32,801.

....The foreign trade of Japan in June, and for the first six months of the year, show that while there has been a diminution in exports, there has been a great expansion in imports. Imports in June reached a total value of $31,000,000, as compared with only $19,000,000 in June, 1910, the advance being mainly in wholly and partly manufactured articles. During this same period the exports, on the other hand, amounted to $16,800,000, against $17,500,000 a year ago. For the first six months of the year there is now a total expansion in the imports of $34,500,000 and a decrease in the exports of $3,150,000, the actual excess of imports over exports for the half year being $52,500,000, as compared with only $14,350,000 for the first half of last year.

....The Treasury and the banks will be called upon to finance over $94,000,000 in dividend and interest payments during September. Of that sum $55,000,000 will be in dividends. The great burden of all the financing will fall upon the New York banks and the Sub-Treasury. The Government will have no important payments to make until October, when the interest upon the $600,000,000 consolidation loan of 1900 falls due, and the first interest upon the recent $50,000,000 issue of 5 per cent. Panama bonds will be paid.

....According to a compilation made by the *Journal of Commerce,* new securities issued during the first half of the present year by railroad, industrial, mining and other corporations amounted to $1,229,467,950, which may be compared with $1,048,431,950 for the first half of 1910. These figures show a gain of $181,036,000, for which the railroads are responsible, as the increase credited to them alone is $186,150,000.

....The number of immigrants received in this country last year was $1,071,887, against 957,106 in 1909 and 410,319 in 1908. For the first five months of the present year the number was 354,281, against 515,565 in the corresponding months of 1910. Canada's immigration in May was 61,475 (15,414 from the United States), against 47,589 in May of last year.

....Stockholders of the Bankers' and Mercantile Trust companies have unanimously approved the merger of the two institutions. The Bankers' Trust Company (this is the name of the enlarged corporation) thus becomes the largest trust company in the United States, its deposits amounting to about $110,000,000.

....The Census Bureau's estimate of the value of last year's cotton crop in the United States is $963,180,000, which is a new high record.

# Insurance

## Rated Up Policies

Occasionally a man is induced to apply for life insurance, and after his physical examination receives a policy that is rated up. This means that his physical condition does not warrant the company extending him the same rate that would be given to a normally healthy applicant. A man of thirty, who shows symptoms or a tendency toward becoming a poor risk, might be called on to pay the rate of a normal man of forty. Many applicants on receiving rated up policies become discouraged, and return the papers for cancellation. This action is no more wise than an applicant for fire insurance deciding not to insure because his property is found risky and a higher rate demanded. It is often true that some applicants cannot obtain life insurance at any price, and the mere fact that a company is willing to take an acknowledged poor risk at a slight advance should be an incentive rather than a deterrent to the applicant. The New York Life Insurance Company gives a list of ten payments on rated up policies during a single recent month. One instance is of a Milwaukee grocer insured for $5,000. He was rated up nine years, from 45 to 54, but accepted the company's ruling, and paid the premium. He acted wisely, for he lived less than eight months after the policy took effect. Another instance is that of a New York shoe salesman, who was rated up from 27 to 40. He accepted the policy, and died thirteen months later of heart disease. Many men receive their first warning from a physical examination for life insurance, and a rated up policy should be even more carefully considered for acceptance than a straight policy.

The diplomatic representations of Great Britain, France, Germany, Austria-Hungary and America have postponed until November further action on the establishment of a government monopoly of life insurance in Italy. It is then proposed that companies are to administer existing business to its expiration, but are to have no claim upon the government for indemnity for the interruption. Italians resident in foreign countries will be subject to fine if they insure with foreign concerns, unless they prove by a consular certificate that their residence abroad exceeds one year. All Italian or foreign companies now operating in Italy will be bound to file, within fifteen days after the new act takes effect, their register of policies, which will be checked and closed. The bill is not to apply to mutual institutions or to provident societies which write for amounts not over $100 or a pension not over $20 per year, or to public or private institutions which directly administer insurance funds for the benefit of their own employees. Among the many amendments already suggested is one permitting an English company to continue in Italy another six years, provided they issue policies for not less than $3,000; another amendment would raise the stamp duty on those policies to 5 per cent.

Automobile insurance is still a comparatively new field and figures on losses are interesting. The National Fire Protection Association has tabulated its experience on fires in automobile garages, covering 126 cases on which official reports have been received. Of these 19 were due to causes common to all risks and 71 due to special hazards of the line, with gasoline fires responsible for 17, gasoline or benzine claiming for 14, and filling gasoline supply tanks for 12, while carburetors were responsible for 9 more, the gasoline hazard in general being responsible for over half the known special hazard causes. Sixty-nine per cent. of the fires occurred in the car storage department and 21 in the repair department; 59 per cent. occurred at night and 41 in the daytime; 71 per cent. were while the plant was in operation and 29 while it was not in operation.

There are 1,500 persons killed and 5,000 persons injured annually in the United States as a result of fire.

VOL. LXXI NEW YORK, THURSDAY, SEPTEMBER 28, 1911. No. 3278

## Survey of the World

**Canada Rejects Reciprocity**

The Liberal Government was hopelessly defeated in the Canadian general elections of September 21. The Conservative majority seems to be 49, against a Liberal majority of 43 in the late Parliament. The seats will be distributed as follows, the table showing also their former distribution:

| | 1911 Parliament. | | Late Parliament. | |
|---|---|---|---|---|
| | Liberal. | Conservative. | Liberal. | Conservative. |
| Quebec | 37 | 26 | 53 | 12 |
| Ontario | 73 | 73 | 45 | 51 |
| Prince Edward Island | 2 | 2 | 1 | 1 |
| Nova Scotia | 12 | 7 | 14 | 5 |
| New Brunswick | 4 | 6 | 11 | 2 |
| Manitoba | 7 | 10 | 2 | 8 |
| Saskatchewan | 8 | 2 | 9 | 1 |
| Alberta | 6 | 1 | 4 | 3 |
| British Columbia | 5 | 7 | 2 | 5 |
| Yukon | 0 | 0 | 1 | 0 |
| | 144 | 134 | 136 | 86 |

In this table the one Nationalist member of the new Parliament, elected by a Quebec constituency, is counted as a Conservative. The election in far away Yukon has not yet taken place. Every Province except Alberta shows a Conservative gain. Sir Wilfrid Laurier was returned by two constituencies (Quebec, East, and Soulanges, P. Q.), but eight of his thirteen cabinet ministers lost their seats; and among the losers were William Paterson (customs) and William S. Fielding (finance)—the Canadian negotiators of the reciprocity agreement. The new Prime Minister, succeeding Sir Wilfrid Laurier, who has held that office for fifteen years, will be Robert Laird Borden, a native of Nova Scotia. Says the Toronto *Globe* (Liberal):

"The people of Ontario do not like their neighbors to the south. Liberals by scores of thousands must have joined with Conservatives in city and country to show their objections to having any truck or trade with the Yankees.' The other Provinces, taken together, have a majority for Laurier and larger markets, but, by an overwhelming vote, Ontario has declared that she will have nothing to do with reciprocity. The campaign orators of the Conservative party builded better than they knew when during the last two weeks of the campaign they appealed to the people of this Province to save Canada from the Americans. They created a wave of feeling that was not observable on the surface, but that nevertheless swept the voters from their political moorings."

——Besides the sentimental considerations, the attitude of the railway magnates was potent in deciding the day. Sir William Van Horne, an American by birth, and former president of the Canadian Pacific, has been one of the most outspoken and most violent opponents of the agreement. President Shaughnessy, another American now more Canadian than the Canadians, is known to entertain the opinions of the older officers and ex-officers. Specifically, Canadian railway men feared that grain would go south from Winnipeg, and instead of going to milling points in Eastern Canada would drift toward St. Paul and Minneapolis. The Canadian Pacific Railway is immensely profitable, and it very naturally wants to maintain its present high rates. Experience shows that manufacturers expect it to meet rates on American roads which are being dealt with by the Interstate Commerce Commission in a drastic fashion. The development of the Spokane rate case has been closely watched by business men and railroad experts in the Dominion. Now, permit the West to be closely united thru reciprocity; let the Hill roads get better Canadian connections, and Canadian east and west routes must meet the thru rates established over American lines.

**Mr. Borden's Statement and Sir Wilfrid's**

The leader of the Conservative party in Canada, who was returned in Halifax by about 200 majority, issued this statement upon learning the result of the contest:

"There is no opportunity tonight for more than the briefest statement. In rejecting reciprocity, Canada has simply affirmed her adherence to a policy of national development which she has pursued for many years. The Government, without mandate from the people, undertook to reverse that policy, and, upon submitting their action to the people, were defeated. The verdict was in no wise dictated by any spirit of unfriendliness to the great neighboring republic. No such spirit exists."

The defeated Premier says:

"Victory, which has been so long on our side, has at last abandoned us. It would seem that our adversaries have obtained the majority of representatives from the whole country.

"What consolation there is for me is to know that the Province of Quebec has remained faithful to us. . . . My regret, tho profound, is not for personal reasons. I regret not only the defeat of the Government, but that the country will be led to the rejection of reciprocity. Our relations with the United States have always been cordial. I do not know what the effect of this will be on them. We have tried to make them most cordial.

"My heart beats strong as ever and I can hold my head as high. The Liberal party has received a check, but it will continue its work. The only thing I ask is that you do not lose courage. If I were twenty years younger I would be in the breach, and even as it is I cannot say what course I shall take. . . . We have received a check, but we will come again to the fight."

The Ottawa *Free Press* (Liberal) suggests that Mr. Borden appoint Sir Wilfrid Canadian High Commissioner at London. Many believe that the new Premier will heed the suggestion of the *Free Press*.——On Tuesday night a reception was given to Mr. Borden at Ottawa. Among the leader's promises during the campaign were the creation of a tariff commission, an independent commission to operate the Hudson Bay Railway for the Government, the expropriation of all the terminal grain elevators and their operation by the Government; the control of the chilled meat industry, involving the operation of Government abattoirs; the construction of the Georgian Bay Canal, road construction in the West, and the establishment of a comprehensive system of agricultural education.

**The British View**

The Conservative victory in Canada caused general surprise at home and abroad. In Great Britain it was welcomed as presaging closer trade relations within the British Empire, altho Mr. Lloyd-George recently said that he would welcome the letting down of the bars. Canada's vote against reciprocity deprest American stocks on the London market, and affected Canadian Pacific similarly. Under the heading, "Dead and Damned," W. W. Astor's *Pall Mall Gazette* said:

"Canada refuses to become her neighbor's hewer of wood and drawer of water. The people have risen to denounce the bribe and repudiate the treachery. The decision will arouse the imperialists here."

The London *Globe* similarly says, "Imperialism has won," and Mr. Joseph Chamberlain has issued a statement expressing his gratification at this "victory for imperial preference."

*

**America's Standpoint**

The tariff reductions provided by the reciprocity agreement as voted by the American Congress were not to become effective until after Canadian ratification. The one exception was the wood pulp and paper schedule, which by special provision went into immediate operation, and is now the law of the land. The opinion exprest at the State Department is that no effort will be made to repeal the reciprocity act, and, altho the duties therein provided will not become effective, the act itself will be permitted to remain on the statute books. Mr. Taft heard the news of the defeat at Kalamazoo, Michigan.

"I have just been informed that reciprocity has failed in Canada," he said. "For me it is a great disappointment. I had hoped that it would be put through to prove the correctness of my judgment that it would be a good thing for both countries. It takes two to make a bargain, and if Canada declines we can still go on doing business at the old stand."

At Nashville, Tenn., Champ Clark, Speaker of the House of Representatives, was asked if his remarks about annexation had not aided in the defeat of reciprocity by Canada. He issued the following statement:

"My remarks about annexation did not do half as much to defeat reciprocity in Canada

as did President Taft's speech, in which he insisted on hurrying up agreeing to reciprocity in this country before Great Britain could establish her imperial policy of tariff with preferential rates for the colonies. He and I were both quoted by the anti-reciprocity crowd in Canada, he more than I; but the chances are that the quotations from his speeches and mine did not have half so much to do with defeating reciprocity as did the corruption funds sent from both this country and Great Britain into Canada."

At Washington it has been suggested that the only chance for the continuance of reciprocity as an open issue might be found in an attempt by Newfoundland to secure such a treaty of agreement with the United States. The Newfoundlanders were only awaiting the disposition of the compact between the United States and Canada to open negotiations with Washington for a reciprocity arrangement on their own account, and State Department officials say it has been difficult to keep them from pressing the matter while the Canadian agreement was pending. It is just possible that the Newfoundlanders may see their opportunity in the present situation and decide to renew overtures for an agreement on the lines of the ill-fated Hay-Herbert treaty of 1902. This treaty is still regarded by State Department officials as a model instrument, providing for the admission into Newfoundland of many American materials and manufactured products and the enjoyment of free fishing and bait by Americans in return for a free market for Newfoundland fish.——It is predicted that an effort will be made at the next session to accomplish thru tariff legislation what was to have been accomplished thru the reciprocity agreement. This agreement was supported by Democratic Congressmen on the ground that it provided lower tariff duties on articles imported to this country from the Dominion of Canada. They seized upon the recommendations of the Administration as being in line with the Democratic policy of reduction of schedules. Practically the same ends may therefore be accomplished by tariff bills which would provide for lower duties on Canadian importations, or for the free importation of many articles coming from that country, altho there would, of course, be no compensatory reduction on Canadian importations of our products.

**In New Jersey**

Speaking in Newark and Orange, N. J., September 22, Governor Woodrow Wilson said that, judging by the thousands of sample primary ballots that have been returned, he feared that his own election might have been brought about by fraud. He said:

"It has been said that I profited in the election by this fraudulent vote. I am afraid it is true, and if I had the opportunity I would change it at once, no matter what the cost. It makes me hot all over to think I was in part elevated by contemptible fraud, and if there is any way the office can be vacated I invite the process at once.

"I don't want office except with the honest votes of the people. If we can't have a free and open ballot we shouldn't have any. I don't want five spook votes to offset my one."

Many of the 11,000 alleged voters whom the Post Office could not locate in Newark were registered from vacant lots, and scores of persons were in some cases registered from houses where only one or two legal voters resided. Governor Wilson's declaration is seized upon by critics of the Geran law of last winter as showing that the new legislation facilitates more such illegal voting, for it gives to persons whose names appeared on the poll books at the last regular election the unqualified right to vote at the ensuing primaries, and provides no method whatever by which the poll books may be revised or corrected. There is a provision by which registry lists may be revised by striking off names improperly placed thereon, but the poll books are not subject to such revision or correction. New Jersey is agitated this week over primary elections for municipal offices. The fight in Jersey City is especially keen.——Governor Wilson, of New Jersey, was asked, September 20, to use his influence to settle the strike of the Lackawanna Railroad trackmen. Governor Wilson wrote a letter stating that the strikers' demands appeared "just and reasonable" and condemning the company's stand refusing arbitration. The Governor wrote to Gen. Lewis Bryant, head of the State Department of Labor, and told him to see if he could not help the strikers.——A strike of the coal-wagon drivers, belonging to the International Union of Teamsters, led to disorder in Jersey City, N. J., last week. The fight was among members of theirs and of rival organizations.

**The Coming Election in Mexico**

It is now expected that Madero will be elected President of Mexico almost without opposition, for General Bernardo Reyes has asked his followers not to vote. He said, in a statement published on the 22d, that the country was not peaceful, and that voting on October 1 would not be legal. Therefore he urged his supporters not to go to the polls. By resorting to arms, he continued, he could overturn the existing Government, but he did not intend to take such a step. Madero's comment was that this was Reyes's confession of failure to organize a party. But he did not think Reyes would tamely submit to defeat. "The people," he added, "will know to whom to adhere, and whatever may be the plan of General Reyes it will fail, because those of us who have fought for liberty will know how to guard against any weapons he may employ." Reyes's campaign committee said it would continue its work. The evolutionist party decided not to vote, unless the election should be postponed. Granados, Minister of the Interior, in a report to Congress, said there was disturbance only in Sinaloa and Chiapas. It was not of such a character that it called for postponement of the election. In the House, a committee reported against postponement, saying it would cause bloodshed and that the reasons given in the petition for it were trivial. It was said that a majority of the Senate desired postponement for two months. Minister Granados predicted the election of Madero and Dr. Francisco Gomez, saying that Suarez (on the Madero ticket for second place) was not well known. The Catholic party will vote for Madero and De la Barra, altho the latter declines to be a candidate. Some fear that after the election of Madero the followers of Reyes will join the Magon Socialists in a new revolution.——The Zapatists have not been subdued. They sacked a town in Puebla last week. In another place Maderists attacked them and sixteen were killed. Magonist bands have been raiding ranches and farms in Texas, near the Rio Grande. Magonists appeared last week for the first time in the State of Vera Cruz, attacking the town of Acayucan.——Lord Cowdray (Sir Weetman Pearson) desires, it is said, to sell his valuable oil properties to an American company, fearing that the new Government will regard with much disfavor his exclusive franchises, which were granted by Diaz. Madero's legal counsel in Washington recently asserted that the Standard Oil Company was negotiating with him by means of the Texas Oil Company. The Standard says now that it has no interest in that company. It is said that two representatives of the Standard are now examining the Pearson properties in Tampico.

**Cuba and Other Islands**

Evidence that the battleship "Maine" was wrecked by the explosion of a mine is quite clearly shown by the removal of the mud in which the hulk was imbedded. The ship's double bottom and keel were forced upward and are 28 feet above their natural position. ——Engineers say it would be profitable for our Government to raise the three battleships and two torpedo boats of Admiral Cervera's Spanish squadron which were sunk near Santiago. There is money in the ships' safes.——Gen. Antenor Firmin, the rival of General (now President) Leconte in the recent Haytian revolution, died in exile at St. Thomas on the 19th. As a revolutionist leader nine years ago he was exiled by President Nord Alexis. When Simon drove Alexis from office he became Minister to Great Britain. He left this post at the beginning of the revolution against Simon, and a part of the rebel army was loyal to him, but a majority supported Leconte.——Owing to abundant evidence that Cuba's national lottery impoverishes the laboring classes and causes much distress, the Government is considering a gradual abolition of it. The Government's profits last year were $3,300,000, including $200,000 in prizes on $500,000 worth of unsold tickets. This was about one-tenth of Cuba's entire revenue.——The Spanish Minister at Havana has obtained permission for the return to Cuba of the two Villaverdes, editors of a newspaper, who were deported in August, by order of President Gomez, as "pernicious foreigners, actively hostile to the Government."

**South and Central America**

Argentina's new battleship, the "Moreno," larger and more powerful than any other Dreadnought (her companion ship, the new "Rivadavia," excepted), was launched on the 23d at the New York Shipbuilding Company's yard in Camden, N. J. The "Rivadavia" was built by the Fore River Company, at Quincy, Mass.——Peru has ordered the construction of seven submarine torpedo boats by an American company.——Emigration from Italy to Argentina having been checked by the Italian Government, owing to a quarrel about quarantine regulations, Argentina's supply of workmen for the harvest season of November, December and January will be greatly reduced. It has been customary for at least 50,000 Italians to come for the season, a majority of them returning to Italy at the end of it.——An American company has begun to build a railroad, 400 miles long, from the Brazilian port of Paranagua to the boundary of Paraguay, where it will connect with a road to be constructed by the Argentine Government. The concession for this road in Brazil was granted to Capt. M. D. Sheehan. Products of Paraguay and Bolivia will be carried on the line to the harbor of Paranagua, and connections will permit thru service from Paranagua to Buenos Ayres.——Following the discovery of a revolutionary plot in Salvador, several prominent residents have been arrested. They had conspired to assassinate President Araujo and were taken into custody on the day before the one chosen for his death.——A cyclone at Corinto, the Pacific seaport of Nicaragua, on the 12th, destroyed 250 buildings, causing a loss of ten lives and $2,000,000. Piers were wrecked and the custom house was flooded.

**Railroad Strike in Ireland**

While the Royal Commission is in session at London, taking evidence as to measures for the future prevention of railroad strikes, the Irish roads are tied up by a spontaneous and unauthorized outbreak that is hard to quell. The trouble originated at Dublin, in the refusal of two of the employees of the Great Southern & Western to handle timber shipped by a firm whose men had struck. They were discharged, but others took up the quarrel, and the union approved their stand. The railroad companies refused to treat with the unions and held that as common carriers they are legally bound to accept all goods offered to them without discrimination. The executive committee of the Amalgamated Society of Railway Servants came over to Dublin and called a general strike to compel the companies to reinstate the men dismissed for declining to handle "black-leg" freight. The engineers and firemen on the Midland Great Western refused to obey the strike order, but the most of the employees on trains and at stations of the Great Northern and the Great Southern & Western quit work, and few trains were run on these roads. Hundreds of passengers arriving from America on White Star steamers were held up at Queenstown, and those intending to embark at that port were unable to reach it. Tourists were able to get around only in motor cars. Poultry, eggs and butter, to be shipped to England, remained stacked in stations or sidetracked in cars. The effort to import free labor was not generally successful. Fifty strike-breakers were imported from Manchester, but only nine were able to get past the pickets and enter the Kingsbridge station. A body of forty strike-breakers from Scotland arriving at Dublin were attacked by the strikers and with difficulty protected by the police. Men who continued at work in the stations and works were boycotted. Shopkeepers refused to sell them food and at school the children of the strikers refused to sit with them. The Government is affording as complete protection as possible with the troops and police at its disposal, and Home Secretary Churchill has issued a circular advising the registration in every locality of suitable persons who may be called upon in an emergency to serve as special constables.

**Collision with the "Olympic"**

As the White Star liner "Olympic" was setting out from Southampton for New York about noon of the 20th, it was run into by the British protected cruiser "Hawke" and badly damaged. The vessel was steam

ing than the Solent off Cowes when the "Hawke" drew up alongside and, suddenly turning in that direction, rammed her on the starboard about 100 feet from the stern. No official explanation has been given for the action of the cruiser, but it is surmised that her steering gear was out of order. The bow of the "Hawke" was badly crushed. A triangular hole was cut in the side of the "Olympic," extending from 20 feet above the water line to about the same distance below. The instantaneous closing of the doors of the water-tight compartments prevented the ship from sinking, so, altho the captain had at first steered toward the shore with the intention of beaching her, he found this unnecessary, and returned to Southampton. No one on board was hurt and there was no panic. The passengers, however, found difficulty in getting transportation to this country, for all lines are crowded at this season and the "Olympic" had on her passenger list a larger number than ever had gone across the Atlantic together. There were 2,085 passengers, 750 of them first class, including those who were waiting to get on at Cherbourg, and the crew numbered about 900. The "Olympic" is the biggest ship afloat and has only recently been put into commission.

**Strikes in Spain**

The revolutionary movement seems to have been nipped in the bud by the vigorous action of Premier Canalejas. The risings which occurred in Bilbao, Saragossa, Cadiz, Valencia, Seville and other cities are said to have been part of a concerted plan for the overthrow of the monarchy, arranged by a committee of anarchists and republicans meeting in Barcelona, September 14. Stores of revolutionary proclamations and bombs have been discovered. At Barcelona it was intended to blow up the public buildings and monasteries, and to assassinate Weyler, Captain-General of Catalonia. Señor Canalejas tried to check the strike in its inception by writing to the employers at Bilbao, urging them to make concessions rather than to have disturbances at a time when Spain was at a critical point in its foreign relations. At the same time he informed the labor leaders that he should recognize their right to strike peaceably, but that if any of the state employees struck without legal notification he would take the promptest measures to end the strike. The Central Labor Union ordered a general strike, but the response to this was not widespread, and in a few days it was over without much bloodshed. Only in the Province of Valencia were there attempts to seize political power. Mobs at Carcagente and Alcira took possession of the public buildings and proclaimed the commune, at the same time cutting off railroad and telegraphic communications, but the towns were soon occupied by troops. The centers of disturbance were put under martial law and constitutional guarantees suspended thruout Spain. At Madrid over 300 agitators and labor leaders were arrested and in other cities similar action was taken.

**Stolypin's Assassination**

Premier Stolypin died September 18 from the effects of the pistol shot received four days previously. The bullet had been deflected from its course by the Vladimir Cross that he wore on his breast, and at first his condition was so good that his recovery was expected. He talked cheerfully to his attendants and spoke kindly of his assailant. "The little fellow was awfully pitiful as he came up to me in the theater. He was pale and bowed—a sorry figure." General Trepov, Governor of Kiev, who was forced out of the Cabinet by Premier Stolypin by a threat of resignation, watched by the bedside with Mrs. Stolypin, and is taking an active part in tracing the ramifications of the conspiracy which led to his death. The revolver used by Bogrof was furnished him by the chief of the Secret Police for the purpose of protecting the Premier against an alleged attack by terrorists. Bogrof had been in receipt of a salary of $92 a month as police spy, and at the same time stood high in the councils of the terrorists. According to rumor they forced him to commit the deed under threat of death as a traitor to the cause. Premier Stolypin had issued a special circular to the police insisting that revolutionary spies were never to be em-

ployed as guards, but this warning had been disregarded. General Trepov had demanded the oversight of the protective measures during the Czar's visit to Kiev, and when this was denied he proffered his resignation as Governor, but this was not accepted. The chief of the Secret Police, Kuliabko, who had charge of the local arrangements and who called Bogrof into consultation on the police plans, was formerly a colonel in the army, but had been expelled in disgrace. The police department had expended $100,000 for protective purposes during the Czar's visit at Kiev. Since the late Premier had, through his incorruptibility and independence, incurred the enmity of the reactionary bureaucrats, it is suspected that they were not unwilling to have the wrath of the revolutionists directed toward him. Vladimir Kokotzoff, Minister of Finance, into whose arms Stolypin fell when he was shot, has been made Premier. He is a man of great ability, who has traveled extensively in Europe and visited the United States. He has had charge of the railroad development of Russia in the Near and Far East, and has brought the Imperial finances out of impending bankruptcy into a surprisingly satisfactory state. He is reported to be more liberal in his views than Stolypin, and especially more lenient toward the Jews. It was feared that the assassination of the Premier by a member of the Jewish race would cause a renewal of the anti-Semitic riots, and in anticipation of such an event over 12,000 Jews fled from Kiev. But the Government put 30,000 troops into Kiev and warned the authorities everywhere to maintain order. So far there have been no outbreaks of violence.

**Explosion of a French Warship**

The battle ship "Liberté" was blown up in the harbor of Toulon early in the morning of September 25 by the explosion of her magazines. There were 793 officers and men in the crew, and it is thought half of them perished. Some were on shore leave and some escaped by throwing themselves into the water. The cause of the accident is not known. The "Liberté" was one of the finest of the French vessels, constructed in 1907, at a cost of $7,000,000. It is known to Americans, as it was one of the three French warships sent to New York at the time of the Hudson-Fulton celebration. The French navy has been particularly unfortunate of late. The "Jena" blew up in the same harbor in 1907, killing 107 officers and men; the cruiser "Jean Bart" was lost off the coast of Africa the same year; two submarines have sunk with all on board, and several guns have exploded.

**Italy Claims Tripoli**

Germany and France have virtually come to an agreement in regard to Morocco. The terms are not known, but it is believed that France will cede about half of the area in the Kongo demanded by Germany, including access to the Kongo and Utangi rivers and to the sea between Spanish Guinea and Libreville. This will permit Germany to carry out her plan for an equatorial railroad from the Atlantic to the Indian ocean, crossing at right angles the proposed British Cape-to-Cairo railroad. On the other hand, Germany will renounce all political ambitions in Morocco and allow France, with the consent of the other Powers, to substitute her own courts for the present system of consular courts and to assume control of the foreign affairs of Morocco. This, of course, means practically the annexation of Morocco.——Italy is taking advantage of the opportunity to reassert her old claim to Tripoli. The claim originally included Tunis as well as Tripoli, for both had a large Italian population, but, in 1881, General Boulanger stole a march on the Italians by entering Tunis thru the back door. In compensation for this loss Italy took Eritrea and Somaliland, with the expectation, which was disappointed, of conquering Abyssinia, and France and Great Britain agreed to the annexation of Tripoli by Italy at some future time. Tripoli is about four times the size of Italy and has now a much larger Italian than Turkish population. If annexed it is expected that the streams of Italian emigration now going to America and Argentina will be diverted to Italian colonies in Africa. It was reported that a few weeks ago the Italian Government offered $12,000,000 for Tripoli, but this was indignantly refused by the Turks.

# Laurier's Defeat

BY EDWARD PORRITT

ON the eve of election day in the Dominion of Canada the most sanguine opponent of the reciprocity agreement—the *News* of Toronto—predicted a majority of nineteen for Borden and the Conservatives; and the *News* was not exultant or arrogant in tone when it made this prediction. Since election day the newspapers of both parties, and the bewildered politicians, have been trying to ascertain and marshal the causes which have given Borden and Foster, the Conservative leaders, a majority of forty-eight in the newly elected House of Commons, and thereby wiped out the reciprocity agreement. To do so involves consideration of the late Prime Minister and his beginnings.

Photograph by Underwood & Underwood, N. Y.

ROBERT LAIRD BORDEN, K. C.

The Conservative leader who will be the next Premier of Canada was born at Grande Pré, Nova Scotia, 1854, and was called to the Bar in 1878. He has been a member of the Canadian Parliament since 1896 and was elected leader of his party in the House of Commons in February, 1901, upon the resignation of Sir Charles Tupper

Now, Laurier used to be a democrat and a Liberal—a peculiar combination in a politician who is from Quebec and of the Church that is dominant in the French-Canadian Province. From 1887 to 1896, when he was leader of the Opposition at Ottawa, he was the hope of Liberalism in Canada and of Liberalism in England; and during those nine years there seemed abundant ground for the expectations which centered in the comely and eloquent French-Canadian lawyer, who, in close association with Cartwright, Mills and Paterson, was continuously battling with the privileged New Feudalism, and with the other forces of reaction—political and ecclesiastical—long entrenched at Ottawa. In these years Laurier could thrill an audience of Liberals in Ontario as deeply as Bright or Chamberlain thrilled the Radicals of Birmingham or Manchester. Under Laurier's lead from 1887 to 1896 Canadian Liberals followed a gleam. There was idealism in the Canadian Liberalism of those days. There was much of the spirit that had actuated the Liberals of Ontario who, earlier in the nineteenth century, had at much risk successfully waged the battle for self-government, and had thereby ended family compact and Downing Street rule in all British North America. During those nine years there was a Liberal opposition at Ottawa that counted for something. There was an opposition of which Macdonald and the other Conservative leaders were afraid, and which was able to some extent to check the reaction and graft of the Conservative Governments from 1878 to 1896. More-

over, there was a continuous propaganda of Liberal principles in at least five of the Provinces of the Dominion.

The culmination of this propaganda came in 1893 with the Liberal national convention at Ottawa—the greatest Liberal demonstration ever held in any of the four over-sea Dominions of Great Britain. The inspiration of this great meeting gradually diffused itself all over Canada. The general election which was thought to be at hand when the Ottawa convention was called did not come for nearly three years. But there was no evaporation of the enthusiasm born of the convention of June, 1893. The messages of hope sent out from that convention by Laurier, Cartwright and Mowat were the mainstay of Canadian Liberals when they went into the momentous election of 1896; and the result of this continuous propaganda of Liberal principles from 1887, and of the enthusiasm born of the famous Ottawa convention, was a victory for Laurier and Cartwright at the general election of 1896.

At the time of their downfall the Conservatives had been continuously in power for nearly eighteen years; and the work awaiting a Liberal Government was piled mountain high. Laurier was continuously in power from 1896 to the general election of a week ago; and at no time during these fifteen years had he the support of a majority of less than forty or forty-five in the House of Commons. But the work awaiting a real Liberal Government at Ottawa today is quite as large as it was when Laurier became Premier in 1896; and the difficulties in the way are today infinitely greater than in 1896, and the most serious of them are the creation of Laurier.

Liberalism was abandoned by Laurier as soon as he was in power. He and his colleagues—Cartwright, Fielding, Paterson, Mowat, Mulock and Sifton—in 1896 turned their backs on every principle that had been embodied in the Ottawa program of 1893. The big business interests from 1896 to 1911 fared even better with Laurier in power than during the eighteen years that the Conservatives were in control. Canadian manufacturers enjoyed a more generous protection in the tariff than from 1879 to 1896, while as regards bounties to the promoters of iron and steel companies, where the Conservatives had bestowed tens of thousands of dollars the Laurier Government lavished millions. It was the same with the promoters of railways, of steamship services, and of bridge and dry dock undertakings. The Roman Catholic Church in Quebec was as tenderly cared for by Laurier as it was by Macdonald or Tupper; and grafts on the Treasury and on the public domain have been as characteristic of Laurier rule at Ottawa as they were of the rule of any of the four Conservative Premiers who preceded him. There was not a gleam or spark of the old Liberalism at Ottawa from July, 1896, until January, 1911; and it was a peculiar combination of circumstances that led him in January last to revert to one of the old principles of Canadian Liberalism.

These circumstances—which today account for the fact that Laurier is no longer Premier—were the revolt of the grain growers of the West against the Dominion tariff, and Mr. Taft's overtures for reciprocity. Had there been no revolt of the organized grain growers of Manitoba, Saskatchewan and Alb against the high duties; had Laurier been daunted by the humiliating expe ences of his tour of the West in the sum mer of 1910, Mr. Taft's overtures woul have been declined. To accept the meant for Laurier a break with the n feudalism, to which he and all his leagues of the cabinets from 1897 been continuously and almost sub ently loyal. But the grain growers exigent in their demand for recipr as well as for an increase in the Br preference and for reductions all th the tariff. The grain-growing Provinces at this time returned twenty-seven members to the House of Commons. But all the increase in population in Canada during the last ten years has been in the Provinces west of Lake Superior; and it was expected that after the census of June, 1911, the reapportionment of electoral power would increase the number of members from Manitoba, Saskatchewan and Alberta from twenty-seven to forty or forty-one. The expectation last winter also was that this redistributi would be made before the gener tion.

President Taft's offer seemed no opportune for Laurier. He promptly grasped it, in the hope apparently that as he had been most careful in the negotiations for reciprocity to sacrifice none of the effective protection of any Canadian manufacturers, there would be no opposition from the Canadian Manufacturers' Association or the other big business interests.

But there is no gratitude in politics. The new feudalism uses a politician while he serves it; when he shows signs of desiring a little freedom it throws him over. This is what happened to Laurier. Hundreds of columns were printed in the Canadian newspapers explaining why the new feudalism objected to reciprocity; and thousands of speeches to the same end were made from platforms all over the Dominion. The most concise and illuminating explanation that has come to my attention is that of a Nova Scotia manufacturer of motors—Mr. Thomas Fraser, of New Glasgow—who was interviewed by the Halifax correspondent of the *Globe*, of Toronto, only five days before the election. "The first feature I see in the reciprocity agreement," said Mr. Fraser, who was in favor of the agreement, "is that you are going to show the farmers and fishermen just how much power they have; and unless they will use that power moderately and wisely it is all up with the protective tariff."

The new feudalism in the campaign that ended on September 21 used all its powers to defeat the grain growers of the West—to end the movement of the farmers of the older Provinces and the grain growers of the newer Provinces for lower duties on British manufactures and a general reduction thruout the tariff. It was not so much a fight against reciprocity as a fight against a movement for lower duties. There would have been no reciprocity agreement had Laurier foreseen that the new feudalism would desert him so promptly and so completely, and carry its great power over to the Conservatives.

It was the New Feudalism that raised the annexation cry, and infused into the campaign the rancor against United States by which it was characterized. It was the New Feudalism, that since 1897 has persistently and successfully assailed the policy of lower duties on imports from England, Scotland and Ireland, that raised and worked the cry that the British connection was in peril. It was the New Feudalism that put pressure on factory work people all over the Dominion to vote against Laurier; and it was the New Feudalism — always stridently imperial — that joined forces with Bourassa and French-Canadian nationalism, while it was throwing all the weight of its resources into the campaign in Ontario, which vaunts itself on being the most loyal to the British connection of all the Provinces, and where party lines today are those which came into existence on issues settled three generations ago.

In the face of these adverse conditions, due to the fact that the New Feudalism had ceased to have any use for Laurier, he failed to come back, failed to rekindle the enthusiasm for Liberalism and democracy which had carried him into power in 1896. Liberals the world over must regret the defeat of the reciprocity bill that was pending at Ottawa.

Apart from the disaster to reciprocity, it was just as well for Liberalism in Canada—and it is by no means extinct in the constituencies, tho dead at Ottawa these fifteen years—that Fielding, Paterson, Fisher, Frederick Borden, Graham, King and Templeman should end their parliamentary careers with the defeat of the Laurier government. Fielding, Paterson, Fisher and Borden were all of the Ottawa convention, and parties to the betrayal of Liberalism in 1897. Graham, King and Templeman, the other members of the Laurier cabinet who last week lost their seats in the House of Commons, endorsed the betrayal of 1897. There must now be a new Liberalism in Canada, with some reversion to the principles that Liberals professed before 1896, and the closing of the disappointing chapter in the history of Liberalism that began with the general election of 1896 and ended with that of September, 1911, will be the easier if the new Liberalism is free of the men primarily responsible for the betrayal of 1897.

HARTFORD, CONN.

# The Chinese Students in America

BY WILLIAM W. LOCKWOOD

[The General Secretary of the Young Men's Christian Association at Shanghai tells in this article about the work of the Chinese students who are being educated in this country. The writer has lived in China for seven years.—EDITOR.]

SAILING into the Golden Gate on the Pacific Mail steamship "Persia," on the morning of the 3d of September, were seventy-two Chinese students, bound for the colleges and universities of the United States. These composed the third annual deputation sent by the Chinese Government on funds accruing from the remission of the Boxer indemnity by the United States. Royal commissions or commercial deputations from any country in the world do not compare in importance with this group of modest, unassuming Orientals, because of their tremendous influence in the shaping of the future history of the Eastern hemisphere.

The remission of $13,000,000 of indemnity by the American Congress was not only one of the most magnanimous, but it has proved to be one of the wisest diplomatic moves ever made by any government. In appreciation of this friendly act, the Chinese Government is sending to America for study one hundred students a year for five years, and thereafter for twenty-nine years fifty students each year, to remain here for from five to nine years. Each summer, hundreds of young men, the chosen from the eighteen Provinces, travel to the capital city for the imperial competitive examinations. These cover questions on English literature, algebra, trigonometry, physics, American history, ancient history, Latin and one other modern language besides English in the classical course, in addition to a thoro grounding in Chinese, including history, literature and composition.

The renaissance of the ancient empire of China—political, industrial and educational, involving every phase of life, economic, social and moral, the passing of the ancient literary and impractical, and the adoption of the new, scientific and utilitarian, coming as it is with startling rapidity—is not the outcome of a sudden impulse, a wild obsession to copy the West and adopt Western civilization. These changes are the result of influences—commercial, military and moral—that have been brought to bear insistently and with increasing intensity for the past century or more upon an inert mass that until a decade ago had given little indication of being at all affected. In this change, soldier and sailor, merchant prince and missionary, each has had his part.

The first migration of Chinese students to America dates back to the early '70s, when the Peking Government, by a seemingly strange and momentary impulse, chose one hundred of her best sons and sent them to America to be trained in the learning of the West. They were placed in preparatory schools and later in colleges in New England. Many of them lived in the homes of the best New England people, and in this way came into close contact with American family life and institutions. Their eagerness to learn the West and conform to its customs and traditions proved in the end their downfall. While most of them were in college and some within a year of securing their degrees, representations were made to the conservatives in Peking that they were adopting the Western dress and customs and in some cases were even accepting the Western religion. When this was learned the appropriation for their maintenance was immediately cut off, and the students were provided with return tickets to their home land. Upon their return, instead of being received with honor and given official recognition and political appointment, they were looked upon with suspicion, and denied opportunity to use for their country's good the training received in their years of residence abroad. A few were offered posi-

tions as translators in the foreign departments of the most progressive viceroy's yamens, but even at this their stipends were so meager that it was impossible for them to support themselves without outside resource. Several remained in official service, but the whole Government system was against them to such an extent that they had no opportunity to exercise their abilities. As a result of this treatment, most of them entered private employment or began business for themselves in the port cities, where the increased commercial opportunities gave them open doors to wealth and position. That the Chinese Government did not believe the sending of students abroad a success is shown by the fact that no more were sent for almost forty years.

However, these "returned students" of the '70s and others who followed them to the States in succeeding years, supported by their own resources, are today potent forces behind the modern transformation of the empire. They are now recognized as indispensable to the ne régime and are occupying influential positions in the provincial and national governments. We find them on the imperial boards at Peking, particularly on the Waiwupu or Board of Foreign Affairs. Among the most conspicuous has been Tong Hyaoyien, a Yale man of the early '70s, who has been "the brains of the anti-opium crusade," the greatest moral reform undertaken by any nation of modern times. His Excellency Liang Tun-yen, another Yale man, for some time President of the Board of Foreign Affairs of the Imperial Government, has recently been appointed a member of the new Cabinet. Another man of conspicuous ability is H. F. Tong Kai-son, who was of that early deputation sent by the Government and withdrawn from Yale on the completion of his junior year. Tong is a man of deep conviction and an orator of ability. He represented his Government as one of the three commissioners at the first International Opium Conference, held in Shanghai in 1907. His eloquent and impassioned appeal to the Powers to assist China in her time of need, delivered in perfect English and republished and extensively circulated thruout England and Europe, probably did more to arouse the Government of England to favorable action in limiting the importation of opium into China than any other deliverance on the subject. Jeme Tien-yew, of the Sheffield Scientific School, who was chief engineer of the Peking-Kalgan Railway, the first in China to be built entirely under Chinese survey and direction, is now directing the construction of the Hankow-Chentu Railway—the Union Pacific of China. At one time recently the heads of the three largest Government institutions in Shanghai, the Shanghai-Nanking Railway, the China Merchants Steam Navigation Company, the Imperial Telegraph Administration, were Chinese who had studied in America twenty-five or thirty years ago. If America should never be able to contribute anything more to assist the Chinese Empire in its struggle toward the light, it has as a nation made an inestimable contribution by educating

Y. S. TSAO
De Forest Prize Winner at Yale

these men who are at this time such a power in the direction of this changing empire.

But the influence of these men of the present generation, widespread as it has been, will not compare in extent to that of the men who are today in the colleges of the West. Within the past few years the number coming to America has increased by leaps and bounds. In 1895 there were eighty Chinese students in the United States. Today there are 800—an increase of 1,000 per cent. in fifteen years.

What will these 800 Chinese be called upon to do for their native land? The men of the '70s have done much, but, as we have pointed out, their work was delayed for a quarter of a century and has been accomplished against the greatest obstacles, the strongest prejudice and in some cases against deep-rooted superstition. They have pulled against the tide. These men of the present generation will have the impetus of the tide behind them. There is no longer any question in China as to whether China will discard the old civilization which has endured without change for the past thirty centuries or more, and adopt the new. The new has already been adopted. The question as to whether China will ever change its system of education is answered by groups of modern buildings in every provincial capital, built in many cases upon the ruins of the old literary examination stalls. In these modern buildings instead of the old impractical three-legged classic are now being taught chemistry, physics, mechanics and modern languages. The question as to whether China will ever become a manufacturing nation is answered by the smokestacks that one sees on the horizon in approaching the port cities of the Empire, for in these factories are being produced cotton cloth, silk, flour, paper and other necessities of modern life. Will China's mines ever be opened and their treasure turned into gold to alleviate poverty and distress? In answer one reads a paragraph in the daily prints that the output of the Hanyang Iron Mills, located 600 miles up the Yang-tse River from Shanghai, is being shipped thru Suez, landed in Brooklyn and sold to advantage in competition

with Pittsburgh. The question as to whether the Chinese will ever depart so far from the well-trodden path of their ancestors and attempt a modification of their Government is answered by the first meeting of the Provincial Assemblies two years ago and the opening of a National Senate this past year, and finally the recent Imperial Edict announcing that, in response to the popular demand, a National Cabinet has been organized to replace the oligarchical Grand Council, this Cabinet to be amenable more or less to the Parliament chosen by the people. Such stupendous changes as this, involving the reorganization of the country from almost every standpoint, leaves no one in doubt as to the large place these men now studying in America will have in the future of the empire.

When one of these 800 students finishes his course in America and returns to China, almost upon the presentation of his diploma at Peking he is given political appointment. This is in accordance with China's ancient civil service. From this group of men and the several hundred now in England and on the Continent of Europe will be chosen the

future viceroys, governors of provinces, presidents of provincial assemblies, heads of provincial and of imperial boards of education, engineers-in-chief and presidents of railway systems, mining companies and steel mills, directors of steamship companies, and leaders in all lines of national and provincial development. The higher their scholastic attainments the better are the appointments to which they are eligible. It is not surprising, therefore, that their ambition is to remain in America until they have received not only their "A. B.," but have added to this their "A. M." and their "Ph. D."

Of 700 students in America concerning whom we have definite record, 323 are in universities, 72 in professional schools and the balance in smaller colleges. New York State has the largest number, 151. The largest number at any one institution is at Cornell, where there are 50. Columbia has 37; the University of Illinois an equal number; University of Wisconsin, 29; University of Michigan, 25; Harvard, 24; University of Chicago, 22; Yale, 16; University of Pennsylvania, 15. The remainder are scattered thruout many institutions East and West. Fifty-two of the number are women, and for them the favorite institutions are Wellesley, Wells and Radcliffe.

The special courses pursued by these students are an indication of the many lines of development for which China feels the need of experts. It is significant that most are pursuing technical and scientific courses, the favorite lines being civil, mechanical and electrical engineering, metallurgy, agriculture, finance, forestry and political science and government.

The Young Men's Christian Association believes so thoroly in the strategic importance of these men to the future of China that by means of a special department organized and operating in China, Japan, America and Europe, it cares for them and seeks to surround them with the best possible influences from the time they leave their homes until they get back to China. This work includes a bureau of information on higher education, located in Shanghai, a co-operation of the passport, tickets and wardrobe necessary for the journey abroad, a reception of the students along the way and particularly at the port of entry, and introduction into helpful relationships upon the threshold of college life. The co-operation of college presidents, faculty and students as well as the secretaries of the city and college Young Men's Christian Association has made this service possible. There was a time when the Chinese student could not feel he was welcome in America. This is not true today and there is a deep appreciation and a difference of attitude on his part as a result.

These sons of the Orient are intensely patriotic. They are loyal to China. They love their country more than they love their own lives. They realize that there is a great task before them in their native land and they are optimistic regarding the future. They are strong in scholarship, capturing scholastic honors in competition with American students. Within the past two years two have been elected to Phi Beta Kappa in Harvard and two in Yale. Mr. John Y. Lee, now an instructor in physics in the University of Chicago, has the peculiar distinction of being both Phi Beta Kappa and Sigma Xi. Hawklin Yen, who this year presented his doctor's thesis on Chinese Government at Columbia, is said by one of the professors of constitutional law and administration to have passed the best examination on every question propounded by the professors in charge. Dr. T. M. Lee, now a professor in the medical department of the Canton Christian College, two years ago took the prize in clinical medicine in competition with a graduating class of 114 at the Medical School of the University of Pennsylvania. Davis Yvi, with his master's thesis at Harvard, won the Bowdoin prize of $250 in 1910.

Some of these students have distinguished themselves in oratory. Mr. Y. S. Tsao this year captured the De Forest prize for the best oration among the seniors at Yale. This was his third successive victory, having won the sophomore and junior prizes on previous years. His oration this year was on the "Yale Spirit." Mr. V. K. Wellington Koo two years ago was on the debating team of Columbia which defeated Cornell. At different times the prize orators

at the universities of Virginia and Vanderbilt have been Chinese. Any one who has not been associated with these young men would be surprised at the facility and accuracy acquired by them in the use of the English language. When they learn English as boys they speak it without noticeable accent.

Into other lines of college enterprise the Chinese enter with enthusiasm. Several have had a part in college journalism, as V. K. Wellington Koo, who recently served as editor-in-chief of the *Spectator*, the Columbia daily. Their greatest lack, and they feel it keenly, is their handicap in athletics. However, they point with pride to the fact that at one time the coxswain of the Yale crew was a Chinese, Chun-Mun-yew, now a prominent official in the railway administration of China. One Chinese won a place on the tennis team that represented Amherst in 1916, and another was the proud wearer of a numeral on the freshman baseball team at Yale. One each at Harvard, Cornell and Columbia this year gained places on the 'varsity soccer elevens, and H. C. Tam, of Yale, was chosen for the All-America team. While many of them enjoy athletics and are enthusiastic in support of their college teams, yet they have not been able to rise above the disadvantage of not having received early training. Athletics have not been a part of their boyhood life. With those who come a few years hence this will not be true, for at the present time every college in China has its athletic teams, and last year the first national athletic meet was held in a central China city, when 140 athletes from all parts of the empire gathered to contest for the national championships. It is an interesting fact that one of the faculty of the new preparatory college, established in Peking to prepare these men for America, is an athletic director and coach. He will be expected to train the prospective

THE HARVARD CLUB: CHINESE STUDENTS AT CAMBRIDGE, MASSACHUSETTS

American students so as to acquit themselves with credit on the athletic fields of the American colleges. Those who are following the rapid development of athletics in China have no fear but that in another decade that country will not only have strong individual athletes who will make creditable records, but will possess athletic teams that will win honors in competition with the prize athletes of the West.

Never in history has one nation occupied the peculiar position of opportunity and responsibility with respect to another that America does to China. This is being met, first, by the establishment in China of colleges dominated by American ideals and manned by American college men; second, by opening the doors of our American colleges to the flower of China's youth and giving them a training that qualifies for leadership. It is singular that this young republic of the West is called upon to render this service to the oldest empire of the East. The new China may be going to England for a system of government, to Germany for military tactics, to Japan for a scientific terminology, but it has selected the American colleges as the training ground for its sons, into whose hands the destiny of the empire is fast falling. Something of this same service was rendered Japan to a limited extent during the changes of the past four decades. American colleges have never been without Japanese students, many of whom have had a great influence in shaping the new Japan. But where Japan sends students to this country by tens, China is sending them by hundreds.

These "returned students," as they are called in China, will be a commanding influence in the commercial future of China. They will naturally direct the channel of Chinese trade toward America. Learning civil engineering in this country, upon their return they will desire to reproduce the American railroad, and if met with favorable terms will incline to buy the necessary supplies from America. Studying mining engineering in the United States, they will naturally desire to follow the best precedents of this country in the working of the rich mines of China, and this will open the way for American trade. The American merchant could well afford, from the commercial standpoint, to pay from his own pocket the expense of the education in this country of these future leaders of the Orient, in view of their relations to the future industrial life of China.

As regards the future good will between America and China, these Chinese in our colleges are and will be increasingly a great factor. They will answer the question as to whether there will be future peace or war. The closest friendship at present exists, and no one who knows these men in China and as students in this country fears for a moment that they will turn against the country that gave them their training unless this be necessary in order to preserve their own national integrity. While loyal to their native land, they are without exception friendly to America. The Chinese gentleman holds his teacher in high esteem. Not to do so is inconsistent with the primal instincts of a gentleman. As one of these Orientals has recently said: "The United States is our mother —our alma mater; how can we talk of future trouble arising between us?"

Those men educated in the West will determine the question as to whether there will arise a Yellow Peril. The future peace of nations will depend as much upon China as upon any other Power, East or West. Will the army of five million which is projected as a part of China's future program, will the ironclads to be built as soon as China sets the national home in order, be a menace or a blessing? The question in the near future will be decided by these men now studying in the West—in America, in England and on the Continent of Europe.

In projecting Western education under American auspices into China, in establishing, equipping, manning and endowing colleges which are already doing a great work in that empire, and in properly treating and training these sons of the Middle Kingdom who are coming in such large numbers to study in our colleges, the United States is doing more to mold the East and to settle the future peace of the world as regards the Orient than can be done by any number of battleships, peace commissions, arbitration courts or international agreements.

Shanghai, China.

# Should the Ministerial Heretic Leave His Church?

BY J. ALFRED FAULKNER, D.D.

PROFESSOR OF THE HISTORY OF THEOLOGY IN DREW THEOLOGICAL SEMINARY.

IT is a favorite contention of some that ministers who have departed from the evangelical faith are under no obligation to leave the churches in which they were brought up, but that it is rather their duty to stay and either secretly or by open teachings undermine the old views and bring in their own. I must confess to some sympathy for these men. The ties which bind us to our ancestral communions where Providence has placed us are not lightly to be broken. Precious memories hold us to the old fold, and tender friendships almost as dear as life itself make a departure a poignant grief. Then a man who has received what he thinks a larger view may well think that he should first share his blessing with his own people, and bring them up to the hights on which he sits in the light. Besides, the Church herself has duties of tolerant kindliness toward her own children. Will she cast them out without grave reason? Even if they have gone astray doctrinally, is not that the greater reason why she should seek to enlighten them and bring them back? If she invites the weary and heavy-laden sinner who is outside to the healing arms of her Christ, will she be less generous to her own faithful ones whom she thinks have yielded to theological temptations, temptations which, coming under the high-sounding names of "science," "assured results," "modern enlightenment," are most subtly ensnaring? It must also be remembered that much new theology, especially as held by young men, is not necessarily final convictions, but it is a tribute to loved teacher by academic loyalty, or is timidity before new shibboleths like "science" or "the majority of critics" or is a lack of sufficient or patient induction. God speaks elsewhere than in the class-room, and life may do more for the young man than the seminary. For these reasons I think it will be agreed by all that neither the theological insurgent nor his Church should seek to dissolve their mutual relations for any but serious reasons, for variations alone which destroy its foundations.

But even for these reasons should there be a change, or should the old relations still hold? That is the question. As a progressive conservative I hope to speak of this matter without bias, and I trust my liberal friends will not accuse me of narrowness when I show that there may be situations when the above question should be answered in the affirmative. As I see the discussion there are two considerations which are determining—the religious and the ethical.

Our Protestant-Evangelical Churches have been founded on religious conceptions which have been the light of their life. Tho proclaiming the right of private judgment, as over against a mere external authority, like pope or council, that would lord it over the conscience, they have held to doctrines which have explained both their being and their growth. The Unity of God, the Deity of Christ, the immediate contact of the Holy Spirit on the soul, the Atonement, conversion thru faith in Christ, the unique religious inspiration of the Scriptures and their authority as a rule of faith and practice over against other rules, such as councils and creeds, and the decisive character of this life under the light of Christ—these and other doctrines have been not only held but they have been the very food, atmosphere, strength of these churches. Remember, I am not speaking of theological definitions or explanations, but of essential religious conceptions. These have made the churches what they are. Without them we would never so much as even have heard whether there was a Metho

dist, a Presbyterian, or other Evangelical Church. They have been their joy and glory, the secret of their life, the spring of all their activities both in home and foreign lands.

Now, a minister appears who has become so "liberalized" by the semi-Unitarianism in vogue just now that he is no longer in sympathy with the Christian confession as thus held and lived, and never will be. Shall he retire and go where he belongs? By all means. He is out of sympathy with the fundamental realities which have made his Church. If he succeeds in "liberalizing" it, it will be no longer a Church of the living God, but a club of people bent on self-improvement and the improvement of others—a very good institution, but not a Church of Christ, which is that and vastly more. If he is a self-respecting man he will go of his own accord. If not, the Church, after bearing with him patiently and trying to lead him back into her paths, should ask him to go to that body which has anticipated him by three hundred years. The Church has duties to herself, to her children, to the world—and one of her most imperative duties is to guard the truth as she has received it from her Lord and His apostles, the truth which, as I have said, has been her life and soul. Without that confession she would have no mission as a Church of Christ, no saving power among lost men. If, then, the man I am speaking of has no regard for this religious consideration, the Church should —not persecute him, not even deal unkindly with him, but point him to the place where without self-stultification he can be true to his new views.

This is really the method on which honorable men act in other relations. If a man insists upon coming into my house and teaching views about marriage, morality, etc., which would tend to disrupt the home, and, if he is not open to instruction, it would be my duty to ask him to leave and not return till he has come to a better mind. The Church is not a family in this sense, but she is the household of faith. A man teaching the American people that a republican government is not the true form, but that they should adopt monarchy, might, under certain circumstances, be fairly told that he better carry on his propaganda in Germany. A Socialist in the Democratic party who repeatedly tries to bring over his party ought to be borne with for a long time, but matters might come to such a pass that the party, in self-protection, might be compelled to send him over to his Socialist brethren.

There is also the ethical consideration. Some churches ask certain pledges or vows of incoming ministers. Perhaps they ought not to ask them, but that is not the question. It is to be presumed the Church thinks she ought to ask them. For instance, in my Church we are asked: "Have you studied the doctrines of the Methodist-Episcopal Church? After full explanation do you believe that our doctrines are in harmony with the Holy Scriptures? Will you preach and maintain them?" ("Discipline," 1908, p. 117). In the ordination of deacons this question is asked: "Do you unfeignedly believe all the canonical Scriptures of the Old and New Testaments?" (p. 404). In the ordination of elders: "Are you persuaded that the Holy Scriptures contain sufficiently all doctrine required of necessity for eternal salvation thru faith in Jesus Christ?" Also: "Will you be ready with all faithful diligence to banish and drive away all erroneous and strange doctrines contrary to God's word?" (pp. 397-8). Other churches have similar questions, no doubt. But if a minister comes to disbelieve in essentials, should he not keep faith with his Church? There is a mutual contract. If the Church has kept her side, should he not be true to his? If the Church has no creed, like the Disciples of Christ, nor has asked any pledge, she still has well-understood doctrines, and as a Church has stood on those doctrines perhaps with deeper emphasis and pride than churches which have a formal creed, and a minister in such a Church works just as truly under conditions of loving assent and allegiance. There is, then, an ethical consideration in this question which will grip the conscience of a true man with hooks of steel. Of course, if the Church waives the doctrinal test, that is another matter.

It may be said that the Church is in error, that the heretic has the truth, and

that she ought to give him a chance to proclaim it. But who is to be the judge as to truth and error? One man may be right and a thousand men wrong, but if we must have a decisive voice, perhaps that of the collective consciousness of believers may be as nearly right as anything available. "The Church ought not to throw a man out in the cold." She does not. With his changed views he may find it colder in the Church than outside. There is no State Church. Every society is on an equal footing. He is his own Church. No unkindness is done to him therefore if, having interiorly departed for good from the Church's life, she asks him the slight favor of exterior consistency. "But you would bar all progress in theology" Not at all. But the progress must be within Christianity and not outside of it, according to the analogy of faith and not contrary to it, an evolution and not a revolution. The Church is all the time appropriating new truth and occupying new points of view. Look at my own Church: Watson, Pope, Miley, Sheldon or Curtis—a positive theological advance of tremendous proportions. But it has been a progress in harmony with the Christian consciousness, and therefore it has classified and strengthened and not emasculated the Church. The truth shall make you free, but never from itself. "The Church should have no creed." She can't help it. A formally creedless Church is not really a creedless Church, but has doctrines most definite and insistent. But whether she has a formal creed or not, what she believes makes her what she is. A Church that believes the truth, or thinks that she believes it, is unworthy of it if she does not both proclaim and guard it in every proper way; and a Church that does not know the truth or does not know what she believes, and is therefore open to every wind of doctrine, is not only not a Church of Christ but is of all societies the most miserable.

PATERSON, N. J.

# The Submerged

BY MARGUERITE OGDEN BIGELOW

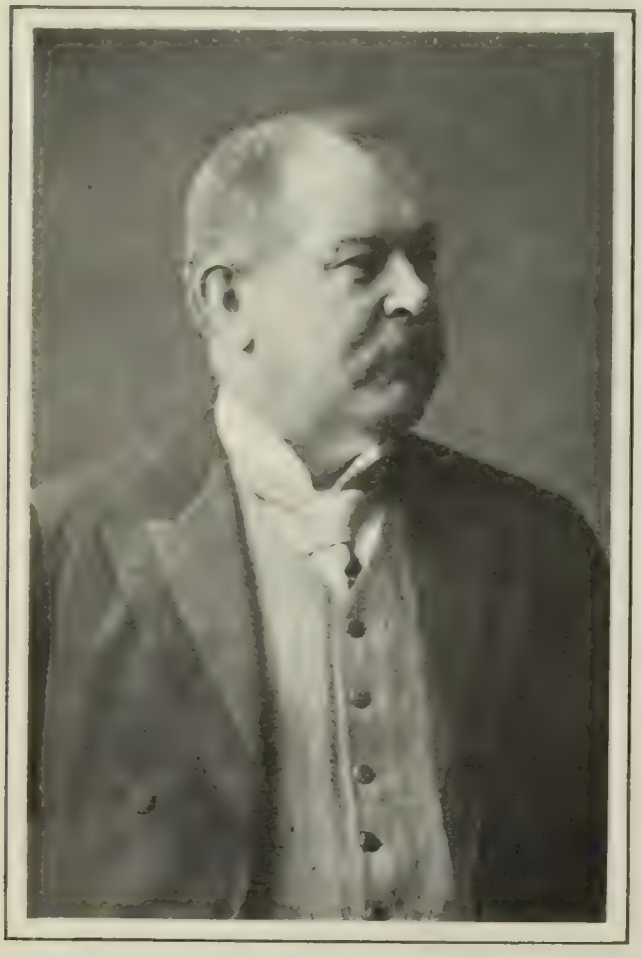
Under the pile I cry,
  Where my brothers press me deep—
For about me thousands die
  And beneath me thousands sleep—
Smothered and hoarse I cry,
"Let me up and out, let me by,
  Let me run where the free winds sweep!"

Under the pile I strain
  And my hands grow hot with blood
And my lips are parched with pain
  As I set my breast to the flood
Of corpses driven amain—
Those who have striven in vain—
  Down to rot in the mud

God! And if God there be,
  Can He deny at all
Entrance so poor to me?
  Sweating and torn I fall,
Dice of His lotteries,
Thirsting eternally,
  Bidden to drink His gall

Give me the Victor's arm,
  Then will I fight my way
Up from the death alarm
  Into the Victor's day:
Spare me the ultimate harm,
Grant me the Victor's charm—
  Or a little air, I pray!

And, if the Victor's chance,
  One out of thousands lost,
His mighty Circumstance
  Into my hands be tossed,
Emerging, shall I glance
Coolly, as in a trance,
  Back on the trampled host?



Under the pile I cry,
  Where my brothers press me hard
For about me thousands die
  And above the way is barred-
Smothered and hoarse I cry,
"Let the Victor pass us by
  Who can, with a soul unscarred!"

[illegible], Ct.

# England's Recent Troubles

BY JUSTIN McCARTHY

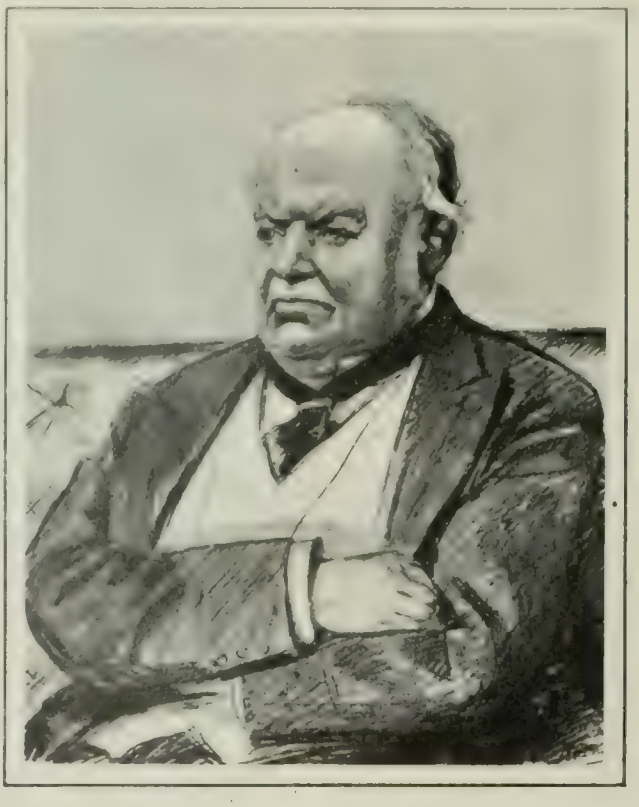
I HAVE lived thru some momentous periods of history in England, in England herself and in many other countries. The first eighteen years of my life saw the Irish famine and the outbreak and the suppression of the rebellion of 1848. But I do not think I ever before saw a time when the whole attention of the people among whom I was living, rich and poor, gentle and simple, was so entirely occupied with one subject as the attention of England was lately occupied by the railway strike. Even at the time when I am beginning this article we have the most authoritative assurance that the strike is absolutely over and that a full reconciliation of the contending forces has been absolutely secured and a new and most important era of Great Britain's domestic history has already practically opened. I find everywhere apparently sane and even reasonable acquaintances, who endeavor to convince me that, according to the words of a once familiar proverb, we have been raising our halloo before we are out of the wood. But while the strike was still actually going on, it appeared as if there were no other topic in home or foreign affairs which could claim for itself even a moment's consideration. A friend of mine had been to see the opening night of a new drama, on which, perhaps, he fully believed that the whole attention of the drama-loving public was absolutey riveted. I met him the same night, and I could hardly extract from him a single coherent sentence beyond a statement that he feared the manager had brought it out at a wrong time. "Nobody is talking or thinking of anything just now," he hurriedly explained, "except this terrible railway strike." So I endeavored to give myself up to the subject of the hour. Then it suddenly occurred to me that some audacious literary adventurer might convert the whole story of the strike and its consequences into an allegory with a highly moral purpose. Suppose he were to describe to the present generation of readers how it fared with another community which had abandoned itself absolutely to the influences of a great struggle the like of which had never been seen before between the employers and the employed The author of this venturesome allegory constructed for the conquest of his readers a community possessed by only one topic of interest. Suddenly, as if by the stroke of the enchanter's wand, a profound sleep seized upon the whole community thus organized and the land was for the time at peace with its neighbors and, better still, with itself. After the restoration of the enchanted community to life and to wakefulness not one of its members ever again had any recollection of the various economic subjects which had been actually distracting his

HERR VON KIDERLEN-WAECHTER
The German Chancellor and spokesman for the Kaiser in the Moroccan "Conversations"

life and the lives of all those around him, and they all found themselves restored to lives of entire tranquillity and consequent beatitude. The author of the allegory would have to be master of an extraordinary and indeed a rather more than merely extraordinary command over the intellects, or the substitutes for intellects, possessed by his readers if he could force on them the conviction that they have never heard of any such trouble and could never again admit any memory of it to distract their individual sensations. Naturally, however, the daily and the other newspapers did not regard it as any part of their business or duty to help to put life into such creation of allegorical fancy, and, therefore, for continuous weeks and weeks, they kept on supplying us with alarms about new threatened strikes and portentous warnings about the imminence of such convulsions.

Here I shall leave for the time this distracting question. Whether the strike movement is actually exhausted for the present or whether it is to break out into other even more perilous developments, it is quite certain that the American public will know all that can be known about the subject almost as soon as the public of Great Britain.

An American friend has sent me the following extract from the New York *Evening Post,* on a subject which, he tells me, is just now exciting much interest among readers in the United States:

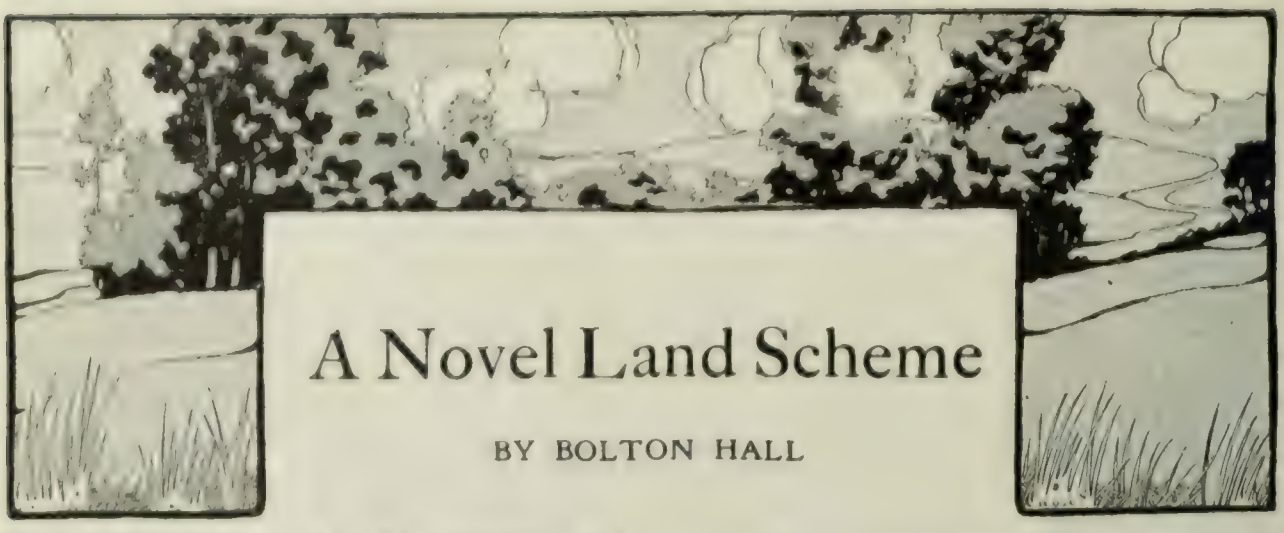


"The personality of the 'strong men' in both parties clearly illustrates the movement away from upper-class ascendancy in England. Only a few years ago the most dynamic figure among the Liberals was Mr. Winston Churchill, of whom it was predicted that a few years would find him Prime Minister. This would have been in accordance with the old traditions. For all his vehement radicalism, the fact remains that Mr. Churchill is the son of a lord and the grandson of a duke. But the prestige of that ardent young statesman has paled of late before the personality of Mr. Lloyd George, a man of the humblest origin, in temperament and outlook totally different from the older type of English Cabinet Ministers. The strong man of the moment on the Unionist side, in the recent flurry, was not Mr. Balfour, nor yet Mr. Austen Chamberlain, but a comparative newcomer in the person of Mr. F. E. Smith, whom a press dispatch describes as a man of 'no particular family.' And Mr. F. E. Smith like Mr. David Lloyd George, has little use for the old, bland methods of party warfare when men fought resolutely, but always with the consciousness that they were English gentlemen. English democracy was long content to be ruled by its social superiors. It is now beginning to choose leaders from among its own ranks. It would seem to be the day for the leader of 'no particular family.'"

RT. HON. F. E. SMITH, K.C., M.P.
A rising member of the Unionist party's parliamentary delegation

The writer in the New York *Evening Post* is fully justified in his views with regard to the movement away from upper-class ascendancy in England. But it is only right that I should direct the attention of my American readers to the fact that in the House of Commons, for many, many years back, we have had and have recognized as the leaders of great parties men who were not sons of lords or nephews of dukes or in any sense associated with or striving to identify themselves with the peerage and the aristocracy. I need hardly remind my readers that for many years Richard Cobden and John Bright exercised an influence over the House of Commons such as aristocratic parentage could never of itself have felt sure of com-

manding. In 1857, when he and Lord Randolph Churchill were rival candidates for the representation of Birmingham, Bright won a complete victory. My purpose in making these comments on the article in the New York *Evening Post* is only to point out that the dominion of the aristocracy over the House of Commons has never been absolute, or anything like absolute, within our own times, and that since the days of Daniel O'Connell, Ireland has always been able to exercise a thoroly recognized influence over the doings of the representative assembly. At the same time, I may also remind the readers of the New York *Evening Post* that the other cases to which the article refers do not by any means sustain the theory of the writer, for there was assuredly no family connection with lords and dukes to be discovered in the instance of Mr. Austen Chamberlain. My own conviction, after many years of close personal observation, was that aristocratic birth and family connections, altho having far too much influence in maintaining, and especially in obtaining, a place in the House of Commons were not necessary to secure for a man of genuine political capacity, whatever his birth or rank, the power of winning for himself a distinguished position and a genuine influence in the great representative assembly. The difficulties which seem to have come lately in the way of Mr. Balfour's influence over his own party do not come, I am sorry to say, from the intellectual capacity of the Conservative party, but only from a very natural doubt whether Mr. Balfour is really in heart and mind a genuine and devoted Tory of the old fashion. After all, we must remember that Disraeli himself, the sunlight of modern Toryism, was not the nephew of a duke or the son of a peer. One of the most successful members of the House of Commons in recent days was assuredly the late Mr. Roebuck, who, so far as I know, made no claims or had no claims laid for him to aristocratic connections or influence. I have for many years past seen with much satisfaction, and with even more hope, the evidences that the influence of aristocratic birth over the constitution and the proceedings of the representative chamber are steadily decreasing year after year. We know that these social distinctions of birth and rank, proclaimed to an only too observant community, must always, at least for some generations to come, exercise a deteriorating influence over the community, but is it, on the whole, any worse than that exercised by wealth?—and we know what an influence that was at one time in arranging for the composition of the House of Commons. Yet, despite of all these most dangerous and in their time really detrimental influences, we here in England have carried Free Trade; we have carried manhood suffrage; we are about to carry votes for women, and, as my readers of the United States have already learned, we have a government pledged to a measure for Home Rule for Ireland.



LORD HALSBURY
Leader of the "Last Ditchers"

We have lately seen in England the sudden start into life and movement of a new political party whose members have succeeded in conferring on themselves the title of "the die-hards." The

leader of this party is Lord Halsbury, whose previous political career passed with but little notice from the general public of England and Scotland, but who suddenly secured for himself the attention of our public by starting a new political movement of antagonism to Mr. Balfour, and to all the members of the Opposition who are inclined to accept him as their leader and of resolute or, rather I should say, roystering antagonism to Home Rule for Ireland. Now the party which Lord Halsbury has called into existence and which has already been making itself a political nuisance so far as it could thru England and Scotland, proclaims itself the unconquerable and immitigable enemy not only to the granting of Home Rule for Ireland but of every one at home or abroad who ventures to say a word in support of such a policy. I am, on the whole, inclined to hope that Lord Halsbury will carry out as far and as boisterously as he can his vociferations against Home Rule and against all his countrymen who acknowledge themselves as convinced or converted supporters of Ireland's national demand for a recognition of her rights to national self-government. I feel sure that even during the comparatively short period of his career, or attempt at a career, of political leadership, Lord Halsbury must already have filled the mind of many a thinking Briton with the conviction that there is a great deal to be said for the Home Rule cause which had never occurred to him before the noble lord had proclaimed himself as its passionate opponent. Everybody who has given much study to the passing course of political affairs must have seen or might have seen how often some really deserving cause is forwarded instead of being delayed by some utterly perverse and irrational attack of the typical Lord Halsbury. I therefore assure my countrymen in the United States that they may contemplate with entire satisfaction the part which Lord Halsbury has undertaken with regard to the cause of Ireland's great national demand. The effect of his performances will only be to help the movement which he had only hoped to hinder.

At last, however, we have got some news from abroad which has given our public something to think about, instead of, or as much as, the alarm about a possible renewal of the railway strikes. This is news contained in the accounts we receive from Germany about the powerful demonstrations made in Berlin in favor of a policy of peace. These demonstrations took the form of great public meetings in the imperial city, with the proclaimed object of convincing the German Emperor and his ministers that the heart and mind of Germany is now resolutely in favor of peace. For a long time there has been among most of the people of Europe a disposition, or indeed a resolve, to regard Germany as the great living representative of the policy of war and conquest. My first and my only expedition as the special correspondent of a London daily newspaper was made to Königsberg, in the north of Germany, on the occasion of the coronation of the then king, afterward the first German Emperor. I was then, as I have been ever since, a devoted admirer of the German literature, and I follow with intense interest the growth of Germany into a great united people. I was therefore especially cheered and delighted to find that just at such a moment as the present, the capital of the great Empire could thus emphatically proclaim itself in the face of the world as the advocate of peace. On the whole, I feel very hopeful about the results of the present crisis, at least so far as the attitude and the purposes of the German Government are concerned. I see good reason to hope that the ruling intellects as well as the public interest of Germany are not now to be reckoned among the promoters of war.

LONDON, ENGLAND.

# A Novel Land Scheme

BY BOLTON HALL

WE can't get rid of landlordism all at once, but we can get rid of the landlord right now, and that without becoming landlords ourselves, our own or anybody elses. It's a co-operative plan for taking what you make yourself—the land value—instead of handing it over to a land owner. Just a little Single Tax Colony at Berkeley Heights in Jersey, where the Tenants' Association owns the land, charges every one the rental value of it and pays the taxes with the proceeds. The remainder is used by the association for its roads, water supply, bridges and so on.

The Free Acres circular shows how they got the land. A reformed land-gambler owns some hundreds of acres there, and he calculated that the quickest and easiest way to bring population to his property was to give a part of the land to real settlers, not to other speculators. He comes in on that land value which has been calculated at $500 per man, which every one, however poor, unconsciously carries about with him. He wanted population as a merchant wants orders, so he consulted the authorities. "Twenty-seven miles from New York; two miles up hill from a branch railroad, without any river or lake," said the land agent. "Twenty thousand dollars' advertising wouldn't bring twenty families there in twenty years."

A GREAT PLACE FOR KIDDIES

But we got more than twenty families there in a year without spending as much as twenty dollars on anything. How? By offering them the use of land for what the use of it is worth. "Oh, of course," said Mr. Carnegie, when he heard of it, "if you get population you will get the land value." Thus he put his half billion forefinger on the secret of his prosperity and ours.

It did not look encouraging at first, but the aforesaid land-gambler thinks it such a success that he means to devote the overflow of Free Acres' "unearned increment" to establishing another Single Tax Colony. Except the idea of recouping the cost of the community land out of the increase in adjoining acres, the plan is not new. Fairhope, Ala., has been running sixteen years on that plan; it now owns about four thousand acres of land paid for by Single Taxers—to be sure, it has only some seven hundred people and not much land value yet, but what there is works all right.

Arden, in Delaware, also gained several hundred inhabitants by six years' active volunteer work, and is still succeeding. It has fewer laws and more liberty than Fairhope; and Free Acres has no laws at all, except the Arden rule, that if you make yourself so objectionable that two-thirds of your fellow lease-holders vote you out, then the trustees may cancel your lease. Even then you can sell or cart away your house.

So far, however, that has never occurred. People don't usually want to interfere with neighbors who don't interfere with them. You see, all the people have a common interest, to get as much rent as they can for their common needs, so they fix the rents as high as they can afford to pay—only twelve dollars an acre per year as yet—collect it themselves, and spend it for their own benefit; and so they like to make things pleasant.

They love their beautiful sixty acres of woods and fields among the Bernardsville Hills, and they give as much work as they can afford freely for the common weal. They are laying out the ball-field and digging out the pond already, and will make the tennis courts and open-air theater later, just as Arden has.

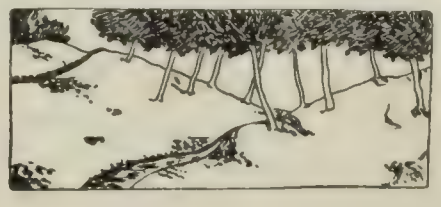
Of course it is pioneering. There is a good farmhouse soon to be run as an inn, but the new buildings are platformed tents or bungalows—not "villas" yet. The last of the mosquitoes have still to be drained away, but the colony grows. Arden already has a long waiting list.

THE OLD FARM HOUSE RENEWS ITS YOUTH AS AN INN

Of course, these places are not the "Single Tax," with its free trade and free land and freedom, but they are working models of its fighting turret—and there are more in preparation—a little one at Harvard Village, Mass., and a big one at Westbrook, Me.

At Free Acres, like the other model tax towns, most of the holders of the per

THE CHICKEN HOUSE IN THE BACKGROUND HAS BEEN MADE INTO A RESIDENCE



petual leases are people of moderate means. Indeed, I've noticed that altho the "average of wealth" is high, most people everywhere are of very moderate means; but there are arts and crafts people and literary and other self-supporting men and women and some who are "independently rich." However, rich or poor, they don't seem to want more than half an acre or an acre each. You see there is no land-grabbing possible. As the train service is bad for commuting, only a few come daily to the city. Nearly everybody cultivates a bit of a garden.

"The co-operative horse" was a great feature last year; he pulled a wagon twice a day from the railroad station up to the top of the 500 feet (fifteen cents a passenger for going up and ten cents for coming down). Besides that, he went to Plainfield, six miles distant, every week, and was further hired out for errands, for plowing, and for extra trips. He must have had the communal spirit, for he actually grew fat on it and paid a little profit at the end of the season. His photograph is on exhibition—we will have him again this year.

"Will it last, or will it break up like so many other colonies?"

There is nothing to "break up"; as long as one settler chooses to stay there it will last, for each one has a perpetual lease and can be entirely independent of the rest—if he chooses. Meanwhile here is one place at hand where, in truth, "the land shall not be sold forever," where it belongs to all the people themselves, on equal terms, those present and those to come, and fulfils Walt Whitman's ideal—"By God, I will have nothing that every one else cannot have upon the same terms." If you want to know more, "come and see." You will be welcome, and if you like it, you can get a foothold there upon the available earth as well as we.

PERKELEY HEIGHTS, N. J.

# Some Rights of College Students

BY THADDEUS P. THOMAS, Ph.D.

Professor of Economics and Sociology in Goucher College.

THE rights of college students are more important than those of professors or even trustees. This is because the trustees and professors, in their official capacity, exist for the sake of the students. During many years there has been a contest between trustees and professors to decide whether professors have a right to freedom of speech on vexed social questions. The problem can never be solved by debating the rights of professors, which occupy a secondary place, logically and chronologically. In order to solve the problem all professors must grant to students certain class-room rights, including freedom of speech. The professors can then consistently claim freedom for themselves. The main purpose of this article is to champion four class-room rights of students—the right to investigate both sides of disputed questions and to form opinions independently of the professor, the right to free discussion, the right to learn by these means the lesson of toleration, and, finally, the right to attain a progressive and truth-disseminating spirit. These rights will be illustrated by experiences drawn from teaching American history and economics, which furnish problems that tend to arouse prejudice, anger and intolerance, and so give a chance for an excellent sort of discipline.

"The saddest thing about your class in American history," said a disgusted student to me, while we were studying the sectional question, "is that we have to investigate both sides." Of course it hurt her, but the pains were growing pains. All students of social subjects have a right to that kind of growth. Such historical questions as the disputes leading up to the Civil War and such economic questions as the tariff, municipal ownership and trade unionism should be studied by reading a number of library references on both sides and forming independent conclusions. This right of students is conceded in most colleges.

Again, the students have a right to the benefits that come from free discussion. After they have informed themselves as to the facts and as to the arguments on both sides, it is well to encourage, in a guarded way, a candid expression of opinion on vexed questions. Well-informed, discriminating, dispassionate discussion is an admirable method for changing truth-seekers into truth-finders. But it is a method which cannot be practised without much preliminary explanation by the professor of the "rules of the game." One rule is that no student may participate in the game who has not undergone the preliminary training obtained by reading on both sides. Another rule is that lack of power to discriminate and to recognize at least some slight justification for the views of one's opponent, indicates incapacity for successful truth-seeking and excludes one from the game until he qualifies. A third rule is that a display of passion is an inexcusable "foul," which puts the player temporarily out of the game.

Discussion in its best form is impossible unless the professor has a democratic spirit. One of my own blunders illustrates this. When I began to teach I was a benevolent despot, with more despotism than benevolence. It is true that I cordially invited students to express their own opinions, but when one ventured to express an opinion which did not agree with mine I promptly knocked the life out of it and preached its funeral sermon on the spot. Other students took warning and carefully concealed their infant opinions. If one extreme in the class-room is the hot fever of passionate controversy, the other is the chill of professorial despotism, completely freezing out debate. I have learned many things in late years, one of them being the advantage of letting students refute each other's opinions. And when, as is often necessary and desirable, there is a controversy between a stu-

dent and the professor, the student should have a fair chance. In my own classes I give them the last word. This is not because they are women, and (according to the proverb) would have it anyway. It is because they are students and are at a disadvantage in contesting with a man who is not only literally but scholastically raised on a platform.

Let me admit that it is possible to carry the idea of free discussion too far, leading to a waste of time. And there are other reasons for its limitation, such as excessive belligerency on the part of some students who are fighting, not for truth, but for victory. And so the freedom of absolute democracy may be impossible in the class-room, but a limited monarchy is feasible, accompanied by an abolition of *lèse majesté*. The professor should be quick to acknowledge his errors and should award special honors to those students who prove that he is in the wrong. The professor who can learn nothing from the students is either remarkably wise or a very big fool.

What kinds of discussion are the most profitable? Those which involve the conquest of prejudiced feeling and those which involve the principle of merging a lesser into a larger loyalty. The democracy which will not learn these lessons must pay a penalty in treasure and blood. In a few years the question of capital and labor will be discussed as earnestly as secession once was. The vital question in the Civil War was whether *sectional* loyalty could be merged into national loyalty. Next comes the similar question as to whether *class* loyalty can be merged into national loyalty. And beyond that is the gigantic task of merging national loyalty into cosmopolitanism. The future leaders of thought who now fill our class-rooms must be educated thru the successive phases of loyalty—to the family, the locality, the state, the section, the nation and humanity—till they have a loyalty which is large enough to encompass the world. For the peace and welfare of the world depend on progressive education in accepting the larger forms of devotion without surrendering the lesser forms, and students have a right to receive such an education from teachers of history and economics.

And yet I once heard a lot of prospective professors of history advised, in an indirect way, to deprive the students of this right. The professor of history in a great university said to his class, of which I was a member: "Gentlemen, you may teach the history of the Civil War if you live far north of Mason and Dixon's line, or if you live far south of it, but if you are anywhere near that line you had better omit the whole subject." Now, much as I honored that professor, I finally decided to disregard his advice in teaching history in a college which is located about thirty miles from Mason and Dixon's line and which educates both Northern and Southern women. Here, somewhat hesitatingly at first, I tried the plan of an open forum in American history as long as I taught the subject (about twelve years) and I can testify that this method is not only perennially exciting but decidedly profitable. It would have been more profitable if I had not made the blunder already mentioned. I trust I may be pardoned if I now illustrate the difficulties and advantages of the method by some personal experiences, for abstract statements, unaccompanied by concrete experiences, would have little value.

Of course this method of teaching history is not an easy one, especially at first. As soon as the professor begins to discriminate he becomes a target for criticism from both sides. When the Northerners were saying that I was too favorable to the South, while the Southerners were declaring just the opposite, I felt a sort of melancholy pleasure at this evidence that I had been telling the truth. "What you said made me angry at first," was the comment of a Maryland girl, "but I feel all right about it now." "You are going to have trouble with me," announced a tall, kind-hearted, quick-tempered student from South Carolina. She really wanted to conquer her emotionalism and provincialism, but did not believe that she could do it. It is to her credit that she displayed only one audible ebullition of sectional feeling during the year. The Southern students are more impetuous and ardent in their partisanship. Most of them at first are proud of their narrow-mindedness. The Northerners, with some exceptions, are

serenely unconscious of their narrow-mindedness and believe that they love the whole country when they really love only one section and understand the arguments on only one side. "Why, I never dreamed that the legality of secession was a debatable question," said an astonished student from Kansas. The remark was typical.

In each class there were Southerners holding the belief that Lincoln was a tyrant who carried on a war which he knew was wrong. Seated side by side with them were Northerners who could not help putting Robert Lee in the same moral category as Benedict Arnold. A Kentucky student who was struggling toward broad-mindedness came to me in genuine distress and told me that she had learned something of Lee's nobility of character and said, "I want to admire him, but how can I admire a traitor?" Such questions present difficulties that can be avoided by those easy methods of teaching whose principal aim is to impart historical information. But information is the cheapest thing we can give students, while such questions as that of this Kentuckian afford an opportunity for them to learn the great principle of toleration and its practical applications, and that opportunity is one of the most valuable rights the student has. Let us first examine briefly the nature of toleration and then apply the doctrine to Lee, the so-called traitor, and to Lincoln, the so-called tyrant.

Toleration has been defined by Phillips Brooks as "the willing consent that other men may hold and express opinions with which we disagree, until they are convinced by reason that those opinions are untrue." Observe that the tolerant are free to argue earnestly against error, but may not become angry with the erring. Again, tolerance applies only to error and not to guilt, which should not be tolerated. Error is an unconscious mistake, while guilt consciously and purposely chooses evil. Error is intellectual wrongness while guilt is moral wrongness. Error needs enlightenment, guilt deserves anger and denunciation. This distinction is of the highest practical importance in the class-room.

How can the principle of toleration be applied to the secession of the South and the invasion of the South by the North? The best way is to show the students the motives of the honest people on both sides, best represented by Lee and Lincoln. Lee believed that Virginia was a State which existed before the Union and which, at the time of entering the Union, had reserved the right to secede, and that when she seceded her citizens were no longer citizens of the Union but were then bound only by allegiance to their State. Lee's conduct was the criterion of honor, and if he sacrificed the greater loyalty to the lesser he may have been mistaken but he was not stained by guilt. He said, "If I owned the four million slaves of the South I would sacrifice them all to the Union, but how can I draw my sword on Virginia, my native State?" On the other hand Lincoln, equally noble in character, believed that the Union existed before the States, that Virginia's reservation of the right to secede had no legal value, that the primary allegiance of all citizens was due to the Union and that it was his duty to enforce this allegiance. His magnanimity was such that Jefferson Davis said, "Next to the destruction of the Confederacy, the death of Abraham Lincoln was the darkest day the South has ever known." Such a man may have been in error, but was surely not wicked.

"How can I forgive a tyrant?" and "How can I admire a traitor?" are questions which are answered by saying that "we ought not to use terms implying guilt when we refer to Lincoln or Lee or the large majority in both sections who were sincere in their belief." Such, at least, was the reply which I offered to that earnest Kentucky girl, after I had first given her a little lecture on toleration. I was somewhat surprised at the promptitude and heartiness with which she accepted the new idea, while her face lighted up with a feeling of relief that she need no longer regard several millions of her fellow-countrymen in the South as wicked traitors.

With some of the other students I had poorer success. I realize now that it was largely my own fault that a few students in each class remained intolerant to the last. Fortunately, however, the large majority attained a tolerant spirit. As a good example of this I may quote, as well as my memory permits, the following conversation between a

Southerner and a student from Connecticut, the latter being the one who told me about it.

*Southerner:* I did not know until today that Lincoln told the South in his inaugural address that there would be no war unless the South began it.

*Northerner:* It was rash for South Carolina to begin it, but I find it hard to blame the rest of the South for resisting when Lincoln called for troops for the purpose of invasion.

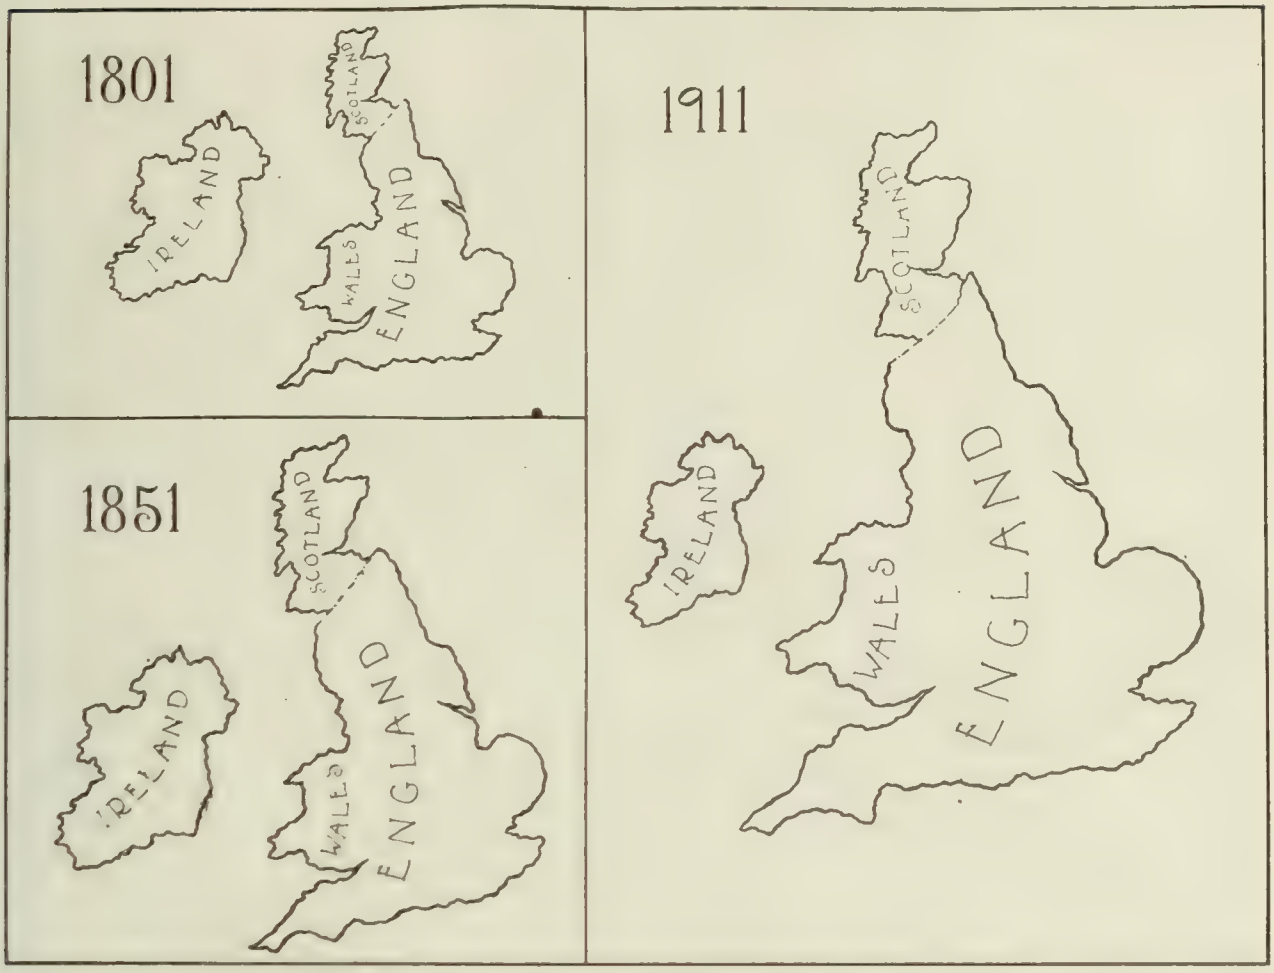
*Southerner:* Well, I am glad the North won, for otherwise both nations would have been cursed with a staggering burden of militarism. It is better to have only one great nation in North America.

*Northerner:* I, too, am glad the North won, for the nation is richer on account of Southern manhood and womanhood.

*Southerner:* I think you are a very decent sort of a Yankee.

*Northerner:* And I think you are a very decent sort of a Southerner.

Higher than the right to attain toleration is the right to attain a progressive and truth-spreading spirit. Toleration of error is a negative virtue, while propagation of the truth is positive and constructive. Toleration of error is static, propagation of the truth is dynamic. The student whom the truth has made free welcomes continuous social change. He cannot believe that the political and economic systems which have undergone ceaseless evolution thruout the past have attained their ultimate goal in the present year. "Whatever is, is right" is a social doctrine fit only for the millennium. Whatever is may be relatively right compared with the past but is relatively wrong compared with the future. The man who wants to keep social conditions as they are is a foe of truth and virtue. He calls himself a conservative, but his real name is obstructionist. He sees clearly enough that sectional prejudice was a mistake, but does not see that national prejudice is only a slightly more altruistic form of selfishness, a slightly enlarged variety of littleness. He sees that the determination of Southern statesmen to keep the institution of slavery absolutely unaltered was what hastened its abolition, but he is unaware that his own desire to keep the status of labor and capital unaltered will also provoke radical changes. He hates revolution but unconsciously hastens it. He sees the stream of progress moving forward and joins with his fellow-conservatives to build a dam to check its flow. He succeeds at first and rejoices. But when this method at a later stage results in a Johnstown flood, the stupid conservative does not know who caused it. And the ultimate blame for his ignorance rests upon the professors who taught him history and economics and neglected to convince him by countless examples that the methods of the obstructionist are unsafe and insane.



And so the highest of all the student's rights is the right to catch the spirit of progress, and to impart it to others. But there are two ways of being progressive —the revolutionary and the evolutionary. The revolutionary method is preferable to obstruction and stagnation. But it has grave disadvantages. "Revolutions never go backward," but the reactions that follow them always do. The most desirable method of progress is that of gradual but continuous evolution. And the highest, wisest function of the evolutionary reformer is leadership. The leader has been defined as "one who sees farther than the people see, but who does not go faster than they go." The radical reformer goes so fast and so far that he gets beyond the sight of the people. He goes alone and blazes a new route thru the forest. The evolutionary reformer comes after him and broadens this into a road over which the masses can travel. The impractical path-breaker and the practical road-maker have infinite scorn for each other, but society needs them both. Wendell Phillips was a radical reformer who called Lincoln "the slave-hound of Illinois" and refused to vote for him. Such men as Phillips and Garrison aroused the nation from its lethargy but could not lead it anywhere. It required evolutionary reformers to lead it out of slavery. And the twentieth century, like the nineteenth, is in need of evolutionary reformers and emancipation proclamations. Many hateful forms of bondage, which victimize men, women and children, are flourishing on a gigantic scale. Where are the leaders who will bring us to a realization that the mighty experiment called democracy is an assured success? It is the business of colleges and universities to train such leaders, and the best training consists of the free investigation and tolerant discussion of the past and present problems of democracy.

Baltimore, Md.

# Great Britain and Ireland

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

IN the chart the maps of Great Britain and Ireland are so drawn that their area is proportional to the population in 1801, 1851 and 1911. Their population at these dates was as follows:

| | England and Wales | Scotland | Ireland |
|---|---|---|---|
| 1801 | 8,892,536 | 1,608,420 | 5,216,000 |
| 1851 | 17,927,609 | 2,889,000 | 6,574,000 |
| 1911 | 36,075,268 | 4,760,521 | 4,381,951 |

The comparative growth of these three countries is most instructive. In 1801 the population of Ireland was over half that of England and Wales. In 1851 it was about one-third as great, and in 1911 less than one-eighth that of England and Wales. Ireland's population reached the maximum about 1841, before the potato famine and the great migration to the United States. Then it was nearly twice as great as at present. The loss in population during the last decade has been the smallest of any since 1841. It would not be surprising to find that since 1911 the population had begun to increase.

The population of Scotland in 1801 was only one-third as great as that of Ireland, but in 1911 it is nearly half a million greater. However, the rate of increase in Scotland is growing constantly less. England and Wales, on the other hand, which in 1801 had a population but a little larger than that of Ireland and Scotland, now have over four times their combined population.

The surprising fact is that while the population of England and Wales has increased over four-fold in a little more than a century, the population of Ireland has been constantly diminishing since the middle of the last century. Ireland is the only European country which has not shown a material increase during the nineteenth century.

# Literature

## John Bright

GENERATION after generation of our American high school pupils have been nourished on the eloquence of Burke, until teachers and parents have become so weary of that patriot that they are inclined to think heretical thoughts about his resounding periods. Mr. Barry O'Brien in this study of *John Bright** offers us a welcome alternative. John Bright was as eloquent as Edmund Burke. Indeed, in one respect he has been adjudged vastly Burke's superior, for John Bright always filled the House of Commons, while it is proverbial that the sight of Burke on his feet immediately emptied the chamber. John Bright used as pure and noble English; his speeches are models of strength and simplicity. In moral elevation and high resolve he was at least fully the equal of Burke, and if Burke appeals to Americans as the friend of the revolting colonies, Bright should equally appeal to lovers of freedom and of American unity as the champion of the right of this country to settle its own affairs without interference or intervention from Europe.

It is not a life of John Bright that Mr. Barry O'Brien has written; it is a study of his character, and of the nature and causes of the great influence he wielded over the political thought of England. In order to carry out this idea Mr. O'Brien has taken in turn each of the great and absorbing topics on which John Bright expended his eloquence and his strength. Beginning with the Anti-Corn Law agitation, he takes up in turn the legislation for the amelioration of Ireland, the Crimean War, India, the American Civil War, Canada and Confederation, and Parliamentary Reform; and in each case he traces Bright's leadership and speeches thruout the years that these subjects were before the country. On Home Rule Bright parted with the Irish Nationalists, altho he had been one of the most valiant friends of Ireland as regards land legislation and religious freedom. But even for his Home Rule heresies Mr. O'Brien can find excuses, and he makes it appear that it was the scanty measure of home rule provided for in the Gladstone bill of 1886, and the friction he foresaw as the result of such a half measure, rather than Home Rule itself, to which John Bright was opposed.

Some of the noblest passages quoted by Mr. O'Brien are from John Bright's speeches on the American Civil War. It must be remembered that, altho the English aristocracy and the landed classes, then overwhelmingly represented in Parliament and in absolute control of the Government, favored the South and showed a natural antagonism to the principle of democracy, which was on trial in the Civil War, the working classes, and especially the trade unions, were stalwart in their support of the North. John Bright was not standing alone in his championship of freedom against slavery, of union against disruption. It may be that Bright was mistaken in desiring to see Canada united with this country in one great nation. But it must be remembered that these were the days before confederation—before the statesmanship of Canada had successfully applied itself to the task of counteracting geography by protective tariffs. At any rate, no one can claim that it was indifference to the prosperity of Canada, or unfriendliness to the United States, that inspired the wish to which he gave utterance in a memorable speech made at Birmingham, on December 18, 1862. He said, after stating that the Chancellor of the Exchequer (Gladstone) had pronounced the cause of the North to be hopeless:

"I cannot believe that civilization, in its journey with the sun, will sink into endless night in order to gratify the ambition of the leaders of this revolt, who seek to 'wade

*JOHN BRIGHT. A Monograph. *By R. Barry O'Brien.* Boston: Houghton, Mifflin Co. Pp. xxv, 270. $3.

thru slaughter to a throne, and shut the gate of mercy on mankind.' I have another and a far brighter vision before my gaze. It may be but a vision, but I will cherish it. I see one vast confederation stretching from the frozen North, in unbroken line to the glowing South, and from the wild billows of the Atlantic, westward to the calmer waters of the Pacific main—and I see one people, and one language, and one law, and one faith, and, over all the wide continent, the home of freedom and a refuge for the oppressed of every race and of every clime."

There is as yet no adequate biography of John Bright. Mr. O'Brien's book does not in any way fill that gap. It is an admirable and sympathetic study of his influence and his character, but it does not pretend to give any connected account of his career. There will, however, be a warm welcome for this volume from the many admirers of John Bright who are still waiting for an adequate life of the patriotic English statesman.

## French Verse*

Amateurs of French verse will find at least three recently published books that they want for their shelves. Collectively, may these volumes not be taken to express a growing consciousness on the part of Anglo-Saxon readers that, supreme as is the English lyric, immortal tho Shakespeare is, and Milton, there are also wells of poesy on foreign soil?

Miss Smythe's volume is a contribution to the "New Medieval Library." Whereas the *Lyre d'Amour* and the *Oxford Book* are anthologies of the French verse, this is a collection of translations from the Provençal into English. Not all of these songs to fair ladies have been given a versified translation; where they have, however, the original structure of the verse (sometimes somewhat intricate) is reproduced, albeit the rhyming scheme is not generally followed. The translations are not distinguished. Not the least interesting pages are those of the introduction and the various condensed biographies.

Mr. Lewis's anthology of French love poems is divided into four books: *Le Moyen Age, Le Seizième Siècle, L'Age Classique, L'Age Moderne.* Eighteenth-century poets are included under the third heading. Thus there are only twenty-nine pages, representing eight poets, given to classicism. Probably this accords with contemporary taste. "It is to be regretted," the editor confesses, "that the selection should end about 1866, but despite all my efforts I found it impossible to get permission to print poems from Sully-Prudhomme and other modern authors whose works are still protected by copyright." The churlishness of the French publishers is, we are persuaded, ill advised.

And only four poets omitted from Mr. Lewis's anthology, presumably for this reason, are included in Mr. Lucas's. Two of these are, to be sure, Baudelaire and Verlaine; but we sadly miss Heredia and Sully-Prudhomme. The *Oxford Book* is of vastly greater consequence than any of its rivals of English publication as a repository of French verse, and it is, on the whole, representative; yet to the student at least it will seem strange that, while one hundred and twenty-four poems by François de Malherbe's predecessors are republished, and one hundred and three by Voltaire's successors, there are only ninety for the classical period and the eighteenth century. Obviously, the sixteenth and the nineteenth centuries are those which interest Mr. Lucas; and, on second thought, why quarrel with him? Most of us do return to these—whereas one reading will generally suffice for most of the great names he treats so cavalierly. We wish that the anthologists were more successful in writing introductory essays than are Messrs. Lewis and Lucas. They have made a brave effort to present reasoned historical surveys, but their work is not done with notable adroitness. In spite of them, we shall read and re-read their little volumes. And, for our own part, we postpone to a better opportunity the pleasant task of glorifying the poetry whose flowers they have gathered with love.

---

"Troubadour Poets." Selections from the Poems of Eight Troubadours. Translated from the Provençal with Introductions and Notes by Barbara Smythe. New York: Duffield & Co. Pp. xxiii, 197. $2.

Le Lyre d'Amour. An Anthology of French Love Poems from the Earliest Times Down to 1866. Selected and Annotated by Charles B. Lewis. London: Duffield & Co. Pp. xiii, 62. $1.25.

The Oxford Book of French Verse. XIII Century—XIX Century. Chosen by St. John Lucas. New York: Oxford University Press. Pp. xxxiv, 492. $2.50. (Other editions at 90 cents, $1.75, and $3.)

**The House of Hohenzollern: Two Centuries of Berlin Court Life.** By E. A. Brayley Hodgetts. With 16 Illustrations. New York: E. P. Dutton & Co. $5.00.

The essential theme of Mr. E. A. Brayley Hodgetts in his entertaining and gossipy book is the advent age of militarism in the training of the youth of a country, like Germany, which means to be strong, and the necessity of perpetual militarism in a country like England, which is already strong and can only stay so at the cost of Giles Ploughman's military fist. Born in Berlin in the atmosphere of the old Prussian army and court routine, first as a boy observer, then as Reuter correspondent in journalistic circles, Mr. Hodgetts finds himself attracted to the princes of the Hohenzollern line and their system of subsidizing the muscle and brain of a nation in the interest of a dynasty, of concentrating the energies of a great people in the mailed fist and educating their rulers to wield that redoubtable fist energetically, if not somewhat promiscuously. He construes defense as including offense, and delimitation of boundaries as translatable into expansion. In the princely House of Hohenzollern he finds the true military hero and in Prussia the efficient military power. It is difficult, he seems to admit, to make all the members of that house heroes in all senses and at all times. They have their limitations, physically and morally; very distressing limitations at times, considering that they were posing as defenders of Protestantism. They have their ups and downs in war matters. Their manly vigor, or "virility," did not always keep them from running away from the unmanly vigor of a degenerate opponent. On the chessboard of Europe castles were upset, knights unhorsed, bishops unfrocked, queens were helpless when they were good, and useful chiefly when they were naughty. The growth of the Hohenzollerns is followed up in the educational period and the back-stairs gossip rather than on the battlefield or in the council chamber, from the heroic repulse of the Swedes at the battle of Fehrbellin, in 1675, down thru the various Fredericks, Frederick Williams and Williams, and the author finds in them all the heroic quality, and in the common folk the possibilities of heroes, if only they are properly whipped into shape under the scourge—"*unter der Fuchtel.*" They were a hard lot in the beginning—that groundwork consisting of the common man. He may in that day, thinks the author, be regarded "as a brutish oaf, a loon or clown whose mentality was so little accessible to the rays of rational light that it could only be appealed to by means of concrete arguments" like the "stick or tawse." But the princes were, as a class, good fellows, tho seldom sober; perfect gentlemen, for the most part, tho sexual morality was somewhat at a discount in those early times, when Christianity was only seventeen centuries old, and when there was "scarcely a royal personage in the whole of Europe whose private life would bear investigation," as the author apologetically puts it. The Hohenzollerns were military models for a military people; bashful, and retiring sometimes, and sometimes justifiably pugnacious, it would appear. Thus, the first Frederick William, for instance, was so "shy in the presence of ladies that he blushed whenever a lady kissed his hand as a mark of respect," but he was a model of "manly exercises." He once "knocked down the young Duke of Curland"—who no doubt deserved it—"fell over him and pulled at his hair with both hands in the presence of his mother, without receiving more than a gentle remonstrance." Under these shy and gentle, moral and high-minded princes the military took form; the people were lifted; the ordinary man—the rail-splitters and tanners—became notably civilized; the "stupid German Michel" was transformed into an "intellectual giant," a "formidable and efficient engine of warfare," a "highly trained and cultured economic organism," big enough to lick his model, as he has several times tried to do.

**My Own Story.** By Louisa of Tuscany, ex-Crown Princess of Saxony. With 19 Illustrations. New York: G. P. Putnam's Sons. $3.50.

The autobiography of the erratic Louisa of Tuscany is a much more interesting document than most works of its kind. That is partly because it wears an air of informality and takes even the

untitled reader into its author's confidence. No fact is better suggested here than the tyranny of court and castle life—but that is an old story. The Dresden court circle "was composed," writes the former Crown Princess, "of the most narrow-minded, evil-speaking and conceited collection of human beings it is possible to imagine. I nicknamed it 'Noah's Ark.'" Worth a reading is the impression recorded by this free-spoken princess of the German Emperor:

"A most remarkable man; he can be very genial, but he possesses an iron and inflexible will. He is vain, and always wishes to be the first actor in whatever drama he plays, and altho he is an undoubted authority on military matters, he understands little or nothing about art or music, and his wonderful gifts are marred by his intense egotism. He can be equally charming or the reverse, and the reverse is not at all pleasant. His personal appearance is unique; he is well groomed, his expression is sympathetic and intelligent, and his marvelous eyes are truly the windows of the soul of this restless, brilliant, and strange man."

At the present moment the following paragraphs will, however, interest us more than these personal idiosyncrasies of royalty:

"If I had remained in Saxony, I think I should have been friendly with the Emperor, as I never shared the mistrust of him which seems to be the prevalent feeling whenever he is discussed. I am sure he does not entertain any real affection for England, and no people are better aware of this than the English themselves. Whenever he visits the English royal family, it is amusing to see how the newspapers dwell on the ties of blood which connect the two houses, but everybody knows that, *au fond*, William would never allow consideration for his mother's relatives to weigh one moment against the interests of his own country.

"I do not think there is any possibility of the 'great invasion' taking place for some time. The Emperor knows that the financial state of Germany is not favorable at the moment for war, and he is also fully aware that, even if the English army leaves a great deal to be desired, the navy is unspoilt, and England, even in her partial decadence, still remains the Mistress of the Seas."

**Corruption in American Politics and Life.** By Robert C. Brooks. New York: Dodd, Mead & Co. $1.25.

A study of corruption in American politics and life, running to 303 closely printed pages, is no more exhilarating reading than a dissertation on cancerous growths. Yet, as doctors dote on diseases, to the great benefit of sickly individuals, so muckrakers and reformers specialize on "corruption," to the obvious advantage of the community. Professor Brooks's treatment is severely scientific. He batters down with gravity and thoroness the flimsy defenses of corruption—that it is good for business, and that the corrupt are often efficient—which are sometimes desperately erected. He shows how persistent thru all times and under all forms of government the problem of corruption has been. He exposes with deadly impartiality the corruption in the professions, in journalism, and even, alas! in the universities. He traces elaborately the connection between faithless politicians and reputable business, and he examines, methodically and painstakingly, the laws and customs respecting campaign contributions. But, after all, he can show that our American loud-mouthed advertisement of our sins is no proof that we are worse than our more smug and quiet-mannered European contemporaries; and he closes with the reassuring declaration that "corruption is decreasing in the more progressive countries of the world." After all, despite the abundance of hospitals and the regiments of nurses, there are lots of healthy folks walking around.

**Anglo-American Memories.** By George W. Smalley. New York: G. P. Putnam's Sons. Pp. ix, 441. $2.50.

Mr. George W. Smalley, best known in this country for his many years' service as London correspondent of the *Tribune*, seems to have had a singularly happy experience of the newspaper world, and to have spent quite a large part of his life in a dinner coat in company with the great of the land. Almost the only ordinary people who figure in his pages when he is recounting his experiences of London and of the Continent, are two newspaper men who were associated with him when he was organizing and managing the cable correspondence of the New York *Tribune* at the time of the Franco-German War. For the rest Mr. Smalley's memories are of Bismarck, the Emperor Frederick, Queen Victoria, King Edward, Queen Alexandra, the Archbishop of Canterbury, three or four Governor-General

and quite a contingent of newly created members of the House of Lords, such as Lord Glenesk the owner of the *Morning Post* and Lord St Helier, more easily recalled on this side of the Atlantic as Sir Francis Jeune. Mr. Smalley writes entertainingly of them all, and not one of them who is still alive will find it in his heart to take exception to anything that is set down about them in these gossipy pages. They will go down into history, if historians ever consult Mr. Smalley, as great, brilliant, or of remarkable political achievements. Lord Randolph Churchill, for instance, is described as leading the House of Commons as no man had ever led it before, tho how his leadership, which lasted for little more than a single session, differed from that of other leaders of the Commons is not explained. Achievements are also attributed to the Earl of Minto, when Governor-General of Canada, which will surprise students of the constitutional history of the Dominion, who have been under the impression that Canada for nearly seventy years has enjoyed representative government, and that at any rate since confederation Governor-Generals have been little more than links of Empire, and of small political account at Ottawa. Adulation is the characteristic note of these personal sketches; and Mr. Smalley seemingly throve so well among these exalted people and was so socially acceptable to them all—including King Edward and Queen Alexandra—that readers may feel surprised that there is no intimation in Mr. Smalley's pages that a peerage or at least a baronetcy was ever tendered him. If he had received a peerage it is obvious that Mr. Smalley's place in the House of Lords would not have been on the Liberal benches. His sneers at Radicalism and dissenters, the aloof and superior tone of his remarks on the great dock strike in London of 1889, and on Cardinal Manning's bold stand for a living wage for the dock laborers, all make evident that Mr. Smalley's place would have been on the Tory benches of the House of Lords. It is a small and select circle with which Mr. Smalley's memories of London are concerned. Readers would never know from them that there was a larger London or an England outside London. Those, however, who delight in coming to close range with the great and brilliant—in the printed page—will read these memories from end to end.

**The Origin and Growth of the American Constitution.** By Hannis Taylor. Boston: The Houghton Mifflin Co. $4.

It is a pity that, in the dearth of good general histories on the origin and development of American institutions, the most promising looking volume of recent years should be from the hands of Dr. Hannis Taylor, who displays in all of his work the same qualities which he showed in his volumes on the English Constitution: neglect of the most recent scholarly investigations, perversion of materials by uncritical preconceptions, and sublime neglect of thorogoing research among original documents. This new volume, tho masking under a general title, is in large part a glorification of Pelatiah Webster and his plan for union. Hamilton, Madison, Pinckney and all the rest of the fathers derived their fundamental idea of a federal system from Pelatiah Webster; and the world never discovered it until Dr. Taylor made the revelation. It is the old story of a man who finds a piece of a truth which has been more or less neglected by others, and then by fine frenzy works himself into believing it is the whole truth; there is no use wasting printer's ink arguing with such an authority. Not content with this overexaggeration of the Pelatiah Webster thesis, which he uses for all it is worth thruout nearly 200 pages of his text, Dr. Taylor declares himself in favor of the Pinckney draft, drawing to its support, with his usual inaccuracy in such crucial matters, the authority of the learned Dr. Jameson, who, as nearly every scholar knows, never vouched for its authenticity. (See Farrand, "Records of the Federal Convention," Vol. III, pp. 595 ff.) The reason for this vagary soon becomes apparent: Pinckney did not copy his plan from the Constitution, but it was so nearly like the Constitution because he had borrowed it from old Pelatiah Webster! Fortunately for the reader, Pelatiah Webster did not live down to our own time, and consequently in the second half of the treatise Dr.

Taylor has to choose another topic. And here he writes in an interesting fashion, with considerable discursiveness and frequent reference to ancient Teutonic institutions, about slavery and its consequences, constitutional growth from 1804 to 1865, the Civil War amendment, our colonial system and the Monroe Doctrine, interstate commerce, and the outcome of our growth, which does not seem to have anything in it which was not anticipated by Pelatiah Webster (p. 468). The most valuable part of the volume is an appendix of important documents, including Pelatiah Webster's "Epoch-making Instrument." Retired lawyers and judges who divert themselves in their declining years with literary and historic excursions will probably greet this volume with enthusiasm. Doubtless the author will receive many more letters from distinguished persons (see p. 24) revealing to him the fact that his startling thesis is "as unknown to the leading jurists and statesmen of this generation as if it had been a papyrus from Egypt or Herculaneum."

## Literary Notes

....A new play by Mr. Henry Arthur Jones, "The Ogre," has been produced at the St. James Theater by Sir George Alexander. The London press is unenthusiastic.

....H. A. Guerber is the author of *Stories of Shakespeare's Tragedies* (Dodd, Mead & Co., $1.25): commonplace condensations of the plays for the composition of which we see no valid excuse.

....The style of Ruth Kedzie Wood's *Honeymooning in Russia* is so sprightly that there will surely be an audience for the book, which describes many interesting places, and is well illustrated. (Dodd, Mead & Co., $2.)

....Chemical and microscopic tests for distinguishing cotton and linen threads in mixed cloth are described and illustrated in Bulletin No. 7 of the Technical Education series published by Teachers College of Columbia University (25 cents).

The edition of Browning's *Paracelsus* published by the Baker & Taylor Co. is preceded by very reasonable essays on Paracelsus the Man and The Philosophy of Paracelsus and a Note, and followed by a General Review and a Glossary of Words and Allusions, all the critical apparatus being the work of Christina Pollock Denton. ($1.50.)

....*Miss 318*, by Robert Hughes (Revell, 75 cents) is a short story but has more genuine human nature in it than most novels of twice the price. Half a dozen other morals may be extracted from it beside the warning against late Christmas shopping.

....In his latest romance, *A Person of Some Importance* (Bobbs-Merrill, $1.25), Lloyd Osbourne has made an ingenious mixture of farce and melodrama, with the scene changing from a South Sea island to a New England village, and characters ranging from an emperor to a muleteer.

....A new humorous weekly, *Satire*, has made its appearance in New York. It is handicapped with an uncommonly ugly cover, upon which, if it endures, it must improve. There is plenty of room for *Satire*, if the editors (Mr. Walter Pulitzer is one of them) look sharp and see the opportunity.

....*Some Aspects of Thackeray*, by Lewis Melville (illustrated; Little, Brown & Co., $2.50). Here are fourteen agreeable essays on such subjects as Thackeray's Ballads, Thackeray and the Newgate School, Thackeray as Artist, Thackeray's Originals, Thackeray and the Stage, etc., by the novelist's biographer.

....The editor of the revised Hudson *Twelfth Night*, Dr. Ebenezer Charlton Black, tells us that the text of the play is, as compared with the original Hudson, "conservative." The Bowdlerized Shakespeare has its place, no doubt, and so this modernization ("The New Hudson Shakespare"; Ginn) will find its uses in the schoolroom.

....The movement for motivated training, now sweeping over the country, finds expression in a new organ, *Vocational Education*, published bi-monthly by the Peoria, Ill., Manual Arts Press at $1.50 a year. It is handsomely printed and contains, besides some leading articles, a valuable department giving reports of recent developments in this field from all parts of the world.

....To the series of freely illustrated horticultural books published by Doubleday, Page & Co. are added *Chrysanthemums and How to Grow Them*, by L. L. Powell; and *Vines and How to Grow Them*, by William C. McCollom. They have the merits of the series, which now includes about a dozen volumes at $1 to each. The instruction is full, as to both varieties and culture.

....Among the papers read at the last meeting of the American Sociological Society those of most general interest are Giddings's "Social Theory and Public Policy," Ross's "Observations on China," Howard's "Social Control of Domestic Relations," Wilson's

The Church and the Rural Community" and Vincent's "Rivalry of Social Groups." These and other papers and discussions are now issued by the University of Chicago Press in Vol. V of the Publications of the Society, $1.65 postpaid.

...Mr. Clayton S. Cooper gives an encouraging survey of Bible study among students the world over in his *College Men and the Bible* (Association Press). Of special interest are his illustrated chapters on the study of the Bible in India and the Far East.

What may be done toward making a village library a part of community life and the repository of its history is shown by the pamphlet *A Vermont Library*, compiled by John Cotton Dana and published by The Elm Tree Press, Woodstock, Vt.

....Many valuable suggestions for those dealing with boys will be found in *Boy Training* (Association Press), edited by Mr. John L. Alexander, and written by a number of men, each an "expert in his own line." The information given is reliable and the principles of development advocated are sound.

....Lecce is the "unknown city" described by Martin Shaw Briggs in the book entitled *In the Heel of Italy* (Duffield; $3.50). There are numerous photographs and drawings here, besides a map and an enthusiastic text. Historical record, travel-notes, architectural observations, all help to swell this account of a South-Italian town to almost 400 pages.

...."The Story of the Great West from the Time of Coronado to the Present" is the subtitle of Dr. Grace Raymond Hebard's *The Pathbreakers from Ocean to Ocean:* a compact illustrated narrative for the use of schools (Chicago: The Lakeside Press). It ought not to be difficult to hold the interest of a classroom where this is the textbook.

....H. F. Suksdorf in *Our Race Problems* (New York: Shakespeare Press) takes seriously the antiquated notion that races like individuals may be classed as young, mature and old, and on the basis of his theory argues for the exile of the negroes as the only alternative to the formation of a new yellow race in America which will reach maturity in 2700 A. D.

....Certain periodicals pride themselves on the peculiarity of their spelling, says the London *Chronicle*. The *Revue des Deux-Mondes* still clings to the orthography current at the time of its foundation, over a century ago. In its pages "savants" always figure as "savans," and "documents" as "documens." The *Times*, too, invariably spells "connexion" thus, and the Edinburgh *Review* slips a superfluous "e" into "developement."

*Herself*, by Dr. E. B. Lowry (Forbes & Co., Chicago, $1), is superior to most books of its class in that it uses plain language in discussing facts of woman's physiology and does not indulge in superfluous sentimentality or fads.

....*Our Country and Its People*. An Introductory Geographic Reader for the Fourth School Year, by Will S. Monroe and Anna Buckbee. Harper & Bros., 40 cents. This illustrated reader should interest the pupils whom it instructs. The use of the volume should bridge the transition from the oral teaching of the third grade to the book-study of the fourth.

A reader or small library that cannot afford to get *The Statesman's Yearbook* every year should at least buy the issue for 1911, for it contains the census figures for 1910 for the United States, Great Britain and other countries. No other annual gives in such small compass so large and reliable a mass of statistical, political and commercial information as this.

....The Cambridge History of English Literature has already won a place for itself on our shelves, and we welcome Volume VII, *Cavalier and Puritan*, treating of Cavalier Lyrists, The Sacred Poets, Milton, Caroline Poets and Divines, Bunyan and Marvell, Jacobean and Caroline Criticism, Hobbes, English Grammar Schools, The Beginnings of English Journalism, etc. We defer detailed criticism. (Putnam, $2.50.)

....Charles W. Collins's *Great Love Stories of the Theater: A Record of Theatrical Romance* (Duffield; $3.50) is a fairly entertaining rehash of familiar *liasions* of actresses, French and English, with rulers and poets, and of those of several actors with great ladies. We see no good reason for retelling the stories. The style is sprightly, but wants simplicity and good taste, to say nothing of correctness.

....We recall that President Woolsey, of Yale University, printed in a bashful sort of way a little booklet of his poems given grudgingly to a few intimate friends and not reached by the public. We have seen a similar thin brochure of *Attempts in Verse* by President Stryker, of Hamilton College (no name or date or price), written from 1895 to 1911, and the last a Latin poem in the *Dies Iræ* meter. Some of these verses have been printed in THE INDEPENDENT. The *Attempts* show success.

....There lie on our table several works of scholarship too specialized to receive more than a line of acknowledgment: *Studies in the Text of Lucretius*, by William A. Merrill. *The Critics of Edmund Spenser*, by Herbert

E. Cory. *The Separation of the Attributive Adjective from its Substantive in Plautus,* by Winthrop L. Keep (all three being publications of The University Press, Berkeley, California), and *Studies in Denominative Verbs in English: Inaugural Dissertation,* by Vilhelm Bladin (Uppsala, Sweden: Almquist & Wiksells Boktryckeri—A. B.).

....In Volume IX of Sir James Murray's *New English Dictionary* fasciculus *Team-Tezkere* contains 3,304 words, against 1,982 in the corresponding section of the *Standard.* Those of Old English origin are less numerous than Greek derivatives, for there are many compounds of Tele- and Tetra-. *Telepost* is not included here. Telegrapher is given here, as sole pronunciation, te-li graf'-er. This is not the American usage: *Standard* gives te-leg'-ra-fer the preference; *Century* prefers tel' e-graf-er. More than a page is devoted to *Team,* sb., but team in the figurative sense of an individual difficult to manage is not explained—not a very serious omission. *Tenderloin,* on the other hand, is defined not as steak alone, but also topographically.

....*Half a Man:* The Status of the Negro in New York. By Mary White Ovington, 12mo., pp. 236. New York: Longmans, Green & Co., $1 net. Miss Ovington has made a very careful study of the condition of the colored people in this city, and has presented it truthfully and clearly. The chief impression gained from it is that the title of the book is a correct one, for the negro is not allowed more than half an opportunity in any field of competitive industry. If he has a higher mortality than the whites, and a larger percentage of criminals, it is what might be expected of a class which finds itself shut up to the lowest employments and the poorest financial emolument. In a "foreword" Prof. Franz Boas once more denies, as an anthropologist, the natural inferiority of the race, and the study given by Miss Ovington proves hopeful progress under unhopeful restraint. One might wish the book to find many readers.

....The publication of a new edition (the eighth in five years) of Prof. David Smith's life of Christ entitled *The Days of His Flesh* (Doran; $2) indicates the strong hold the book has taken upon conservative readers. The present edition is improved by corrections and additions. Altho constructed along old lines of work it is deservedly popular because of its frank discussion of critical and historical questions, its background of solid learning, and its attractive style. The extent of the author's work in harmonizing and his readiness to use the critical knife when necessary may be judged from the fact that he finds in the stories of the evangelists a consistent history of the Resurrection only when it "is disencumbered of several bewildering accretions," and this too after a definite statement that

> "in their account of the Resurrection the Synoptic narratives, elsewhere so remarkably accordant, bristle with discrepancies which refuse to be harmonized even by the most violent expedients. It is hardly too much to affirm that, as they stand, they agree only in their unfaltering and triumphant proclamation of the fact that Jesus rose and appeared to His disciples."

....The centenary of Théophile Gautier, which occurred on August 31, has been widely celebrated in the French press. The articles devoted to this poet by the magazine writers are perhaps misleading in that they show him as a great maker of epigrams, whereas epigrams were only a by-product. At least they were not framed for the sake of mere cleverness. Speaking of the famous red waistcoat, worn at the *premier* of "Hernani," "I put it on only once, but I have worn it all my life," he said. It was, as a matter of fact, not a red waistcoat, but a rose-colored doublet; a kind of studio prop—for Théo was a painter as well as a poet and journalist.

....Maxime du Camp tells another anecdote of the author's notions of costume. Gautier refused to serve out his brief period of compulsory militia service. Thereupon he was condemned to spend twenty-four hours in prison. He went to Du Camp for advice, and the latter suggested that he comply with the law. "Never!" exclaimed Gautier.

> "I have no right to destroy the beauty of my limbs by encasing them in a ridiculous uniform. I am sufficiently humiliated in being forced to wear a frock coat like a bailiff without dishonoring myself by putting on a tunic with epaulettes and a shako with a plume. In 1832 I was on the point of embracing the Socialist teachings of Saint-Simon. But when I discovered that I would have to put on white trousers, a red waistcoat and a blue coat, I shrivelled with horror, and renounced the religion of the Father-and-Mother-God. I shall never join a sect that misuses color. I shall serve only in an army which entertains respect for the human form. I'd rather perish in the Bastile than prove false to my principles."

....Two new books discussing phases of country church work mark the growing interest in such problems. Rev. J. O. Ashenhurst, of Pemberville, Ohio, in *The Day of the Country Church* (Funk & Wagnalls, $1) writes of the opportunity, methods of work, and lines where special efforts toward readjustment are necessary in rural Christianity. He emphasizes the need of denominational unity and of co-operation with other social agencies in raising country life standards and solving rural problems. The author's experience in a successful rural pastorate adds weight to his commonsense prescriptions. *The Rural Church and Community Betterment,* issued by the International Committee of the Y. M. C. A. (Associated Press), contains the minutes and addresses of the Rural Church Conference held in New York last

winter under the auspices of the County Work Department. The record of the discussions, participated in by church leaders, theological professors and other interested workers, shows clearly that no settled opinion yet prevails in regard to fundamental issues or plans of procedure. The book is suggestive and well worth reading.

....Lord Alfred Douglas's *City of the Soul* has been out of print since 1900, and a third edition is now issued by the John Lane Co. ($1.50). "These are the poems of extreme and comparative youth," writes their author now; "and the interest they possess would, I believe, be impaired by revisions." The volume was originally brought out anonymously, and contains, amid much chaff, some stanzas of real beauty. Slightly perverse, Lord Alfred's muse excels at rendering Baudelaire into English or telling of that "Garden of Death"—

> "... Whereon the whole year round
> The pale blossoms and the rosebuds be
> In early blooming ..."

whither Death,—

> "Coming like Love, takes all things in the morn
> Of tenderest life, and being a delicate god,
> In his own garden takes each delicate thing
> Unstained, unmellowed, immature, untrod,
> Tremulous betwixt the summer and the spring."

....The history of foreign missions has produced its heroes in service both at home and abroad, and one of the most pleasing ways of gaining an understanding of missionary history and methods is the study of some life in which these are more or less embodied and exemplified. As illustrative of various phases of missionary effort and at the same time full of human interest, the three biographies just published by the Revell Company are to be strongly commended. The actual work of a medical missionary is well portrayed in Mr. Robert E. Speer's life of Dr J. P. Cochran, of Persia, *The Foreign Doctor* ($1.50). The narrative is interspersed with many extracts from home correspondence and reports. For thirty-six years Rev. W. S. Ament labored in China, and saw many changes and crises in the work carried on there. In *William Scott Ament* ($1.50) Dr. Henry D. Porter describes in detail the valuable services of Mr. Ament, giving special attention to the various episodes connected with the Boxer uprising. Among the administrative workers in missions few have accomplished more for the cause than *Rev. Frank Field Ellinwood* ($1), whose life and work are here faithfully and simply set forth by his daughter. The record of his thirty years' connection with the Presbyterian Board and his work on the study of comparative religion, in which he was a pioneer, shows the remarkable advances which have been made in the work to which he devoted his life

## Pebbles

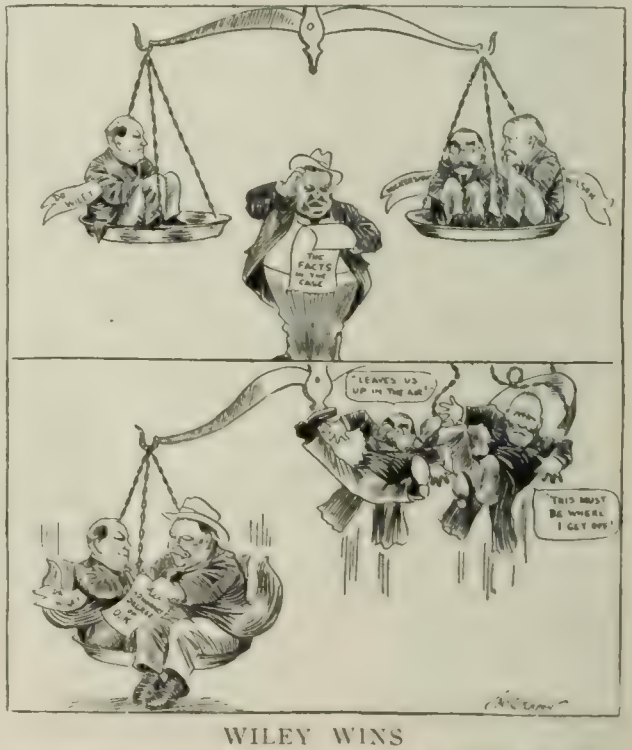
MRS CULCHAW—Did you see any of the old masters while you were abroad?

Mrs. Newrich—Mercy, no! They are all dead.—*Boston Transcript.*

'TIS. 'TISN'T!

(The "Wets.")
Sound the cymbals, beat the drum;
Welcome good old Demon Rum!
Sons of Maine, arise and shout!
Prohibition's going out!

(The "Drys"—later.)
Be rejoiceful, raise a hymn;
We have lopped off Satan's limb!
Tho we gather battle-scarred,
Liquor from our State is barred!



(The "Wets"—still later.)
Fill the tankard, drain the glass;
Guess we "wets" have shown some class,
We're ahead by last reports!
Happy are our glad cohorts!

(The "Drys"—still later yet.)
Brothers, gather in a ring;
Glad thanksgiving let us sing!
Spite of many false alarms,
Prohibition State disarms!

(The "Wets"—on last returns.)
Give a huzza, raise a cheer;
We have won our booze and beer!
We have swung the winning vote!
Prohibition's lost its goat!

("Wets" and "Drys" in chorus.)
Who's ahead we can't agree
Till we hear officially.
Meanwhile we will both sit tight,
Claiming that we've won the fight!

—*New York World.*

WILEY WINS

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Reciprocity Defeated

Reciprocity with Canada has gone down in utter defeat, and carried with it Premier Laurier and the Liberal party, and has made utterly nugatory the action of President Taft in calling the extra session of Congress. Its achievements were the now rejected agreement with Canada and three tariff vetoes. But if the President is disappointed, he had every reason to believe that Canada would accept reciprocity, and even the Conservative party expected it and the gamblers were sure of it. If he made a mistake it was a creditable one.

Why, then, were they all so mistaken? Why has Canada rejected her ablest and wisest leader, after fifteen years of rule, and turned the Government over by an overwhelming majority to his enemies?

There is more than one reason. Jingoism had a great share in the result, or should one say patriotism? The electorate were told that it was the entering wedge for annexation to the United States. If the tariff wall were let down somewhat there would be more trade, and trade would mean more fellowship, and fellowship would denationalize Canada, until the people would tumble over into the outstretched arms of Uncle Sam. They made much of a speech by Speaker Champ Clark, who, in an address, had said:

"I am for it because I hope to see the day when the American flag will float over every square foot of the British-North American possessions clear to the north pole. They are people of our blood. They speak our language. Their institutions are much like ours. They are trained in the difficult art of self-government. My judgment is that if the treaty of 1854 had never been abrogated the chances of a consolidation of these two countries would have been much greater than they are now."

This he said in Congress, before he was Speaker, and a more tactless speech could not be well imagined. Of course, the Canadian opponents of reciprocity made the most of it, as they had the right to, and his explanation, that he said it in a semi-jocular mood, carried no weight. But their use of a speech by President Taft last winter on "the parting of the ways" was a plain perversion of his language, which referred to commercial and not political relations. But the bogey of annexation had very great weight, particularly in Ontario, which is more British than Britain. They would have it that Laurier, who was the leader of colonial independence at the Colonial Conference in London, was now humiliating Canada before the United States. That this country is seeking annexation is nonsense; what Mr. Taft calls "bosh." The time may come—we hope it will—when Canada and this country will wish to unite; but it will not be by annexation. Neither is big enough to annex the other, nor small enough to be annexed. If they ever do unite it will have to be as equals, and under a new constitution agreed upon by the two.

While the Conservative speakers made much of the danger of Reciprocity leading to annexation, and while they succeeded in stirring the national pride to resist the supposed danger, their real reason was other than that which they presented. What they feared was what high tariff men fear here, that their manufacturing profits would be endangered. We might have had reciprocity long ago, but we refused, stupidly, all these past years, for fear that Canadian products would enter into competition with our own. For fear of competition we built

up competing factories in Canada. Now Canada has learned the lesson and has put up her tariff wall, and our trusts, in order to get the Canadian trade, have established factories over the border, and these tariff-fed industries have got to be so strong that they fear American competition if the tariff is reduced or removed. They have put their money into the election. They want the tariff wall, and the higher the better. It is a stupid position, but one that has long held vogue with us, and of late over the border. It is strong just now. President Taft says that if he could have his way he would have no more tariff wall between us and Canada than forts and ships of war, of which there is not one along the border. He is right, and nobly said. Is it any loss to New York and Pennsylvania that they have absolutely free trade across their common border? It is a great advantage to both States, and it would be equally an advantage to Canada and the United States, if both sides only knew it. In the good time coming, when we do not have to spend hundreds of millions every year preparing to kill each other, we shall cut the tariff between the nations to the lowest terms.

There is one other influence that has gone against the Liberal Government of Canada of which very little will be said in the newspapers, and that is the persistent hostility of the Catholic Church to Laurier. Altho himself a French Catholic he has always been a Liberal, and so a rebel against ecclesiastical interference. The Church has had in Canada such a submissive people as has no other country in the world. But Laurier has been one of those who, like O'Connell in Ireland, insist on keeping their politics separate from their religion. Said a Montreal paper a few years ago of certain secret foes of the Church: "They no longer believe in God, but they believe in Laurier." In the early nineties Liberalism, then preparing for its great victory under Wilfrid Laurier, was largely anti-clerical, and was hated and harassed by the Church in consequence. In 1870 the famous "Catholic Program" made a definite alliance with the Conservative party to defend the "impious doctrine" of the separation of Church and State. In 1875 the united Episcopate announced its adherence to this Program. In 1876 Bishop Bourget denounced a candidate who called himself a "moderate Liberal," and called "moderate Liberalism" a "pestilence," and said that "consequently this moderate Liberal cannot be elected a representative by Catholics." The Liberals appealed to Rome and were sustained. But the ecclesiastics remained strongly devoted to the Conservative party; and the Manitoba School Question, in the nineties, showed how they stood. When the people of Manitoba, nearly all Protestants, had abolished separate schools in 1890, the Conservative Government at Ottawa introduced in 1896 a bill to restore the Catholic schools. The case went to the people, and the Liberals, led by Laurier, were successful; but the Church was strongly Conservative. A collective letter of the bishops declared in favor of the Conservative bill, and their position was frankly exprest by one vicar-general: "If any one says to you, 'Despite your arguments, I have more confidence in M. Laurier and I am voting for his candidate,' unless having lost common sense, he will be guilty of a grave and mortal fault;" and Bishop Langevin proclaimed that "a Catholic who does not follow the hierarchy on the school question is no longer a good Catholic." Altho the hierarchy were united they were beaten by Laurier, even in Quebec; but they have never forgiven him. They have taken full advantage of the cry against the United States to join with both Conservatives and the Nationalists, who hate Great Britain, to defeat their old enemy in his old age, and they have succeeded.

Six years ago M. Dominique Monet, for twelve years a member of the Dominion Parliament, made a speech in French to ten thousand French-Canadians of Rhode Island. "Will we always be an English colony?" he asked.

"Certainly not. For in fifty years the population of Canada will be twice as great as that of the majority of the independent states of Europe. Will we be annexed to the United States, or will we take our place among the independent nations of the world? . . . If it is independence which comes instead of annexation, we shall try to exchange with the Washington Government our Western Provinces for

the half-French Canadian States of New England."

That was Canadian nationalism such as Bourassa has talked in Canada.

This election is bad for Canada and bad for the United States. It is a blow to President Taft. But it will be a delight to Joseph Chamberlain. If Canada refuses our open hand she must turn back to Great Britain, cling closer, for a while, to the Mother Country, and perhaps join the federation of the British Dominions in seeking also free trade with all of them. But what then will become of the high protection doctrine now so prevalent among Conservatives? It will be directed chiefly against the United States and will be prolific of trouble.

## Seeking a Soul

THAT a new spirit is now influencing biological research was made very apparent at the Portsmouth meeting of the British Association for the Advancement of Science. Modern science is rapidly recovering from the myopia of the last century. It retains its ability to concentrate its vision upon minutiæ, but it is also willing to raise its eyes and essay a wider vision. The address of Prof. D'Arcy Wentworth Thompson, president of the Section of Zoology, was characteristic of its day in both these respects. It was chiefly devoted to the explanation of cell formation by the laws of surface tension, but it was preluded by a discourse on *Magnalia naturæ*, or the Great Mysteries of Nature, in which he exprest the trend of modern investigation in the following language:

"There never was a time when men thought more deeply or labored with more zeal over the fundamental phenomena of living things; never a time when they reflected in a broader spirit over such questions as purposive adaptation, the harmonious working of the fabric of the body in relation to environment, and the interplay of all the creatures that people the earth; over the problems of heredity and variation; over the mysteries of sex, and the phenomena of generation and reproduction, by which phenomena, . . . we gain our glimpse of insight into eternity and immortality. These, then, together with the problem of the Origin of Species, are indeed *Magnalia naturæ*, and I take it that inquiry into these, deep and wide research specially directed to the solution of these, is characteristic of the spirit of our time, and is the password of the younger generation of biologists."

He showed how the great German biologist, Driesch, beginning his work with the creed of a mechanist, found it impossible to explain the phenomena of life by chemical and physical laws alone, and was forced to admit the presence of a peculiar vital principle which controls the development of the organism. He showed how the French philosopher, Bergson, had discussed the whole meaning, bearing and philosophy of evolution "on a plane to which neither Darwin nor Spencer ever attained." And he concludes with an eloquent and modest paragraph, very different from the cocksure prognostications in vogue not long ago:

"In Wonderment, says Aristotle, does philosophy begin, and more than once he rings the changes on the theme. Now, as in the beginning, wonderment and admiration are the portion of the biologist, as of all those who contemplate the heavens and the earth, the sea, and all that in them is. And if Wonderment springs, as again Aristotle tells us, from ignorance of the causes of things, it does not cease when we have traced and discovered the proximate causes, the physical causes, the Efficient Causes of our phenomena. For beyond and remote from physical causation lies the End, the Final Cause of the philosopher, the reason Why, in the which are hidden the problems of organic harmony and autonomy and the mysteries of apparent purpose, adaptation, fitness, and design. Here, in the region of teleology, the plain rationalism that guided us thru the physical facts and causes begins to disappoint us, and Intuition, which is of close kin to Faith, begins to make herself felt."

In the Section of Physiology Prof. J. S. MacDonald spoke in a similar vein on "The Eye, Ear and Mind." When he said "the eye is as perfect an optical instrument as could be made with a full knowledge of the part played by matter and special arrangements of matter in reflecting refracting and absorbing light," we are reminded that it was not many years ago that one of the leading physicists of the world said that if his optician had sent him an instrument with as many defects in it as the human eye, he would have refused to accept on the ground of poor workmanship.

Professor MacDonald argues that either external agency cognizant of light or light itself has formed and developed to such a state of perfection this purely optical mechanism, and that natural selection can have done no more than assist in this process. Since the eye de-

eclipse in the embryo in the absence of light, he suggests that other forces, perhaps electrical, are then at work constructing this complicated lens and camera and fitting it to receive the light which is to come to it later at birth. The same reasoning might apply to the development of the ear, and even of the mind, but on this point his conclusion is so important and his language is so obscure, perhaps needlessly and purposely obscure, that it is safer for us to quote than to paraphrase it:

"In man mind is associated with the brain. There is also the point that even in the case of the brain such phenomena as sleep and deep anæsthesia familiarize us with the fact that the mind is not necessarily always associated with the brain, but only with this when in a certain condition. Now, there is no scientific evidence to support or to rebut the statement that the brain is possibly affected by influences other than those which reach it by the definite paths proceeding from the sense-organs and from the different receptive surfaces of the body. It is still possible that the brain is an instrument traversed freely as the ear by sound, by an unknown influence which finds resonance within it. Possibly, indeed, the mind is a complex of such resonances; music for which the brain is no more than the instrument, individual because the music of a single harp, rational because of the orderly structure of the harp. Consider such a possibility, and the analogy which I have prepared in dealing with the eyeball is seen to have some meaning, inasmuch as an instrument shaped in the embryo by a certain set of conditions might in due course of time become the play of some new influence which had taken no immediate part in fashioning it. I will not dwell upon the point behind this statement except to say that I find it difficult to refrain from using the word 'soul.'

"I put forward this expression of belief rather than opinion, and not as based on evidence or in any way a statement of demonstrated or demonstrable fact. The essential point for the moment is this—that there is some loophole for the view that mind is not directly associated with life or living matter, but only indirectly with certain dispositions of dynamic state that are sometimes present within certain parts of it. It is a point of view not without interest to physiology, since it will leave that science free to consider all phenomena present in such forms of life and living matter as carry no suggestion of an association with mind, as nothing more or less than physico-chemical phenomena, which, when thoroly investigated, will be completely translatable into scientific terms."

We have no space to discuss these interesting views as we should like. We can only call attention to them as significant of the tendency of the times. Formerly it was customary to assume that all vital phenomena could be completely explained by the motion of the molecules. The nineteenth century was memorable for the successful raids into the field of biology by the chemists and physicists, who indeed confidently predicted their ability to annex the whole of it in time. The campaign is still to be continued on the same line. Doubtless still greater victories will be won under the banner of the mechanistic hypothesis. But it is beginning to be perceived that another point of view is also possible, equally legitimate and in some respects more valuable. The fact that the shape of the marks formed by ink flowing from a pen upon paper can be completely accounted for by the laws of surface tension and adsorption, does not preclude the possibility of reading them as words. Biologists are becoming more and more disposed to believe that living matter is not to be interpreted by the lifeless, but by life.

## The Menace of Barbarism

"THE next twenty-five years will determine whether the United States shall go on as a republic or become a monarchy." This remark was made a few days ago by a distinguished American scholar who, for forty years or more, has enjoyed an international reputation as an exceptionally sober-minded and conservative writer on public questions.

Looking back twenty-five years, he explained, one is compelled to admit that American civilization has been disintegrating. The economic struggle between the powerful rich and the wage-earning classes has extended and become acute. The powerful rich have not shown an interest in intellectual things commensurate with their opportunities, altho individuals have made large bequests to institutions of learning. Even art they have not appreciated, and the picture dealers will tell you, as the book publishers have been telling us, that the automobile and the purely material pleasures that go with it have nearly ruined their business. The wage-earning masses, whether because their lives have been too poor and barren to permit them to care for such things, or for whatever other

reason that may be alleged, are not interested in the advancement of knowledge or the creation of beauty. Whether it be due to their nature or to their circumstances, they care little for learning, or for cultivation in any true sense of the word. The pleasures of rich and poor alike have long been vulgar, and are now becoming unmistakably brutal. Only the small class professionally engaged in intellectual pursuits has been doing anything to save our civilization, and this class is now being crushed between the upper and the nether millstone of our economic system.

Lawlessness in every form has been increasing. Corporations have set the example of preying upon the public domain, the stockholder, the taxpayer and the wage-earner. Mobs burn negroes in the North, as in the South. We have the reputation of being a country in which murder goes unpunished. The kidnaping of children has become a commonplace crime; the wrecking of shops and tenement houses by bomb throwers an almost weekly occurrence. Hoodlumism in the streets and in public conveyances has made our everyday going and coming an experience to be dreaded.

Democracy shows neither the disposition nor the ability to grapple with these evils. On the contrary, it is year by year making government more inefficient, by multiplying elective officers and continually shifting administrative officers, so that no official, however sincere his desire to serve the public, can become a true expert in his business or feel that his efforts will be appreciated and backed up by the voters. There is no reason to expect, therefore, that life and property will, under these circumstances, become more secure. Labor disturbances will more and more interfere with the regular course of business. In the end the thing will happen that invariably has happened at this stage in the evolution of a people, since civilization began. The classes that care for civilization, and are not ready to see it overwhelmed by barbarism or destroyed by social chaos, will rally around a strong man, a military figure, and will set up a monarchic government.

This, in substance, was the social diagnosis and the prediction made, not in any public utterance for sensational or for political effect, but quietly and, by the way, in a conversation among friends, as a matter-of-fact expression of personal conviction.

The prediction is one that we are not prepared to indorse, but the account of American life, upon which it is based, unfortunately is substantially true. No competent observer can impeach it in any important particular. The American social system has been disintegrated. A wave of barbarism has swept over the country. Overshadowing every other issue is the imperative necessity to rally the intellectual and moral forces of the nation, not merely to achieve this or that reform, but to preserve the essentials of civilization.

Nevertheless, our faith that they will be preserved is as yet unshaken. It rests upon the fact that everywhere the people are beginning to see the danger and to be alarmed over it. It is absurd to suppose that we lack the resources, the strength of character, or the intelligence to deal with the situation. The chief element of danger has been indifference. It is the duty of every good citizen, as of every public teacher, to put aside that fatal pride and spirit of conceit which has made Americans a nation of silly braggarts, and, quietly facing the ugly facts, to set resolutely about the big task of transforming them. Democracy must show that it is capable of creating an efficient government in nation, State and municipality, of remorselessly suppressing lawlessness, and of diligently contributing to the advancement of learning and the maintenance of justice and equal opportunity for all, as well as of money-making.

## The Trust Question

PUBLIC interest in the Trust problem was stimulated last week by several events and rumors. The President, speaking at Detroit, commended the Supreme Court's decision and opinion in the Standard Oil and Tobacco Trust cases, vigorously opposed any amendment of the Sherman act, warned business men that they must square themselves with the law, and predicted that there would be a voluntary breaking up

of all combinations in restraint of trade. He asserted that the court is "making those two great combinations divide themselves into actually competing parts." It became known that the International Harvester Company, or Farm Implement Trust, had sought the Attorney-General's advice as to the manner in which it might satisfy the law, and that prosecution of it had been deferred in order that it might voluntarily dissolve. Two indicted combinations will probably avoid punishment by a similar surrender. There was some evidence of a general movement of this kind on the part of combinations which have reason to expect prosecution. Indictments were found against the Shoe Machinery Company and a combination of dealers in kindling wood.

It was reported that the Department of Justice had made due preparation for proceeding in the courts against the great Steel Corporation, that the Corporation was striving to avoid prosecution by planning a satisfactory disintegration, and also that it had determined to defend itself, making no concession. These reports caused great disturbance on the Stock Exchange, where large sales of Steel shares were accompanied by heavy losses in the price. Other industrial securities were depressed, owing to the President's speech and to published interviews with Attorney-General Wickersham which appeared to foreshadow numerous prosecutions.

Mr. Taft said that the Sherman act had not been emasculated or weakened by the Supreme Court's use of the "rule of reason." That is true. We believe that the court's memorable opinion has made the statute more effective for the punishment or prevention of that Trust injustice and oppression at which it was aimed. It should be remembered that application of the "rule of reason" not only did not prevent condemnation of the great Standard Oil and Tobacco combinations by unanimous vote, but also enabled the court of last resort to include in its judgment many persons and three subsidiary corporations which the lower court—"construing the act by the narrow rule of the letter which kills"—had permitted to escape. The amendments which have been proposed would compel enforcement of the statute in accordance with that narrow rule that kind of enforcement which, as Mr. Roosevelt said, "would destroy the business of the country." These amendments should be rejected.

But it does not follow that the Sherman Anti-Trust law, even when interpreted with the aid of the "rule of reason," is an ideal statute and the best possible instrument for preventing that injustice toward competitors and the public of which certain convicted combinations and others not yet prosecuted have been guilty. The compulsory disintegration of a great manufacturing combination will not necessarily be beneficial to the public and the nation. The evil and the wrong associated with an offending great combination have not been found in its size, but in its practices. In many instances the association of several similar concerns under one management has permitted economies of production and prevention of waste. In the resulting large organization there can be a profitable concentration of each branch of the industry, a better arrangement of the several departments.

Mr. Taft is confident that the two combinations of which he was speaking will be "divided into actually competing parts"; in other words, that there will be, for example, thirty-three Standard Oil companies actively competing among themselves with respect to prices and for markets. We must say that in the case of that great consolidation such competition can scarcely be expected, altho, of course, the court will insist upon something that looks like it. We are not sure that actual competition, in a case of this kind, is to be desired in the interest of the public, provided that the advantages of consolidation can be had without the disadvantage of accompanying injustice and greedy exaction. If the Steel Corporation should be dissolved, if the companies which were taken into it should be placed as they were before and be made independent of each other, and if they should compete actively among themselves, would the public and the nation gain by the change? We are inclined to think something would be lost.

We know what the sins of many combinations have been. Competitors have

been cruelly oppressed and wronged and consumers have suffered by reason of unjust exactions. We are familiar with the history of trust offenses, and give due weight to all that can be said in denunciation of them. It will be pointed out, also, that those who have made and controlled combinations have not, as a rule, given to the public, or shared with the public, the benefits due to the economies of association, but have retained them for their own enrichment, being enabled to do this by various devices, among which overcapitalization may be mentioned.

But is it not possible by official supervision and regulation to gain for the people and the country the advantages of consolidation and concentration, and at the same time prevent the wrongs as to which complaint is so justly made? This is an important question, and an answer to it should be sought before we insist upon the disintegration of substantially all of our great industrial combinations and upon the actual and active competition of the separated parts. The subject is one that might reasonably and profitably be submitted to a carefully selected commission, which should inquire not only concerning conditions here, but also as to the policies of other nations which are dealing with the same problem.

## Questions of Dishonor

We have been told over and over again, and lately by ex-President Roosevelt, that there are questions of honor that cannot be settled by arbitration, and he has given us a list of such questions. It would seem to us that just such questions could best be settled by a court of honor; but there are questions that cannot possibly be settled by arbitration, and they are questions of dishonor, questions of bare grab, those that arise under the law of the strongest, where might makes right.

For example, it has occurred to no one to suggest arbitration over the question of difference between France and Germany over Morocco. This is a case of grab; France wants Morocco, or a piece of it, and Germany wants a finger somewhere in the pie. Of course, France has some sort of a pretext, and so Germany has invented one; but the pretext deceives nobody, and it were better to drop the veil of hypocrisy and simply confess the grab. France wants to extend her Mediterranean line past Tunis and Algeria to the Atlantic, if Spain will allow it, and Germany wants "compensation," that is, a share somewhere in the division of spoils. That Morocco is an independent nation makes no difference. She is weak and has no rights, scarcely more rights than the natives of Central Africa. It is a case of grab, and grab cannot be arbitrated, for it is a question of dishonor.

Another case has just come up, that between Italy and Turkey. Seeing that France and Spain are likely to get possession of Morocco, as France had taken Algeria and Tunis, and as Great Britain had taken Egypt, Italy thinks the occasion ripe to grab Tripoli. To be sure, Italy has no real rights in Tripoli, but it is just across the Mediterranean, and she wants it. To get it will repair her disgrace at the loss of so much of her East African claims by the war with Abyssinia. It is true that France had told Italy, and so have other powers, that they would not interfere when Italy's time comes to grab, but Tripoli belongs to the Turkish Empire, is governed reasonably well, and there is no real right possessed by Italy beyond that by which his pals support any robber. It has been made clear for some time that it is "compensation" that Italy asks, a euphemistic term for a share of spoils. Some complaints against Tripoli have been just now put forward, but that is a transparent after-thought. Her right is only her supposed power, and the weakness of Turkey. It is a question of dishonor such as no one would think of arbitrating.

But now Turkey threatens war, and she will not first go to The Hague. Italy will do well to look out. She should remember the crushing defeat at Adowa in 1896, when she lost all but a little strip of the African littoral. Then she had only Abyssinia to fight, and Turkey is a very different opponent. She has 30,000 soldiers in Tripoli. The Turks can fight, and war does not cost them much. Mohammedanism makes reckless soldiers. If the Italian Social-

to object to the war they will be doing an honest act. But Turkey is supposed to be weak because she has no navy, and we have been told by Mahan that wars will be decided by navies. Italy could bombard the Turkish ports, but would have trouble to reach the inland, while Turkey would have difficulty to send more troops to Tripoli. Beyond doubt, Italy could finally take Tripoli if Turkey made no trouble elsewhere; and we do not see how, with no fleet, she could disturb the Italian coasts. Her fighting army Italy need not meddle with. So Italy can, with some severe fighting with what forces Turkey has in Tripoli, take it, no war declared, and no arbitration possible. Highwaymen never palaver.

If the United States were of this sort we could easily get into this division of spoils. Did not the United States bombard and invade Tripoli in the years from 1803 to 1815 and enforce our right to be considered? But we have no such ambitions. When Italy takes Tripoli, however, to compensate her for what she had not lost, when France and Spain take Morocco, and Germany gets her slice elsewhere in Africa, just as Austria has of late taken Bosnia, we may expect Russia to demand of Turkey her slice of Asia Minor; and what will become of Crete and Macedonia? Greece and Bulgaria think they know; and the rest of European Turkey will find claimants enough. Whatever war takes place or is threatened, the Carnegie Palace of Peace at The Hague will be left to the spiders, for questions of dishonor cannot be arbitrated.

### Not Christian Ethics

We find the following extraordinary statement in *The American Israelite*, one of the most accepted Jewish journals of the country. After exulting over the fact that the assassin of Stolypin was a Jew, it says:

"The shooting is, as is natural, laid at the doors of the Jews, and we hope properly so. If the Jews of Russia did not have the manhood ground out of them by continued oppression and suppression they would by fair means or foul kill the leaders of their oppressors or as many as they could reach until human rights were granted to them. This may seem extraordinary advice for a religious paper to give, but the *American* rather than the *Israelite* side of its dual character is predominant today."

It would not be impossible to support this advice as "Israelite," also by an appeal to the Jewish Scriptures:

"The righteous shall rejoice when he seeth the vengeance. He shall wash his feet in the blood of the wicked."

"Let their table before them become a snare, and when they are in peace, a trap."

Let his children be fatherless, and his wife a widow.

"He loved cursing, and it came unto him; He delighted not in blessing, and it was far from him."

And our Israelite contemporary can find support in what Joshua did to the cities of Jericho, Ai, Makkedah, Libnah, Lachish, Gezer, Eglon, Hebron, Debir, and Hazor, where he destroyed all the inhabitants, enemies of Israel, men, women and children, and "left not one living that breathed." We recommend *The American Israelite's* utterance to the encouragement of the anarchist wing of the labor unionists who are killing their enemies with bombs, practising and defending wholesale assassination. We wonder if it will like its company.

### Official Church Organs

Some pretty plain talk is now being used in resenting the assumption that none but "official" journals, owned or endorsed by the bishops, are true Catholic papers. At the late meeting of the Catholic Press Association the Rev. D. J. Toomey, editor of the Boston *Pilot*, formerly edited by J. Boyle O'Reilly and then by J. J. Roche, and now owned by Archbishop O'Connell, in the language of *The Catholic Fortnightly Review*, "went out of its way to cast slurs on the entire Catholic press of the country, so far as it does not consist of 'official' organs." He insisted that there is no real Catholic press except as owned or endorsed by the bishops. Thereupon another editor of the non-official sort shows that such a claim rules out all the leading Catholic journals of the world and asks, "Shall the Catholic press be 'Toomeyized' in favor of a baker's dozen of 'official' organs whose chief occupation seems to be to glorify their owners?" He concludes:

"Gauged by Rev. Toomey's criterion, Louis Veuillot, Joseph von Görres, Herbert Vaughan, J. P. Tardivel, Orestes A. Brownson, James A. McMaster, and the other great Catholic editors whom we have been taught to revere, were not Catholic editors at all, but mere pretenders, usurpers of an authority

which did not belong to them. The real Catholic editors of the past were the nameless and inglorious Toomeys (if there were any) who scrupulously refrained from 'criticising authority' and servilely sang the praises of their respective lords, whether great or small, worthy or unworthy.

"We are afraid the real Catholic editors of the land—the Griffins, the Campbells, the Preusses, the O'Briens, the Yorkes, the Harts, the O'Haras, the Pallens the Gonners, the Kenkels, the Matts, etc., etc., will refuse to be Toomeyized."

This represents the independent, intelligent laymen's view of ecclesiastical authority. They are willing to be faithful to the Church, but not to be timid toadies. The line between the two classes is a very marked one.

**Doings in Liberia**

We are not sure but things go as well in Liberia as they do in some of the smaller southern republics, or in some parts of the United States; but that is not saying much. In the city of Buchanan, Grand Bassa, Liberia, they had a big celebration of Independence Day, July 26, and after an oration by Mr. Reeves and a procession they sat down to a fine dinner. All went well until Mayor Johnson, of Edina, a guest, who had the seat of honor at one end of the table, slapped a soldier, who retaliated by smashing the Mayor between the eyes. The soldier was taken away, but returned a little later, thinking the fracas was forgotten; but Mayor Johnson seized a bottle of beer and smashed the soldier's face. This broke up the dinner. Mayor Johnson, who began the difficulty, is pardoned, because he was in the habit of getting drunk; for, says the account, "many excuse the honored guest from Edina, for always when he is thus influenced he is liable to act in a way that he would not under different circumstances." The Mayor of Buchanan, Mr. Innis, had a scrap of his own the day before over a pig. He had tried to buy a pig of Mr. Marshall but the latter would not sell. The Mayor bought Mr. Marshall's pig from another man "in good faith," and then shot it, which is perhaps the Liberian way of butchering, as it was the Indian in the days of distributing rations on the hoof. Mr. Marshall did not believe that it was bought in good faith, and words got so high that he got his gun and tried to shoot the Mayor, but was prevented. We are interested in Mr. Reeves's Independence Day oration, and we favor our readers with the passage on female suffrage:

"Every woman's wisdom exceeding its limits, so as to cause her to cry for the right of suffrage, is abusing the cause of liberty, separating the union, and had better be dammed lest the contagion be spread. She is as a weathercock shorn of his glory, a church without a dome, a clock without a pendulum, an empty cask."

**Grammar-Mad**

If English schools can get along without Latin one would not think the French could, as their language is based on Latin; and yet at the University of Montpellier there is a professor of linguistics and comparative grammar, M. Grammont, who has lately written as follows to a scholar who wishes to urge a more correct pronunciation of Latin:

"I do not at all agree with your admiration for the Latin language and literature. The language, from the Indo-European point of view, is no more than a jargon, particularly the classic speech. The qualities of harmony, the beauties which you attribute to it are imaginary. Its classical literature is but of third rate quality."

With a fine disdain M. Grammont proceeds to take the measure of the chief Latin authors. Cicero, he says, "was an advocate, shifty in making sounding phrases, and greedy for gain, while Virgil's 'Æneid' is but Voltaire's 'Henriade' without his facility"; and as for Horace, he was "a Boileau lacking his taste." This shows what devotion to grammar may make of a man.

The announcement made by newspaper correspondents who have seen the exposed wreck of the "Maine," tho not yet confirmed officially, will be a surprise to many people. We had quite prepared ourselves to learn that it was destroyed by some accidental explosion in its own magazine, and that "Remember the 'Maine'" was a baseless madness. But if, as distinctly declared, the lower hull of the vessel is broken in two and the parts lifted up from below, not thrust down, there can be no doubt that the vessel was destroyed by a monster mine. How it could have been put there unseen will be the problem. If it was done by

Spaniards their act was one of the most short-sighted folly. It cost them all their colonies.

We observe that the superintendent of the New York Civic League, expects defeat in the legislature in the eviscera-tion of the race-track gambling law enacted under Governor Hughes's administration; and he believes that the gamblers will get their majority by bribery. It is perfectly certain that the people, to whom Governor Hughes appealed, approve the present law, and so Mr. O. R. Miller, superintendent of the Civic League, says with a good show of reason:

> This is only another argument why the people of this State must have a direct primary law which will make it easy for the people to nominate good men for office and hard for the bosses to nominate bad men for office. We must dethrone the bosses and enthrone the people.

Read this from *La Follette's:*

> "'Thank God!' exclaimed President Taft, fervently, 'we had John Marshall and his associates to decide that the courts are the ultimate tribunal to make the laws that the legislature enacts square with the Constitution!' Read again that phrase, 'ultimate tribunal to make the laws,' putting emphasis on the last three words."

A more shamefully misleading comment could hardly be made. President Taft did not call the Supreme Court the "ultimate tribunal to make the laws," but "to make the laws which the legislature enacts *square with the Constitution.*" Put the emphasis where it belongs and you will not garble the language nor reverse the sense.

Several months ago a private in the army, who had the ambition to study and take an examination for promotion as second lieutenant, was refused by the colonel a commission on the ground that he was a Jew. President Taft ordered the colonel reprimanded and the soldier given another examination. Now he has passed it and will doubtless be commissioned. The army officers learn that it is not safe to say disparaging things about Jews; they can discriminate only against negroes.

The news of the discovery of a manuscript commentary on more than half of the Book of Revelation, believed by Professor Harnack to be by Origen, is of no little importance to scholars of patristic literature and also to those devoted to textual criticism and exegesis. Origen was the greatest scholar among the Greek Church Fathers, and one of the earliest. His judgment about this disputed Book of the Revelation, which was not admitted into the early Syriac Peshitto translation, will be of value.

In vocational schools there will be found less desire on the part of the pupils to slight their work than in classes whose members do not so clearly see the profit of their studies. It is not then so extraordinary that over sixty scholars in the senior class of the Wilkesbarre, Pa., high school have struck because the teachers would not give them work enough to do. What they demanded was more typewriting practise.

It is sad to learn that this year at Naples the blood of St. Januarius has refused to liquefy, notwithstanding processions and prayers, and the pious devotees of the saint believe it foretells some fearful calamity. Perhaps it has a better omen, that of the passing of superstition and fraud.

Cremation, disapproved in the Roman Church, is finding its friends in the Anglican. The English Church authorities were lately trying to concoct a funeral service in which dust should give way to fire. The first deposit of real ashes in Westminster Abbey has just been made, that of Canon Duckworth.

One of the great and useful men of the world was Sir Robert Hart, who died last week, at the age of seventy-six. He controlled the Chinese customs, and so the finances of the Empire, and was a good friend of China, and did much to aid her advance to membership in the sisterhood of nations.

It is regrettable that the cholera in Rome will prevent the Interparliamentary Union from meeting this year. Its sessions are an aid to the cause of international peace.

# Insurance

## The Current Fire Loss

THE month of August showed the first normal fire loss for the disastrous year 1911. Already the total loss is $20,000,000 in excess of the same period of 1910, and indications point to the final figures for the year approaching the enormous sum of $300,000,000. In addition to the heavy fire losses, the stocks and bonds held by the fire insurance companies have suffered a heavy market depreciation. This year may well be considered a test of the stability of any fire insurance company. Undoubtedly many of the smaller companies will find themselves financially embarrassed and even forced to re-insure, but the strong companies that safely weather the unfavorable times will find themselves in a more desirable situation than before. An increase of business will result and, provided the necessity of liquidating stock holdings does not arise, the increased market value of their assets will make a favorable financial statement. While temporarily the fire insurance companies may find the situation unsatisfactory, they can reasonably expect to transact business with a profit, and the awakening of the public to a realization of the injurious effect of national fire waste upon our general prosperity makes the future look brighter.

A VERY poor risk for an accident insurance company to accept would be Aaron Walker, of Newport, N. H., whose unfortunate history is told by the Travelers' Insurance Company of Hartford. From his infancy until his sixtieth birthday he has been the victim of every sort of accident. When he was eighteen months old boiling tea scalded him severely. At the age of two he fell on a hot stove and was badly burned. At eight he coasted into a stone wall and fractured his skull. At eleven a hay fork was stuck thru his leg. At fourteen a scythe went thru his arm. When twenty he broke three ribs, and when twenty-one broke both his legs and an arm. The next year a buzz saw got him, then he fell from a horse and injured his spine. He fell off a roof at twenty-four and broke nearly every bone in one side of his body. At thirty, when cutting lumber, he drove an axe into his left foot, and two years later fell from a load of hay and fractured his hip. The following year a man with whom he was digging in a clay pit drove a pickaxe into his head; then a freight train broke his leg at the hip. Next a stone lifting apparatus collapsed and crushed him, a mowing machine cut his legs badly, and a fall from a hay loft caused him to buy a pair of crutches. On his sixtieth birthday he put a penny in a weighing machine and the front of the machine fell out and fractured his nose. There were other times that he was hurt when he did not have to call the doctor, but he does not count them.

LAST year the Continental Casualty Company of Chicago paid 14,162 claims, aggregating $258,710, under its health insurance policies. The classification of the ailments is of interest:

| | Number. | Amount. |
|---|---|---|
| Influenza | 2,548 | $37,191 |
| Malarial fever | 1,953 | 28,833 |
| Rheumatism | 845 | 15,063 |
| Bronchitis | 608 | 9,855 |
| Tonsilitis | 514 | 5,913 |
| Pneumonia | 411 | 11,368 |
| Typhoid fever | 355 | 18,204 |
| Boils | 318 | 5,160 |
| Lumbago | 310 | 4,156 |
| Gastritis | 309 | 5,500 |
| Appendicitis | 294 | 11,807 |
| Indigestion | 293 | 3,483 |
| Pleurisy | 291 | 5,900 |

THE New York Life Insurance Company will pay $2,000 to Mrs. Ida Pike, of Cripple Creek, Col., the amount due on a policy carried by her husband. The curious feature of the case is that the New York Life received not a cent in money for the policy. The insured gave three notes, payable in thirty, sixty and ninety days, respectively, and the policy was issued from the New York office. The Denver agency sent the policy to a bank to be delivered when he paid his first note. The insured died before the note became due.

# Financial

## Railroad Earnings

Figures compiled by the *Journal of Commerce* show that the gross earnings of twenty-one prominent railroad companies in the fiscal year which ended with June last were greater by $58,808,952 than those of the year immediately preceding, while the net earnings were less by $14,495,082. A slight increase of business has been accompanied by a considerable increase of operating expenses, due mainly to higher wages. An investigation made by the Bureau of Railway Economics, with respect to ten representative railroad systems, gives the basis for an estimate that the wage payments of 1912 will exceed those of 1911 by 4⅞ per cent. In the St. Paul Company's recent report, President Earling ascribed the decrease of 10 per cent. in net earnings to "great increase in the cost of labor and inability to obtain increased rates." President Mellen explains in the same way an increase of nearly $4,000,000 in the operating expenses of the Boston & Maine.

## The Stock Market

On the Stock Exchange, last week, there were large transactions, with a falling market. Shares of the Steel Corporation were noticeably weak, the net loss being 11⅞ for the common stock and 9 for the preferred. About 2,000,000 shares of the common were sold, 717,000 on Friday, and the lowest price showed a decline of 29 points from the highest figures of the year. Other large declines were 9 points for American Smelting, 8½ for Amalgamated Copper, 4¾ for General Electric, 5 for National Lead, 4⅜ for Rubber, and 3½ for International Harvester. Thursday's total, 1,258,000 shares, broke the record for this year, and Friday's, 1,393,600, was the largest for a year and a half. To domestic influences of a depressing character was added the sentimental effect of an advance of bank rates at London, Berlin, Paris, Vienna and Brussels.

Steel shares were affected by reports that the Corporation was to be prosecuted by the Government, that plans for the dissolution of it had been prepared, and that a reduction of wages in the steel industry was at hand. Powerful "bear" speculators made use of these rumors and were assisted by the announcement that the International Harvester Company would dissolve. It does not appear that any plan for the disintegration of the Steel Corporation has been considered, or that a decision as to wages has been made. Business in the steel industry is by no means active, and the average of prices is as low as it has been at any time since the Corporation was formed. If there should be no improvement, a reduction of labor cost may be discussed. Two small concerns made a reduction last week. The entire list of securities, and especially the industrial stocks, have been affected to some extent by a conviction that a considerable reduction of tariff duties will soon be made.

....In the nine distinctive cotton States 698,957,000 bushels of corn were produced last year.

....Official inspectors recently reported that this year's wheat crop in the Canadian Provinces of Manitoba, Saskatchewan and Alberta is 178,650,000 bushels, to which may be added 223,500,000 bushels of oats and 33,000,000 bushels of rye.

....After three years spent in the construction of a great dam and buildings, what are said to be the largest pulp and paper mills in the world are now in operation on the banks of the Powell River, in British Columbia, 90 miles north of Vancouver. The sum invested is about $10,000,000.

....According to a recent report of the Census Bureau, there were in the United States last year 6,340,357 farms, and the value of lands and buildings was $34,681,507,000. In ten years the value of the land had increased from $13,058,008,000 to $28,386,770,000, the value of the buildings from $3,556,640,000 to $6,294,737,000, and the average value of the land per acre from $15.57 to $32.49.

## Survey of the World

**The President on Tour**

The President has now visited several "insurgent" States. At Marquette, Mich., ten days ago, he was introduced by Congressman Young, of that district, who made an attack upon "the spurious progressiveness of shifty politicians at which cynics smile and angels weep." This attack was recalled last week when, at Hutchinson, Kan., Walter I. Fisher, the new Secretary of the Interior, began a speech by saying: "I am one of those who count themselves in the rank of the progressives" (a statement that elicited loud cheering), but continued:

"I believe in true progress. I do not believe in the hypocritical, demagogical progressives who declare for progressiveness and then oppose every practical progressive policy put forth. I believe in progressiveness that means what it says. When the President of the United States told an audience some time ago that he was trying to keep to the middle of the road I believe that he meant what he said and I think you believe he meant it. You must judge a man by what he does and not by what he says."

—In Leaving the State of Kansas, the President thanked the citizens "not only for the warm welcome extended . . . but for the kindly attention which they gave to what I said." Senator Curtis, of Kansas, gave out this statement:

I am convinced that a large majority of the people of Kansas, and of the country as well, favor the arbitration treaties. I hope and expect to see them ratified, with only such changes as will in no way affect their character or efficiency."

The President had great crowds at his Kansas meetings, tho insurgent newspapers state that these audiences were "polite" rather than enthusiastic. Senator Cummins expresses approval of the plan for holding a Presidential primary in Iowa next spring. "The plan is a good one to settle the controversy in Iowa," he says. The President's reception at Des Moines, where he was greeted by Senator Cummins, was non-partisan in character. The President proceeded from Iowa into Nebraska.——On several occasions Mr. Taft has spoken on the relations of the Government to business. At Detroit, two weeks ago, he challenged his critics to prove the soundness and sincerity of their attacks, especially the critics of the recent trust decisions of the Supreme Court, notably Mr. Bryan. Speaking at St. Louis, September 28, before a large audience, he replied to Mr. Underwood's attacks upon the Tariff Board. Next day, at Waterloo, Iowa, he discussed "The Relation of Government to the Business of the Country." (See our editorial in this issue: "Trust Law Uncertainty.")——Former Governor W. L. Douglas of Massachusetts (Dem.) states in an interview that Champ Clark is the likeliest nominee of his party for the Presidency. He continues:

"Taft has only one possible chance for re-election. He must stop toadying to the insurgents. . . . Unless business confidence is restored, and that quickly, there will be a worse state of panic than we have had since 1900. The general business of the country has fallen off 25 per cent. since that year.

"Taft with his talk and Wickersham with his threats of probes are precipitating another panic. . . . The Sherman law should be amended so that it can be more clearly understood and more properly applied. The big corporation has come to stay. Modern business conditions demand it. It ought to have the right to buy out other corporations, not for the sake of shutting down plants but to include them in their scheme and operate them profitably.

"Taft is alienating the business interests. He cannot hope to get the insurgent. There

is only one thing that can save him and that is the conservative vote of the country. . . . We must have new parties if the business of the country is to be saved and conserved. A new alignment is coming. Today there is no Republican and no Democratic party, strictly speaking. The insurgent Republicans are nothing more or less than radical Democrats. They are of the same beliefs and theories. They will come together in a new party, the radicals, in a few years.

"And the other party, the conservatives, will be composed of the business men and the workingmen who want less political excitement and steadier employment."

*

**The Primaries**

Last week was one of primary elections. In Philadelphia, the Penrose candidate, George H. Earle, Jr., banker, was chosen by a 23,000 majority of the Republicans over William S. Vare, Mayor Reyburn's candidate, to succeed Mr. Reyburn as chief executive; while the Keystone-Democratic candidate, Rudolph Blankenburg, was chosen by 37,000 over D. Clarence Gibbonev. The Earle-Blankenburg contest will be an interesting one, following as it does Philadelphia's first genuine primary campaign.——In New Jersey the primaries were held under the new Geran law. Governor Wilson was disappointed by the defeat of Wilson League candidates for the Assembly in Essex County. In Jersey City the Democratic incumbent, H. Otto Wittpenn, won renomination over the regular Democratic organization. For the first time in the history of the State the Governor will make a campaign tour in the interests of legislative and local candidates. Governor Wilson expresses satisfaction at the primary results except in Essex.——In Massachusetts the Republican machine won by a vote of three to one, nominating Lieutenant-Governor Frothingham for Governor. The Democrats renominated Governor Foss.——In San Francisco, Mayor McCarthy, a labor agitator, was defeated for renomination by about 27,000 majority. James Rolph, Jr., the successful candidate, will be elected without contest.——By an overwhelming vote, Atlanta, Ga., voted down the charter providing commission government.——Thirty more judges and clerks, making thirty-six in all, of the election officers of the recent primaries in Baltimore, have been indicted on the charge of fraud.

*

**Various Items**

The concrete storage dam of the Bayless Pulp and Paper Company, half a mile above the town of Austin, in north central Pennsylvania, collapsed in eight places on the afternoon of September 30. The towns of Austin and Costello, Pa., were destroyed in consequence, and over 100 lives were lost. More than 500,000,000 gallons of water were released by the breaking of the dam, and the flood was followed by fires. The dam was built two years ago to span the little valley formed by Freeman Run. The dam was known to be weak, and its engineer had so reported to the paper corporation. Physicians and nurses as well as fire fighters, constabulary and militia were rushed to the scene. The Pennsylvania Water Supply Commission will investigate the breaking of the dam, which was constructed before the commission was created.——Governor Dix, of New York, has removed from office Lawrence J. Gresser, president of the Borough of Queens, New York City.——The New York State Athletic Commission has revoked the license of the Madison Square Athletic Club, which, under the new law, has conducted prizefights in the Madison Square Garden, New York City.——The new charter for New York City passed the New York Assembly September 28 by a vote of ayes 76, noes 57. The charter had not a single vote to spare, as it required just seventy-six votes to pass it. Of the 85 Democrats in the Assembly (not counting the 1 Independence Leaguer) 6 voted no. This is the so-called Gaynor charter, which has been riddled with amendments, and which was very generally opposed by the New York City press and public, but which Tammany has exerted every effort to enact. The charter was subsequently thrown out by the State Senate.——Both branches of the New York Legislature have passed direct primary bills. The indications are that one of these will be placed on the statute books.——About 18,000 shopmen, employees of the Harriman lines, includ-

g the Illinois Central Railroad, went
strike September 30, in accordance
ith the instructions of the heads of the
arious international unions affected, to
enforce demands of recognition of the Shopmen's Confederation. —— From Dawson, Alaska, comes news of a great stampede, as Yukon navigation is closing, to Ruby City, below Fort Gibbon. Twenty-five hundred prospectors from older Yukon gold camps are rushing there. Ruby is now a tent city, but hundreds of cabins will be built as winter approaches. The Northern Commercial Company and independent traders have this week landed barges with supplies. Stampeders are going by steamboats and gasolene launches. Rich diggings have been found on several creeks. The formation is white channel with blue mud underneath, as in the Klondike diggings.

**Canada**

The Canadian Parliament will assemble November 18, unless the date is altered to suit the convenience of the new Prime Minister. ——The greatest political demonstration seen in Ottawa since the early victories of Sir Wilfrid Laurier was made September 26, by happy Conservatives, who marched and drove by thousands by R. L. Borden's house and took the Premier-elect thru the principal streets. Hundreds of banners and transparencies bore such mottoes as "Reciprocity is Dead," "Canada for the Canadians," "One Flag, One Fleet, One Throne," "The Union Jack Forever," "Canada is Good Enough for Us." The Laurier Cabinet has sent in its resignation, and Sir Wilfrid announces that he will take his first holiday in many years by spending a month in California, after which he will return to his post as leader of the opposition of the Twelfth Parliament, which will meet in November.——Earl Grey, the Governor General, speaking at the banquet of the Canadian Club, of Ottawa, September 27, said that

> the great resources of Canada and the character of the Canadian people make it certain that the Dominion will one day be the greatest factor in the British Empire, even exceeding in importance and influence the United Kingdom itself. . . . Some people profess to place reliance on the Monroe Doctrine, but where would that doctrine stand if the British fleet were swept from the seas? The only security for Canada's defense is the supremacy of the British fleet."

**Madero Elected President of Mexico**

Mexico's national election took place on Sunday, the 1st, when presidential electors were chosen. These will meet on the 15th, when the election of Francisco I. Madero, leader of the revolution, will be announced. There was scarcely any opposition to Madero, as candidate for the first place, but when THE INDEPENDENT went to press there was doubt as to the Vice-Presidency. Suarez, Governor of Yucatan and nominated with Madero, was disliked and comparatively unknown. Many voted for Dr. Francisco Gomez, a member of the Cabinet and formerly Madero's agent at Washington. The Catholic party voted for Madero and De la Barra (now President), saying that Madero should have the first place now and expressing a purpose to make De la Barra his successor at the next election. Congress had rejected by a large majority the petitions asking that the election be postponed.——Gen. Bernardo Reyes left Mexico secretly before the election. On the 28th, disguised as a feeble invalid and using an assumed name, he boarded a steamship at Vera Cruz. In a telegram to De la Barra he said he was going away for the good of his country, believing that his departure would promote peace. In interviews he asserted that he had discovered a Maderist plot for his assassination, adding that he would return when his safety could be guaranteed. He desired that his party should retain its organization and be a party of Opposition, upon a platform to be made known hereafter. Madero commented sarcastically upon Reyes's remark, made two weeks ago, that by resorting to arms he could overturn the Government. Reyes well knew, Madero said, that at the beginning of such a venture he would lose his life. After they had "overthrown one dictator, the people could not be tricked into taking up another."——Fifteen Magonists were killed in an engagement with Maderist soldiers in the north a few days before

the election and it is reported that at about the same time sixty Magonists were put to death in Guanajuata. The story is that an army officer, disguised as a priest, took the confessions of twenty Magonists who had been condemned; that these confessions implicated forty Mexicans in addition and disclosed a plot for a widespread movement; that the forty were arrested, and that these and the confessing twenty were then promptly shot.——At the end of last week, Zapata and Almazan, bandit commanders of 600 men, were making terms for surrender. There was still much disturbance in the State of Chiapas, where Indian rebels recently sacked a town and were guilty of many atrocities, such as the torturing of children and women. They crucified a resident of Acala named Winceslao France. Believing that one Rivergo, secretary of the Governor of the Federal district, was in some way responsible for the uprising in Chiapas, mobs in the capital on the 26th ult. demanded his resignation. Mounted police charged the mobs, killing two men and wounding seventeen.

**Cuba and Other Islands**

Francisco Gonzales and Francisco Barenguer, editors of labor papers in Havana, with four Spanish Socialists, were seized by the authorities last week and placed on board a Hamburg Line steamship to be carried to Vigo, Spain. They were not allowed to communicate with their families. In explanation it was said that they had fomented recent strikes and had been expelled as "pernicious foreigners." Since their departure, the workingmen have been holding indignation meetings.——Cuba's sugar crop promises to be the largest ever known on the island. The record is held by that of 1909, which was 1,800,000 tons. There is still danger of injury by cyclones in the present month.——Some foresee much disturbance in Cuba, if President Gomez, who has repeatedly promised to retire, should stand for reelection. It is feared that the hostile branch of the Liberal party would cause a revolution. The Conservative candidate will probably be Señor Menocal, manager of sugar properties representing $20,000,000 of American capital.——Santo Domingo's commissioner has returned from Washington without reaching an agreement for arbitration of the boundary dispute with Hayti. It is said that the Haytian revolution has caused delay.——Commander Moffett reports to our Navy Department that he has formally taken possession, in the name of the United States, of an uninhabited island called Bishop Rock, lying off the coast of Mexico, a little south of the California boundary. Mexico has never claimed it.——Ensign Charles E. Hovey, Naval Academy, '07, of New Hampshire, commander of the gunboat "Pampanga," was killed and three sailors were wounded, last week, by hostile natives on one of the Basilan islands, which lie just south of Zamboanga, in the Philippines. These natives are fanatics, whose principal weapon is the blowgun, in which poisoned darts are used.——The Philippine Government is now making loans on agricultural property at 6 per cent.——A Denver newspaper, believing that we should not continue to hold the Philippines, has addressed letters to Governors, members of Congress and many prominent citizens, asking for comment upon its proposition, which is that we should sell the islands to Japan and use the money paid for them in developing the arid lands of the West and the swamp lands of the South.——An appropriation of $25,000 granted by the Philippine Legislative Assembly is to be expended by the Government in advertising the islands.

**Central and South America**

Nicaragua's Minister at Washington published a statement, at the end of last week, emphatically denying certain reports that Nicaragua was greatly disturbed and on the verge of another revolution. The Government, he asserted was firmly established, and a loan would soon be negotiated in the United States. It was not true, he added, that Costa Rica was assisting ex-President Zelaya in plots for an uprising.——Costa Rica has contracted in Paris for a loan of $7,000,000. The lenders are Albert Kahn, of Paris; Behrens & Sons, of Hamburg, and Speyer & Co., of New

York. The security will be a first lien on the revenues of the liquor monopoly, together with a lien upon all other revenue. Costa Rica agrees to negotiate no additional loan within two years.——A series of earthquake shocks in Costa Rica, near the Pacific coast, last week, partly destroyed the town of Los Canos de Aguas Zarcas. Four persons were killed and a church two hundred years old was wrecked. For nearly a day the water was withdrawn from the Cano

VLADIMIR KOKOTZKOFF

Grande River, and very little is running now in the river bed.——For the first time the Government of Panama has lost control of the National Assembly. A special session was called last week for legislation concerning the projected Panama and David railroad. Altho this is the Assembly that elected President Arosemena, it promptly elected officers hostile to him and adopted a resolution declaring that if he intended to be a candidate for re-election he must resign six months before election day. This appears to be required by the Constitution. Some time ago, the President obtained a grant of six months' vacation, the beginning of which was to be just six months prior to the election. He had been advised that the requirement of the Constitution could be satisfied in this way. ——Under a new law, foreigners who, as contractors' agents, urge Panama Canal laborers to leave the Zone for work in Brazil or elsewhere may be summarily expelled from the republic, and natives who seek to draw away laborers may be fined from $1,000 to $3,000.——President Leguia, of Peru, signed the new Amnesty bill on the 26th ult., and at midnight all the political prisoners, sixteen in number, were set free. They were warmly greeted by many awaiting their release. Because of the President's conciliatory attitude, the people are rejoicing. —— Earthquake shocks, last week, in Ecuador, caused much loss of property in the city of Riobamba, 85 miles from Guayaquil.

**Italy Declares War**

On September 28 Italy precipitated action by delivering to the Porte an ultimatum announcing its intention of occupying Tripoli and Cyrene, and demanding within twenty-four hours a reply indicating compliance. Among the reasons given for this measure in the note dispatched by the Minister of War, Marquis di San Giuliano, to the Italian Chargé d'Affaires at Constantinople, Signor di Martino, are the following:

"During a long series of years the Government of Italy never ceased to make representations to the Porte upon the absolute necessity of correcting the state of disorder to which the government of Turkey had abandoned Tripoli and Cyrene. These regions should be admitted to the benefits of the progress realized by other parts of the Mediterranean and Africa.

"This transformation, which is imposed by the general exigencies of civilization, constitutes for Italy a vital interest of the first order by reason of the slight distance separating these countries from the coasts of Italy. Notwithstanding the attitude taken by the government of Italy, which has always accorded its loyal support to the imperial government in the different political questions of recent times; notwithstanding the moderation

and patience shown by the government of Italy, the news concerning Tripoli have been badly received by the imperial government, but, more than that, all enterprise on the part of Italians in the regions mentioned has been systematically opposed and unjustifiably crushed.

"The Royal Government has received from its consular agents in Tripoli and Cyrene information that the situation is extremely grave because of the agitation prevailing against Italian subjects, which is incited in evident fashion by officers and other functionaries of authority.

"This agitation constitutes an imminent danger not only to Italian subjects, but to foreigners of all nationalities, which requires them for their own security to embark and leave Tripoli without delay.

"The arrival at Tripoli of Ottoman military transports, which the Royal Government has not failed to observe, appears preliminary to serious events, aggravates the situation, and imposes on the Royal Government the obligation absolutely to prepare for the dangers which will result.

"The Italian government, having the intention henceforth to protect its interests and its dignity, has decided to proceed to the military occupation of Tripoli and Cyrene."

To this peremptory note the Turkish Government replied in a conciliatory manner, stating that, according to the latest reports, conditions in Tripoli were absolutely normal and that the Italian residents were amply protected and Italian interests in no danger. Any causes of complaint would be immediately investigated and remedied, and the hope was exprest that Italy would desist from the proposed action. The Turkish Government at the same time sent a protest to the Powers, which, however, declined to intervene, altho the German Ambassador to Constantinople, Baron von Biederstein, visited the Italian Embassy in an attempt to obtain a delay or reconciliation. On the afternoon of the following day, Friday, September 29, the Italian Chargé d'Affaires presented a formal declaration of war in the following terms:

"The Italian embassy, carrying out the orders of the King, has the honor to notify you that the delay accorded by the royal government to the Porte, with a view to the realization of certain necessary measures, has expired without a satisfactory reply reaching the Italian government. The lack of this reply only confirms the bad will, or want of power, of which the Turkish government and authorities have given such frequent proof, especially with regard to the rights and interests of Italians in Tripoli and Cyrenica.

"The royal government, consequently, is obliged itself to safeguard its rights and interests as well as its honor and dignity by all means at its disposal. Events which will follow can only be regarded as the necessary consequence of conduct followed so long by the Turkish authorities.

"The relations of peace and friendship being therefore interrupted between the two countries, Italy considers herself from this moment in a state of war with Turkey."

A statement given out to the press in justification of the action of Italy enumerates a long list of alleged "vexations and abuses," none of which, however, seem to be so serious as to be beyond the possibility of settlement by the ordinary diplomatic methods. Among them are: The forced marriage and conversion to Mohammedanism of the sixteen-year-old daughter of an Italian railroad laborer in Adana; the search and seizure of Italian vessels on the Red Sea suspected of carrying contraband arms to the Arabian rebels; the boycotting of the Tripolitan branch of the Bank of Rome; interference with the purchase of land and development of natural resources in Tripoli by Italians; resistance to archeological and mineralogical explorations; the hostile tone of the native press; and failure to bring to justice the murderers of two Italians. The statement concludes as follows:

"The limit had been reached, the violent attacks, beyond all measures injurious, of the Turkish Ottoman press, the systematic resistance and the utter lack of good faith in the subordinate authorities, the extraordinary series of incidents and complaints of all kinds, augmenting day by day, have finally shaken and tired public opinion, the press, the Parliament and the government of Italy.

"Italy now was compelled to give up any and every hope of a peaceful settlement with Turkey, having lost faith in the many vain words and mendacious promises given by Turkey in the last years, having lost patience, decided to abandon her policy of forbearance, which might be reproached as a sign of weakness and an acknowledgment of inferiority, has firmly resolved to obtain with the greatest energy the respect of her own rights and the protection of her own interests.

"The blame will fall upon those who for the last three years have daily provoked us, causing by way of small or serious incidents an atmosphere of hostility in the several provinces of the empire, and especially Tripolitana, thus rendering uncertain the safety of the Italian subjects and dangerous the carrying on of the peaceful commerce of Eritrea in the Red Sea."

**The Outbreak of Hostilities**

Promptly upon the declaration of war the Duke of the Abruzzi, in command of a torpedo squadron off the harbor of Prevesa, near the Greek boundary, began the attack on Turkish gunboats. In fact, the attack, which began at 3 o'clock in the afternoon, may have preceded the declaration, for it is said bor. One of them was driven ashore and burned. The crew escaped to land. A number of Turkish fishing boats were picked up here and there very much to the surprise of their owners, who had not heard of the war.——Tripoli was blockaded by a force of four Italian cruisers and the garrison summoned to surrender within twenty-four hours.

TRIPOLI AND THE SCENE OF HOSTILITIES

that the note was not delivered at 2 p. m., as was planned, but at 4.30, owing to the fact that the Italian Chargé d'Affaires could not find the Grand Vizier at the proper time. The Vice-Admiral, the Duke of the Abruzzi, who had established a blockade to protect Italian commerce in the Adriatic, was successful in checking the attempt of two of the Turkish torpedo boats from leaving the har- The demand was refused. The Turkish transport "Derna" was captured by the Italians in the harbor, but not before she had landed eleven cannon and 16,000 rifles, which were sent inland by camel trains. Most of the Italian women, children and priests, about 600 in all, were brought from Tripoli to Syracuse in the steamship "Hercules," chartered by the Bank of Rome.——The force despatched

to Tripoli under General Caneva is said to number more than 35,000 men, comprising eight regiments of infantry, two of sharpshooters, 1,000 cavalry and artillery. The mobilization of the troops seems to have been effected without serious difficulty and to have aroused considerable enthusiasm, altho there were anti-militarist riots in several places. The general strike ordered by the socialists to stop the war did not materialize.——The Committee of Union and Progress, the power behind the throne in Turkey, is outspoken in its demand for resistance to the Italian aggression. The first effect of the ultimatum was the overthrow of the Ministry. Hakki Pasha resigned as Grand Vizier, and Said Pasha, President of the Senate, will take his place. Shefket Pasha will retain his position as Minister of War. The Italians resident in Turkey are under the protection of the German Ambassador. The United States will take charge of the Ottoman subjects in Italy.——On October 2 a statement was issued at Berlin by the Foreign Office, to the effect that the report of the German Ambassador at Constantinople having presented Italian proposals for peace was "premature." This seemed to indicate that such proposals were expected as soon as the occupation of the Tripolitan coast had been effected.

**Foreign Notes**

The Irish railroad strike is gradually subsiding, altho conditions are not yet normal. The companies refuse to reinstate many of the men. A strike of the bakers in Dublin has cut off two-thirds of the supply of bread and caused great suffering in poor families. The railroad strike did not prevent the running of excursion trains to the great Unionist mass meeting at Belfast, where it was voted to refuse to acknowledge the authority of any Home Rule Government. A committee has been appointed to arrange for a provisional government for Ulster to assume power on the day of the passage of a home rule bill.——Dmitri Bogrof, the assassin of Premier Stolypin, was condemned to death by court martial and hanged at Kiev September 25.——The exchange of notes between France and Germany over the Morocco question has continued during the week, but it is reported that the two governments have practically come to an agreement, and the discussion now carried on concerns details and wording.——The cause of the destruction of the French battleship "Liberté" has not been certainly ascertained. Some lay it to the spontaneous combustion of powder B, a nitro-cellulose compound, which has been suspected of deterioration and probably was responsible for the explosion on the "Jena." Others believe that it was a case of sabotage due to anti-military syndicalists who set fire to the coal bunkers as they had done in other ships. According to official estimates the dead number 235 and the injured 160. Five men were rescued alive from the ruins more than a day after the disaster. The force of the explosion was so great as to throw bodies upon the decks of the other vessels in the harbor, and a piece of the armor plate of the "Liberté," weighing 37 tons, struck the "République," damaging it so that it will take several months for repairs. The German Emperor sent his condolences and sympathy to the French Government.——The attempt of the ex-Shah of Persia, Mohammed Ali Mirza, to regain the throne seems to have failed, in spite of the favor which it received from Russia. His brother, Salar ed Dowleh, who started the insurgent movement, was decisively defeated by the Government near Savah, with a loss of 500 killed and 200 prisoners. Seven big guns and other munitions were captured. The Government force is reported to have numbered 2,000 and the insurgents 4,000.——The siege of Cheng-tu has been raised by the arrival of 1,500 Chinese troops from Tibet. The missionaries and foreign residents were found safe. The rebels have withdrawn to the west and south and the Government troops are in pursuit.——A royalist plot for the restoration of the ex-King Manuel, formed in Oporto by the Catholic Club, was discovered in time to arrest the conspirators. Some 200 had assembled during the night in the Crystal Palace of Pleasure, but at daybreak they found the building surrounded by troops with machine guns and were compelled to surrender.

# Twelve Major Prophets of Today—III

BY EDWIN E. SLOSSON, Ph.D.

[The aim of this series is to acquaint the general reader with the personality of certain leaders of modern thought and to give him a sufficient idea of the character of their philosophy of life to enable him to judge which of them it will be worth his while to study further. The first article, on the Belgian dramatist and essayist, Maurice Maeterlinck, appeared May 4 and the second, on the French philosopher, Henri Bergson, June 8. The subject of the next sketch will be the Russian physiologist, Elie Metchnikoff, head of the Pasteur Institute Paris. Later articles will be devoted to Wilhelm Ostwald, Ernst Haeckel, Rudolf Eucken, H. G. Wells, G. B. Shaw, G. K. Chesterton, F. C. S. Schiller and John Dewey.—EDITOR.]

## Henri Poincaré

"The scientist does not study nature because it is useful; he studies it because he delights in it, and he delights in it because it is beautiful. If nature were not beautiful, it would not be worth knowing, and if nature were not worth knowing, life would not be worth living. Of course I do not here speak of that beauty that strikes the senses, the beauty of qualities and of appearances; not that I undervalue such beauty, far from it, but it has nothing to do with science; I mean that profounder beauty which comes from the harmonious order of the parts, and which a pure intelligence can grasp. This it is which gives body, a structure so to speak, to the iridescent appearances which flatter our senses, and without this support the beauty of these fugitive dreams would be only imperfect, because it would be vague and always fleeting. On the contrary, intellectual beauty is sufficient unto itself, and it is for its sake, more perhaps than for the future good of humanity, that the scientist devotes himself to long and difficult labors.

"It is, therefore, the quest of this special beauty, the sense of the harmony of the cosmos, which makes us choose the facts most fitting to contribute to this harmony, just as an artist chooses from among the features of his model those which perfect the picture and give it character and life. And we need not fear that this instinctive and unavowed prepossession will turn the scientist aside from the search for the true. One may dream a harmonious world, but how far the real world will leave it behind! The greatest artists that ever lived, the Greeks, made their heavens; how shabby it is beside the true heavens, ours!"—Poincaré's *The Value of Science*, p. 8.

SUCH language as this is extremely disconcerting to those who hold the popular notion of science and scientists; regarding science as a vague impending mass of solid fact, immutable, inexorable, threatening the extinction of all such things as art, sentiment, poetry and religion, only to be diverted by a determination to remain ignorant of it; regarding men of science as mere calculating machines, mechanically grinding out logical grist for utilitarian purposes. Mathematical astronomy is surely one of the sciences, the most rigid, remote and recondite of the sciences. Yet here is the leading mathematical astronomer of the age talking about it as tho it were one of the fine arts, a thing of beauty that the artist creates for his own delight in the making of it and shapes in accordance with his own ideas of what is harmonious.

Now we cannot throw out of consideration M. Poincaré's opinion on the ground that he does not know what he is talking about. A man who has made as much science as he has ought to know how science is made, and what for. To most of us nature—or to avoid hurting our own feelings let us rather say, opportunity—has denied the privilege of knowing this by experience. Consequently M. Poincaré is an especially interesting man to study, for he is willing to tell us not only what a man of science is but also how it feels to be one. No other living man of equal eminence has been so frank and accommodating in the self-revelation of his methods or so willing to submit himself as a subject of observation. We are admitted to the laboratory of a mathematician and we can watch the mechanism of scientific thought in action.

So far as he is concerned he repudiates the idea that science is purely utilitarian in the most emphatic language. August Comte said that it would be idle to seek to know the composition of the sun since

this knowledge would be of no use to sociology. Against such a charge of uselessness Poincaré eloquently defends science by showing the practical value of astronomy even from Comte's point of view, but in conclusion asserts his own opinion very plainly:

"Was I wrong in saying that it is astronomy which has made us a soul capable of comprehending nature; that under heavens always overcast and starless, the earth itself would have been for us eternally unintelligible; that we should there have seen only caprice and disorder; and that, not knowing the world, we should never have been able to subdue it? What science could have been more useful? And in thus speaking I put myself at the point of view of those who only value practical applications. Certainly, this point of view is not mine; as for me, on the contrary, if I admire the conquests of industry, it is, above all, because they free us from material cares, they will one day give to all the leisure to contemplate nature. I do not say: Science is useful, because it teaches us to construct machines. I say: Machines are useful, because in working for us, they will some day leave us more time to make science. But finally it is worth remarking that between the two points of view there is no antagonism, and that man having pursued a disinterested aim, all else has been added unto him."—*Value of Science*, p. 88.

It is this insistence upon the esthetic value of science that causes him to shrink from being called a "pragmatist," altho those who accept that name have always laid unusual stress upon the esthetic factor in thinking. But in his theory of knowledge Poincaré is decidedly pragmatic and no one has given a clearer exposition or stronger expression to the practical mode of thought by which the natural sciences have made their progress and which is now being extended to the fields of metaphysics, religion, ethics and sociology. Poincaré's favorite word is "convenient" (*commode*). Theories are strictly speaking not to be classed as true or false. They are merely more or less "convenient." For example:

"Masses are coefficients it is convenient to introduce into calculations. We could reconstruct all mechanics by attributing different values to all the masses. This new mechanics would not be in contradiction either with experience or with the general principles of dynamics. Only the equations of this new mechanics would be *less simple*."—*Science and Hypothesis*, p. 76.

"We have not a direct intuition of simultaneity, nor of the equality of two durations. If we think we have this intuition, this is an illusion. We replace it by the aid of certain rules which we apply almost always without taking count of them. But what is the nature of these rules? No general rule, no rigorous rule; a multitude of little rules applicable to each particular case. These rules are not imposed upon us and we might amuse ourselves by inventing others; but they could not be cast aside without greatly complicating the laws of physics, mathematics and astronomy. We therefore choose these rules, not because they are true, but because they are most convenient, and we may recapitulate them as follows: 'The simultaneity of two events or the order of their succession, the equality of two durations, are to be so defined that the enunciation of the natural laws may be as simple as possible; in other words, all these rules, all these definitions are only the fruit of an unconscious opportunism."—*Value of Science*, p. 35.

"Time should be so defined that the equations of mechanics may be as simple as possible. In other words, there is not one way of measuring time more true than another. That which is generally adopted is only more *convenient*. Of two watches, we have no right to say that one goes true, the other wrong: we can only say that it is advantageous to conform to the indications of the first."—*Value of Science*, p. 30.

"Behold then the rule we follow and the only one we can follow: when a phenomenon appears to us as the cause of another, we regard it as anterior. It is therefore by cause we define time."—*Value of Science*, p. 32.

"Experience does not prove to us that space has three dimensions. It only proves to us that it is convenient to attribute three dimensions to it."—*Value of Science*, p. 69.

"It has often been observed that if all the bodies in the universe were dilated simultaneously and in the same proportion we should have no means of perceiving it, since all our measuring instruments would grow at the same time as the objects themselves which they serve to measure. The world, after this dilatation, would continue on its course without anything apprising us of so considerable an event."—*Value of Science*, p. 39.

But Poincaré goes farther and shows not only that two such worlds of different sizes would be absolutely indistinguishable, but that they would be equally indistinguishable if they were distorted in any manner so long as they corresponded with each other point by point. This conception of the relativity of space may be thought a little hard to grasp, but Mr. Poincaré is kind enough to suggest a way by which any one may see it for himself if he has ten cents to admit him to one of those hilarious resorts where lifesize concave and convex mirrors are to be seen.* You may think yourself a gentleman of proper figure,

*Science et Méthode, p. 101.

Votre bien devoué

Louis A. J.

that is to say, somewhat portly, and you look upon the tall slim shape that confronts you in the cylindrical mirror as absurdly misshapen. But you would find it difficult to convince him of his deformity. His legs, as well as yours, fulfill the requirement that Lincoln laid down as their proper length, that is, they

tweak from the body to the ground. If you touch your chin with your thumb and your brow with your forefinger so does he. It occurs to you that here is a case where your knowledge of geometry would, if ever, prove useful, but when you appeal to it you will find that the geometry of his queer-looking world is just as good as yours, in fact is just the same. You get a foot rule and measure yourself; 70 inches high, 14 inches in diameter at the equator, ratio 5:2. But meanwhile the mirror man is also measuring himself and his dimensions come out exactly the same as yours, 70 and 14 and 5:2, for when he holds the rule perpendicular it lengthens and when horizontal it shrinks. Lines that in your world are straight are curved in his, but you cannot prove it to him, for when he lays his straight-edge against these curves of his, behold it immediately bends to correspond. By this time, finding it so difficult to prove to the mirror man that you are right and he is wrong, it occurs to you that perhaps he isn't, that he may have just as much reason as you for believing that his is the normal, well-proportioned world, and yours the distorted image of it. Since then you have no way of perceiving the absolute length, direction or curvature of a line, your space may be as irregularly curved and twisted as it looks to be in the funniest of the mirrors and you would not know it. Now the principle of the pragmatist is that anything that does not make any difference to anything else is not real. The reason why we have not been able to discover any differences between the mirror space and our space, each considered by itself, is because there is none. Or to return to the language of Poincaré, "space is in reality amorphous and the things that are in it alone give it a form." Why do we say that space has three dimensions instead of two or four or more? Why do we stick to an old fogy like Euclid when Riemann and Lobachevski proffer us new and equally self-consistent systems of geometry wherein parallels may meet or part? Because:

"by natural selection our mind has *adapted* itself to the conditions of the external world. It has adopted the geometry *most advantageous* to the species or, in other words, *the most convenient*. Geometry is not true, it is advantageous."

Such language may pass without notice in university halls, for all scientists are more or less clearly conscious of the provisional and practical nature of the hypotheses and conventions they employ. But to the outside world it sounds startling. To some it seemed that the foundations of the universe were being undermined. Others saw in it a confession of what Brunetière had called "the bankruptcy of science" and openly rejoiced over the discomfiture of the enemy of the Church. Now Poincaré had chanced to use in discussing the relativity of motion the following illustration:

"Absolute space, that is to say, the mark to which it would be necessary to refer the earth to know whether it really moves, has no objective existence. Hence this affirmation 'the earth turns round' has no meaning, since it can be verified by no experiment; since such an experiment not only could not be either realized or dreamed by the boldest Jules Verne but cannot be conceived of without contradiction. Or rather these two propositions: 'The earth turns round' and 'it is more convenient to suppose the earth turns round' have the same meaning; there is nothing more in the one than in the other."—*Science and Hypothesis*, p. 85.

This remark was at once seized upon by the Catholic apologists and the Galileo case once closed by the voice of Rome was reopened for the admission of this new evidence. If the Ptolemaic and the Copernican thories are equally true and the choice between them is merely a matter of expediency, was not the Holy Inquisition justified in upholding the established theory in the interests of religion and morality? Mgr. Bolo, an eminent and sagacious theologian, announced in *Le Matin* of February 20, 1908, that M. Poincaré, the greatest mathematician of the century, says that Galileo was wrong in his obstinacy. To this Poincaré replied in the whispered words of Galileo:

"E pur si muove, Monseigneur."

In a later discussion of the point he explains that what he said about the rotation of the earth could be equally well applied to any other accepted hypothesis, even the very existence of an external world, for "these two propositions, 'the external world exists' or 'it is more convenient to suppose that it exists' have one and the same meaning." The Copernican theory is the preferable because

it has a richer, more profound content, since if we assume the earth is stationary we have to invent other explanations for the flattening at the poles, the rotation of Foucault's pendulum, the trade winds, etc., while the hypothesis of a revolving earth brings all these together as the effects of a single cause.

Mr. Le Roy, a Catholic pragmatist and a disciple of Bergson's, goes much further than Poincaré in regard to the human element in science, holding that science is merely a rule of action and can teach us nothing of truth, for its laws are only artificial conventions. This view Poincaré considers to be dangerously near to absolute nominalism and skepticism and in his controversy with Le Roy* he shows that the scientist does not "create facts as Le Roy said, but merely the language in which he enunciates them." Of the contingence upon which Le Roy and Boutroux insist, Poincaré will admit only that scientific laws can never be more than approximate and probable. Even in astronomy, where the single and simple law of gravitation is involved, neither absolute certainty nor accuracy can be attained. Therefore we cannot safely say that at a particular time Saturn will be at a certain point in the heavens. We must limit ourselves to the prediction that "Saturn will *probably* be *near*" such a point.

In an address before the International Philosophical Congress at Bologna last April Professor Poincaré discussed again the question of whether the laws of nature may not change. He admits that there is not a sole law that we can enunciate with the certainty that it has always been true in the past. Nevertheless, he concludes, there is nothing to hinder the man of science from keeping his faith in the principle of immutability since no law can descend to the level of a secondary and limited law without being replaced by another law more general and more comprehensive. He considers in particular the possibility that in the remote past the fundamental laws of mechanics would not hold, for since the energy of the world has been continually dissipating in the form of heat there must have been a time when bodies moved faster than they do now. But according to the recent theories of matter, no body can travel faster than light, and with velocities approaching that of light its mass is no longer constant but increases with its velocity. This, of course, would play havoc with all of Newton's laws, which then we should have to regard as limited in their scope to such ordinary conditions and moderate motion as we see about us now.

But even at present we can hardly regard them with the same implicit confidence as formerly. Take, for example, Newton's law that action and reaction are equal and opposite. When a ball is fired from a cannon, the cannon recoils at the same time and with the same energy that the ball goes forward. But suppose instead of a cannon we have a lamp with a reflector sending a beam of light into space. It has been deduced mathematically and proved experimentally that light exerts a minute but measurable pressure on an object which it strikes. The reflector therefore recoils like the cannon, but where is the ball if light is an immaterial wave motion? To be sure if the ray of light strikes some planet out in space it would give it an impulse equal and opposite to that originally imparted to the reflector on our earth. But what if the light went on thru vacant space and never hit anything at all? A law that may have to wait several thousand years for its validation and may even fail of it altogether is not what the layman has in mind when he thinks of immutable and infrangible laws governing the universe.

But it is rather important just now that the layman gets to understand what the scientist means when he talks of laws, theories and hypotheses. For we are in the midst of a stupendous revolution in science. Our nicely arranged nineteenth century cosmos seems to be dissolving into chaos again. We have seen the elements melt with fervent heat and we can no longer rely upon the uniformity of atomic weights. The laws of the conservation of matter and energy, which were the guiding stars of research to the last generation, are becoming dimmed. The old-fashioned ether, in its time a useful but never entirely satisfactory contrivance, for it had to be patched up repeatedly with divers new properties to

*Part III—"The Value of Science."

enable it to bear the various duties thrust upon it, seems no longer competent to stand the strain and may have to be sent to the scientific scrap heap at any moment. We hear physicists of supposed sanity assert that all bodies contract in the direction of their motion and that their weight varies with their speed and the direction in which they are going. We read of "atoms of light," and of corpuscles of electricity which, tho they are but a thousandth part of the hydrogen atom, are caught and counted and weighed one by one.

Now what puzzles the lay mind is the calmness with which the scientists survey this crash of worlds and shock of systems. They do not have the mien of exposed impostors. They are not, like the augurs of decadent Rome, unable to meet without laughing in each other's faces. They do not resent the overthrow of their former idols. They have no fear of heretics, consequently no hatred for them. They regard all this iconoclasm with a mild curiosity quite in contrast to their intense and personal interest in science generally. It is hard to get out a quorum at the Association for the Advancement of Science to hear a discussion of the principle of relativity with all its revolutionary consequences.

Compare this apparent indifference to the fate of fundamental principles in scientific circles with what would happen in a Presbyterian assembly if it should be proposed to eliminate predestination from the Westminster Confession or in an Episcopal convocation if the Virgin Birth were denied; with what would happen in a stockholders' meeting if doubt were expressed as to the rights of capital or in a socialist convention the class conflict were questioned. Now the existence of the ether has the same importance to scientific thought that predestination has to theological or capitalism to economic thought. Its refutation or modification would be quite as upsetting to faith and practice. Yet scientists are men; they have red blood in their veins and it not infrequently shows in their cheeks when they debate something that seems to them worth while. Pure theory rarely seems to them worth while because it is recognized as pure conventionality and convenience.

The scientific man, especially the scientific investigator, holds his theories with a light hand, but keeps a firm grip on his facts. This is just the opposite of the lay attitude toward science. If the layman is interested in knowing the speed of light it is because he thinks that he learns from it that all space is filled with a rigid elastic solid, at which he cannot but wonder. The scientist is interested in the ether because it helps him in his calculation of the speed of light.

A lecturer on wireless telegraphy will use in the course of the hour two or three more or less contradictory conceptions of electricity. If afterward you call his attention to the inconsistency and ask him which is right and which is wrong, you will not get a very satisfactory answer. He does not know and obviously does not care. You insist upon his telling you which theory he personally believes in. He really had not thought of "believing" in any of them. If he uses white chalk on the blackboard in preference to red it is not because he denies the existence of red chalk and its occasional usefulness. So, too, the astronomer will speak of the sun's rising and in the next breath of the earth's turning toward the sun, quite innocent of his inconsistency. The botanist alludes to a certain flower as a poppy and again as Eschscholtzia. He means the same thing but is using different languages; in the first case English, in the second case I don't know what.

It is eminently desirable that people should have faith in science, but in order to do that they must have the same sort of faith in it that the scientist has. Otherwise they will regard it as a lot of ingenious fancies which are proved false by each succeeding generation. Science is moulting just now and looks queer. The public ought to understand clearly that the process means growth and not disease. There is another reason now for the popularization of the scientific mode of thought. It is beginning to be applied where entirely different conceptions have so far prevailed—to art, ethics, religion, sociology and the like. This is already arousing a great commotion and will cause more before the process is complete. It will, for example, involve the rewriting and to a large extent the

reinvestigation of history. Poincaré has hinted at this in a passage which seems to me of very great significance:

"Carlyle has somewhere said something like this: 'Nothing but facts are of importance. John Lackland passed by here. Here is something that is admirable. Here is a reality for which I would give all the theories in the world.' Carlyle was a fellow countryman of Bacon, but Bacon would not have said that. That is the language of the historian. The physicist would say rather: 'John Lackland passed by here. That makes no difference to me for he never will pass this way again.'"—*Science and Hypothesis*, p. 102.

The aim of science is prevision and I believe that this will eventually be recognized as the true aim of all knowledge. The historian, or let me say rather the antiquarian, for the historian may have the scientific temperament, values facts for their rarity. The scientist values facts for their commonness. A unique fact, if there be such, would have no possible interest to him. The antiquarian goes about looking for things, facts or furniture, which have been of importance in the past. The scientist is looking only for things that will be of importance in the future.

POINCARE'S RESIDENCE,
63 rue Bernard, Paris, is in the third building on the right

According to Poincaré the proper choice of facts is the first duty of the scientist. He must be able to pick out the significant and reject all the rest. "Invention consists in avoiding the constructing of useless combinations and in constructing the useful combinations which are in infinite minority. To invent is to discern, to choose." It is most desirable to bring together elements far distant from one another. Such unions are mostly sterile, but when this is not the case they are the most fruitful of all. The successful scientist does not, like a shopper, look over one by one all available samples and pick out what he wants. Life is too short. The unsuitable ideas do not even present themselves to his mind. It is as if he were an examiner of second resort who only concerns himself with the candidates who have passed the first test. This preliminary sifting and sorting process is done largely by the unconscious mind, as Poincaré shows by telling how he came to make his first mathematical discoveries:

"For a fortnight I labored to demonstrate that there could exist no function analogous to those that I have since called the fuchsian functions.* I was then very ignorant. Every day I seated myself at my work table and spent an hour or two there, trying a great many combinations, but I arrived at no result. One night when, contrary to my custom, I had taken black coffee and I could not sleep, ideas surged up in crowds. I felt them as they struck against one another until two of them stuck together, so to speak, to form a stable combination. By morning I had established the existence of a class of fuchsian functions, those which are derived from the hypergeometric series. I had merely to put the results in shape, which only took a few hours."—*Science et Méthode*, p. 52.

After working out the deductions from this discovery he went on a geological excursion of the School of Mines. The distractions of travel took his mind from his mathematical labor. But at Constance, just as he was stepping into an omnibus for some excursion the idea occurred to him, without any connection with his previous thoughts, that his fuchsian functions were identical in their transformations with those of the non-Euclidian geometry. He took his seat in the omnibus and continued his conversation, feeling absolutely certain of his discovery, which he worked out at his leisure on his return to his home at Caen.

He next devoted himself to the study of arithmetical questions, without reaching any results of importance and without suspecting that this subject could

*M. Poincaré, in relating these experiences for their psychological interest, is kind enough to say that the non-mathematical reader need not be frightened at these barbarous names for it is not at all necessary for one to know what they mean.

have the slightest connection with his earlier researches. Disgusted at his lack of success he went to pass some days at the seashore, where he was occupied with other things. One day as he was walking on the cliff the thought came to him, brief, sudden and certain as usual, that he had been employing the same transformations in his arithmetical and geometrical work.

He thereupon went back to Caen and undertook the systematic application of his theory. But he was stopped by an insurmountable obstacle and while in this perplexity he was called away to his military service at Mont-Valérien, where he had no time for mathematics. One day while walking on the street the solution of the difficulty appeared to him in a flash. He did not try to think it out at the time, but after his release from the army he completed his memoir without trouble.

These fascinating glimpses into the soul of a mathematician will remind the reader of many other instances of such subconscious assistance on record and doubtless of personal experiences as well. We think of Alfred Russel Wallace at Ternate, his brain inflamed with tropical fever, seized with the sudden inspiration of the theory of natural selection, the key to the biological problems which had perplexed him for so many months. How fortunate that his clerical opponents did not know of this and so could not dismiss evolution as the dream of a diseased imagination. But as James says in his "Varieties of Religious Experience," we have no right to discountenance unwelcome theories as feverish fancies since for all we know 102° may be a more favorable temperature for truth to germinate and sprout in than the ordinary bloodheat of 98°.

We are reminded, too, of Kekule of Bonn puzzling over the constitution of benzene, trying in vain to satisfy six carbon atoms with six hydrogen atoms when they wanted fourteen. In the evening as he sat by the fire his wearied brain refused to rest and he seemed to see the four-handed carbon imps dancing with their one-armed hydrogen partners on the floor. Suddenly six of them joined hands in a ring and the problem was solved. Since then the benzene sextet has been dancing thru hundreds of volumes and has added millions annually to the wealth of Germany. Professor Hilprecht of the University of Pennsylvania has told how a Chaldean priest, custodian of the "Temple Library," appeared to him in a dream and showed him how to put together the fragments of a cuneiform inscription which he had for a long time been striving in vain to translate.

Then there was Stevenson in Samoa, writing for dear life, but not failing to give credit to his "brownies" for doing a large part of his work for him. But the brownies do not work unbidden and they will not make bricks without straw. Poincaré insists upon the necessity of the preliminary period of conscious effort without which these subliminal inspirations never come and the subsequent period of verification, development and application, without which they are fruitless. Such ideas come to him most often in the evening or morning when he is in bed and half awake. He does not regard the operations of his unconscious mind as merely mechanical. On the contrary, it is distinguished by the power of choice, selecting and presenting to the conscious ego only those combinations that seem profitable and important. This choice is made, in Poincaré's opinion, under the guidance of the artistic instinct.

"The usual combinations are precisely the most beautiful; I mean those which can best charm that special sensibility which all mathematicians recognize but at which the profane are tempted to smile. Among the numerous combinations which the subliminal self has blindly formed almost all are without interest and without utility. For that reason they have no action upon the esthetic sensibility and never come into consciousness. Only those that are harmonious and consequently both useful and beautiful are capable of moving that special sensibility of the geometrician of which I spoke, and which, once excited, calls our attention to them and so gives them the chance to become conscious."—*Science et Méthode*, p. 58.

Poincaré, if we may believe what he says on this point, is a poor chess player and absolutely incapable of adding up a column of figures correctly. But the reader should beware of the common fallacy of reversing a proposition of this kind and assuming that if he, too, makes mistakes, in addition he has the mind of a great mathematician. Poincaré's mem

ory is, however, exceptionally good, especially for figures and formulas. On returning from a walk he is able to recall the numbers of the carriages he has met. When he was in the Polytechnic School he followed the courses in mathematics without taking a note and without looking at the syllabus provided by the professor. He is a rapid mental calculator, using auditive imagery rather than visual. He associates colors with the sound of words.*

In this connection may be quoted an anecdote told by M. Jules Sageret:† At a *conférence* in the Superior School of Telegraphy the director called upon him to discuss a very difficult problem in the propagation of the electric current. Poincaré complied and solved the problem without taking any time in preparation. After the *conférence* the director felicitated him on the solution. "Yes," said Poincaré, "I found the value of $x$, but is it in kilograms or kilometers?"

Poincaré does not find it profitable to work more than two hours at a time. His custom is to stay at his desk from 10 o'clock to noon and from 5 to 7 in the afternoon, never working in the evening after dinner. He drinks wine at meals but never smokes. He goes to bed at 10 and rises at 7, but does not sleep soundly.

He is a blond, five feet five inches in height and weighs 154 pounds. His head is unusually large, especially in breadth. His eyes are myopic and unsteady. He stands stoopingly with his wrinkled forehead upturned. He speaks somewhat slowly and with a distraught air, as tho he were thinking of something else, even tho he may be at the time interested and keenly observant. He talks English and German readily and reads Latin and Italian. He is fond of music, especially Wagner.

Of the absent-mindedness that has been characteristic of him from youth, many stories are told. Like most mathematicians he is fond of walking while thinking, his fingers opening and closing in an unconscious gesture. One day on his return from a walk he was surprised to find that he was carrying a wicker cage, new and happily empty. He could not imagine how he had got it, but retracing his steps he found upon the sidewalk the stock of the basket maker whom he had innocently despoiled.

When as an engineering student he made a trip to Austria, his mother was afraid he would drop his portfolio some time without noticing it. So, realizing doubtless that his memory was auditory, she sewed little bells on it. The plan was successful. His mother found on his return that he had brought back in his valise not only the portfolio but also an Austrian bed sheet neatly folded which, some morning, he had mistaken for his night clothes.

These and similar anecdotes were told by M. Frédéric Masson when he welcomed M. Poincaré into the Académie Française, January 28, 1909,* and it must have been a trifle embarrassing to the new member to listen to such a minute analysis of his life and character addressed to him in the second person. How deftly the director of the Academy mingled eulogy and raillery may be seen from a quotation:

"You did not delay revealing your vocation and will be justly cited as the most precocious of infant prodigies. You were nine months old when for the first time as night came your eyes were directed toward the sky. You saw there a star light up. You persistently pointed it out to your mother, who was also your nurse. Then you discovered another with some astonishment, and your reason cried *'Enco·lo la bas!'* A third, a fourth, more cries of joy and equal enthusiasm. You had to be put to bed because you became so excited discovering stars. That evening was your first contact with the infinite and you had inaugurated your courses in astronomy, the youngest professor known."

Henri Poincaré was born April 29, 1854, at Nancy, where his ancestors had long been established. His grandfather was a pharmacist and his father a physician of more than usual scholarship. The name was originally Pontcaré, for, as he says, one can imagine a square bridge but not a square point. His cousin, Raymond Poincaré, son of a distinguished engineer, is one of the most prominent figures in the political world, a member of the Academy, senator and minister.

†Dr. Toulouse has devised a scheme of investigation of psychological studies of men of genius to ascertain in the simplest practical mode of [illegible] and psychology' questionnaire of *Henri Poincaré* (Paris: Flammarion. 3 fr. 50).

‡*Revue des Idées*, 1909, p. 488.

*Masson's address may be found in Le Bon's biography, also in *Popular Science Monthly*. An entertaining account of Poincaré's reception into the Academy was written for *Le Figaro* by André Beaunier and translated for the Boston *Transcript*.

In the Nancy *lycée* he led all his classes and showed a special aptitude for history and literature. At the age of thirteen he composed a five-act tragedy in verse, and since he was a Lorrainer the heroine was of course Jeanne d'Arc. But as soon as he caught sight of a geometry his true vocation became apparent. His instructor ran to his home and announced to his mother, "Madame, your son will be a mathematician."

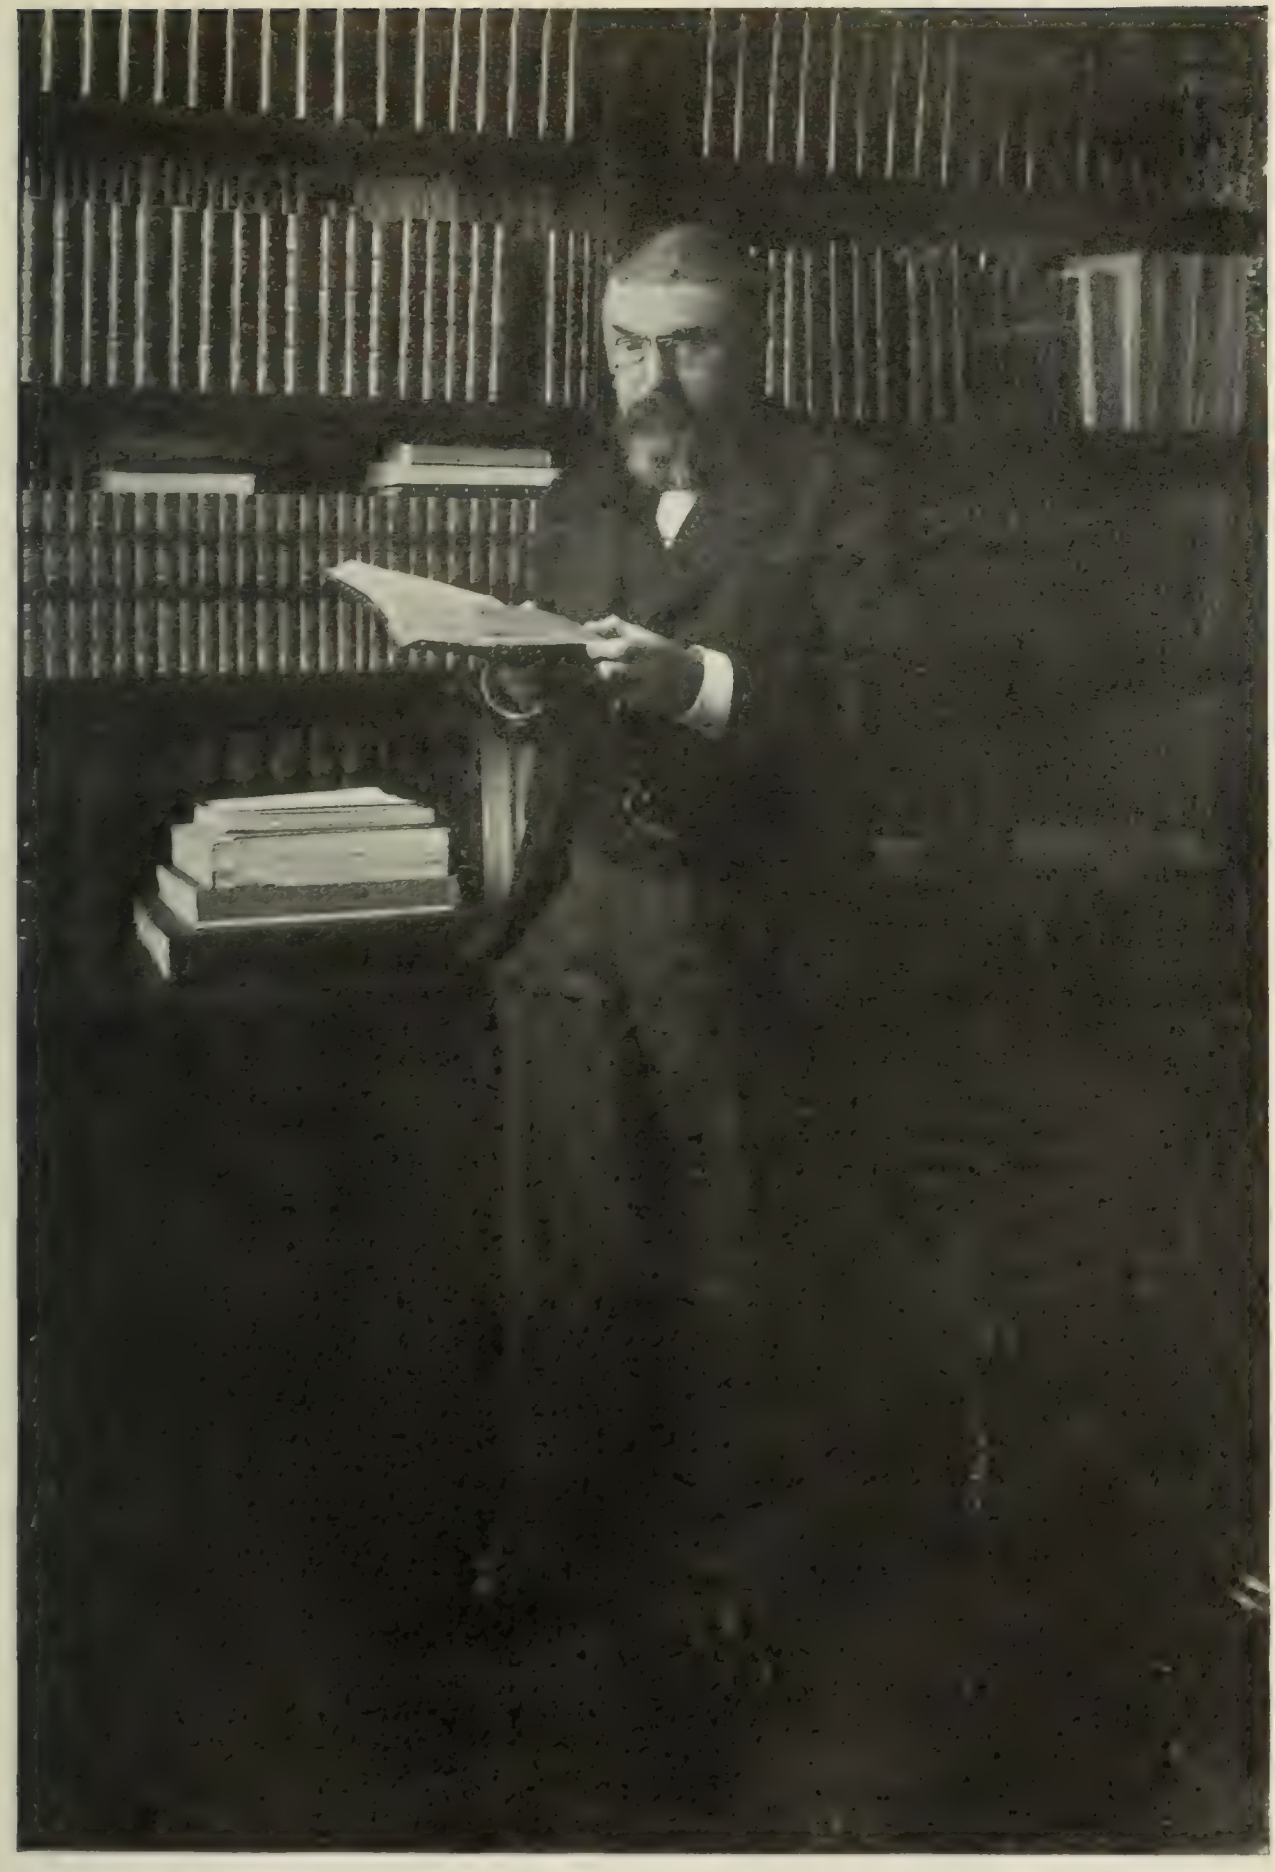
Passing thru the Polytechnic School he entered the National School of Mines and for a few years after graduation he served as engineer in the Government departments of mines and railroads. At the age of twenty-seven he was called to a chair of mathematics in the University of Paris, where he has since remained, also filling the positions of Professor of Astronomy in the Polytechnic School and Professor of Theoretical Electricity in the Professional School of Posts and Telegraphs. He was received into the Academy of Sciences at the early age of thirty-two, and at the time of his election to the French Academy he had been honored by election to membership by thirty-five foreign academies. He took his seat in the Académie Française very appropriately as the successor of Sully-Prudhomme, who likewise was an engineer by profession and a philosopher by temperament. For Poincaré as well as to Sully-Prudhomme science appealed to the esthetic sense as a thing of beauty and an inspiration to the imagination.

He married at the age of twenty-seven and has four children, three daughters and a son. His younger sister is the wife of the philosopher, Emile Boutroux, well known in this country from the course of lectures he gave at Harvard two years ago.

Poincaré has been influential in introducing improved reforms in teaching mathematics, promoting the use of natural and dynamical methods instead of the abstract and static methods of Euclid and Legendre. He is skeptical in regard to religion and indifferent to politics. When called upon to contribute to a symposium on the old question of the scholar in politics,* he responded that savants like all citizens ought to interest themselves in the affairs of the country. But politics has become a profession and a savant who entered into it would have to devote half his time to public business if he would be useful and the other half to his constituents if he wished to keep his seat, so he would have no time for science.

When asked for his opinion on woman suffrage* he replied as follows:

"I see no theoretical reason for refusing the political suffrage to women, married or not. They pay taxes the same as men, and they contribute their sons, so it is even heavier upon them than upon men. Perhaps woman suffrage is the sole means of combating alcoholism. I fear only the clerical influence over women."



Of the achievements that have given M. Poincaré his world-wide fame I am not competent to speak. Readers who would know the significance and value of his work on fuchsian hyper-fuchsian, theta-fuchsian, abelian and elliptical functions must go further for the information. I can only quote the opinions of those most competent to express an opinion as to his contributions to science. In 1905 he received the Bolyai Prize of ten thousand crowns which is awarded by the Hungarian Academy of Sciences every five years for the best work in mathematics done during that period. The official report by Gustave Rados begins as follows:

"Henri Poincaré is incontestably the first and most powerful investigator of the present time in the domain of mathematics and mathematical physics. His strongly marked individuality permits us to recognize in him a savant endowed with intuition, who knows how to draw from the exhaustless well of geometrical and mechanical intuitions the elements and the origins of his profound and penetrating researches, yet using besides the most admirable logical power in working out his conceptions. In addition to his brilliant inventive genius we must recognize in him an ability for the finest and most fruitful generalizations of mathematical relations, which has often enabled him to push back, far beyond the point where others have hitherto been stopped, the limits of our knowledge in different branches of pure and applied mathematics. This was shown already in his first work on automorphic functions with which he began the series of his brilliant publications which must be classed with the greatest mathematical discoveries of all time."

In this country Poincaré has become known largely thru the efforts of Prof. George Bruce Halsted of the State Nor-

*Revue bleue*, June 4, 1907, p. 708.

*La Revue*, 1910.

Photograph by Henri Manuel, Paris

PROFESSOR POINCARÉ IN HIS LIBRARY

mal School of Greeley, Col., who has translated his philosophical works and has for many years been indefatigable in spreading the new gospel of the non-Euclidian geometry. Professor Halsted has at my request kindly contributed the following account of one of Poincaré's astronomical triumphs and of the visit that Professor Sylvester of Johns Hopkins paid to Poincaré many years ago:

"The kernel of Poincaré's power lies in an oracle Sylvester often quoted from Hesiod: Only the genius knows how much more the part is than the whole. He penetrates at once the divine simplicity of the perfectly general case, and thence descends, as from Olympus, to the special concrete earthly particulars. Thus his memoir of 1885, which Sir George Darwin says came to him as a revelation, on a rotating fluid mass, and his book *Les Méthodes nouvelles de la Mécanique céleste,* 1892-9, were ready with prevision when the shocking special case occurrred of Phœbe, ninth satellite, of Saturn, discovered in 1900, afterward found, incredible as it seemed, to be revolving in the direction contrary to that of all the others. It follows that Saturn himself originally rotated in the reverse direction. Again, on February 29, 1908, was found an eighth satellite of Jupiter, Jviii, revolving round Jove in the shocking Phœbe retrograde direction. Zeus must have turned over. All the planets have turned over, and some are now making another somersault. Moreover, Jviii does not even revolve in a closed orbit; its path is an open twister of unreturning turns.

"For Poincaré the inexhaustible source, the lamp of Aladdin, has ever been the non-euclidian geometry. In him the Bolyai-Lobachevski-Riemann germ flowers fair.

"Personally Poincaré is the most lovable of men. At our very first meeting I realized that I had already been intimately associated with him for two years in the person of Sylvester. I told him the story of Sylvester's discovery of him, and he showed me how vividly and tenderly reconnaissant he was toward the great old master.

"Midsummer, and up a stuffy Paris stairway labors a giant gnome, beard on enormous chest, fortunately no neck, for no neck could upbear such a monstrous head, bald but for the inverted halo of hair collaring its juncture with the broad shoulders; small inefficient hands holding big hat and damp handkerchief; breath puffing with the heat and exertion. It is Sylvester, self-driven to seek out the source of new creations strangely akin to his own. At the sought door, open, he pauses, seized by doubt, the person within is so young, so slight, so dazed. Can this be the new incarnation of the eternal world-genius of geometry? But the aloof sensitiveness of the face, the broad sphericity of the head reassure him. This is Henri Poincaré. And so the old King finds the True Prince, who in turn finds himself at last truly comprehended, annointed to the succession, and given high heart to establish his dominion."

HOW TO READ POINCARÉ.

A complete analytical bibliography of Poincaré's writings up to 1909 will be found in Ernest Lebon's *Henri Poincaré* (Paris: Gaultier-Villars), which contains the biographical address of M. Frédéric Masson on his admission to the French Academy and other eulogies. The list comprises 436 articles and books classified as follows: Mathematical analysis, 146; analytical and celestial mechanics, 85; mathematic physics, 78; scientific philosophy, 51; necrology, 17; miscellaneous, 59; an astonishing output for thirty years' work, considering the amount and difficulty of the labor involved in some of the contributions.

The mathematical works of Poincaré are too difficult for the layman and indeed for many professional mathematicians. But there are four volumes of general interest published by Flammarion, Paris, at 3f. 50 each: *La Science et l'Hypothèse, La Valeur de la Science, Science et Méthode* and *Savants et Ecrivains.* The first of these has had a wide popularity, having been translated into English, German, Spanish, Hungarian and Japanese. The English translation of *Science and Hypothesis,* by Prof. George Bruce Halsted (New York; Science Press; $1.50), which appeared in 1905, is introduced by an interesting criticism of Poincaré's philosophy by Prof. Josiah Royce, of Harvard. Two years later *The Value of Science* was published in this country (Science Press; $1). *Science et Méthode,* tho it contains some matter of more general interest than the others, particularly his account of the rôle played by unconscious mind in mathematical invention and his explanation of the newer conceptions of physics, has not yet appeared in English. The fourth volume, *Savants et Ecrivains,* is an evidence of Poincaré's good will rather than his literary talents, as it consists of perfunctory addresses on deceased Academicians, the most extensive being that on Sully-Prudhomme, whose chair he holds.

From either of these two volumes, *Science and Hypothesis* or *The Value of Science*, one can get an idea of Poincaré's philosophy, which is of importance because it is not merely the philosophy of an individual but the point of view of most men of science nowadays, tho rarely so definitely recognized or clearly exprest. Both books consist of a somewhat heterogeneous collection of studies on the method and logic of the mathematical and physical sciences, containing much that the general reader will have to skip because of its use of unfamiliar terms, but it will not be safe for him to skip any whole pages without looking them over carefully, for he is likely to find brilliant and suggestive sentences imbedded in the most unpromising material.

Separate articles by Poincaré, forming chapters from the above mentioned volumes, are accessible in American periodicals. "The Future of Mathematics" in *Monist*, xx, 76-92; also in the 1909 Smithsonian Report which is in every public library. "The Choice of Facts" in *Monist*, xix, 231-239. "The Principles of Mathematical Physics" in the report of the St. Louis Congress of Arts and Sciences, Vol. I, 604-624, and in *Monist*, xv, 1-24. "The Bolyai Prize" (Report on the Work of Hilbert) in *Science*, May 19 and 26, 1911. "Mathematical Creations" in *Monist*, xx, 321-335. *The Value of Science* was first published complete in the *Popular Science Monthly*, September, 1906, and later.

NEW YORK CITY.

# The Decline of Investment Values

BY PIERPONT V. DAVIS

[In our issue of December 29, 1910, Mr. Davis wrote a reply to Professor Smalley, of Michigan, on the subject of railroad rates. These opposing views of a college professor and a Wall Street writer were widely commented on in the daily press and in letters from our subscribers. We have now asked Mr. Davis to write an article on the recent financial disturbances and the heavy decline in security prices. The author is a Yale graduate and associated with the banking house of Plympton, Gardiner & Co., of New York.—EDITOR.]

THERE is a tradition, which is justified by experience, that August is a month of rising prices on the New York Stock Exchange. Since 1880, the month has witnessed rising prices in twenty-one years and declines in only ten years. August, 1911, has violated the tradition. The declines that have occurred, however, are not confined to the New York market alone. The Bourses of Berlin and Frankfort have had days of complete demoralization. In London, Consols—the premier English security—have touched the lowest price recorded since 1831. In New York, the stock of the New York, New Haven & Hartford Railroad has sold at the lowest price since 1874, and the general average of prices has sunk from 124 to 110. The Belgian bank rate has advanced from 3½ per cent. to 5½ per cent.; the German bank rate from 4 per cent. to 5 per cent.; the Bank of England has followed by marking its discount rate from 3 per cent. to 4 per cent., and the Bank of France from 3 to 3½ per cent.

The reasons commonly given for the disturbed state of affairs, at home and abroad, are numerous. In this country the blame is thrust largely upon politics. The radical politicians have undermined confidence, business is seriously restricted, earnings of corporations are shrinking, and a depreciation of values is therefore inevitable. The Secretary of the Treasury has said, "The country is simply pausing to take breath after the headlong flights of 1906 and 1909," but *The Commercial and Financial Chronicle*, disagreeing with him, insists the country is "having the breath completely knocked out of it" by unwise legislation.

Abroad, financial ills are supposed to have their origin in the bitter dispute between France and Germany over Morocco. Powerful bankers in these countries, so the story goes, fearing war, have sold large amounts of securities in London and New York in order to have cash to subscribe to government war loans.

It may be that such reasons are ade-

quate, but cock-sure explanations of the day are not infrequently discarded when a better perspective has been gained. The panic of 1907 is even now a subject of controversy. Not a few people still believe Mr. Roosevelt largely responsible. If one studies that financial crash in its wider application, and realizes that acute money troubles occurred in Egypt, Japan, Chili, Germany, as well as in the United States, the conclusion is unavoidable that, even if President Roosevelt's administration had been as conservative as his predecessor's, the tremendous fall in prices and accompanying business depression must have taken place. Widespread economic evils are due to the economic mistakes of all the people. They could not spring from the mistakes of a single individual, no matter how powerful. Neither could they spring from the malevolent intention of Wall Street, as certain politicians claim to believe. Economic evils are, to borrow Professor Sumner's expression, "mass phenomena," and are not easy of analysis.

Before considering some of the elements which appear to account for the current declining markets, it may be interesting to note the damage already done to prices in New York. The following list shows the highest price (fractions omitted) reached by representative stocks during the first six months of this year, the maximum decline in August and September, and the income, as based on the current rate of dividends, obtainable at the low price:

| | High price in 1911. | Points of decline. | Income at low price. |
|---|---|---|---|
| U. S. Steel..... | 82 | 30 | 9.6% |
| Chesapeake & Ohio.... | 87 | 18 | 7.3% |
| Lehigh Valley ..... | 181 | 30 | 6.7% |
| Union Pacific ..... | 192 | 38 | 6.6% |
| Chic., Milw. & St. Paul. | 133 | 25 | 6.5% |
| Baltimore & Ohio..... | 110 | 16 | 6.4% |
| Northern Pacific ..... | 138 | 27 | 6.3% |
| N. Y., N. H. & Hartford | 151 | 24 | 6.3% |
| Amer. Tel. & Tel..... | 153* | 21 | 6.2% |
| Atchison, T. & S. F.... | 117 | 17 | 6.0% |
| Louis. & Nash..... | 156 | 20 | 5.2% |
| Pennsylvania ..... | 130 | 12 | 5.1% |
| New York Central..... | 115 | 15 | 5.0% |
| International Harvester. | 129 | 30 | 5.1% |
| Canadian Pacific ..... | 247 | 39 | 4.6% |
| American Car & Foun.. | 58 | 13 | 4.4% |

*Includes rights.

In the foregoing list, certain stocks are selling at prices which foreshadow the possibility of a reduction in their dividends. Such cases are not typical. The Union Pacific is earning over 16 per cent. to meet its 10 per cent dividend; the Atchison over 10 per cent. and is paying 6 per cent. It is clear, however, that when six months' money is worth but 4 per cent., practically the entire list might reduce their dividends 1 per cent. and still justify their prevailing prices. In July, 1910, at the bottom of the last big drop in prices, Union Pacific sold at 152¼, Atchison at 90¾, and Steel at 61⅛, but these low prices did not mean lower dividends in the subsequent twelvemonth. It is quite possible that in 1911, as in 1910, unsound fundamental conditions thruout the world will prove to be the cause of the decline, and that politics, hostile legislation, labor disputes and rumors of war are of minor importance.

A study of the behavior of prices in the past may be of value in determining how much weight should be allowed to these more sensational market factors.

Capital is proverbially timid and confidence is truly a plant of slow growth. It is entirely reasonable to assume that the radical politics of the day have checked some new enterprises, and that uncertainty as to which corporation may be attacked next under the Sherman law has caused anxiety among investors. Furthermore, no one can foresee whether the companies, which are now being dissolved, will be able to maintain their earning power under the altered conditions. Nevertheless, it must be honestly doubted if the Government, or the most radical State legislatures, are actually hurting values nearly as seriously as the crop of laws reducing passenger and freight rates did in 1905 and 1906. In those years prices rose vigorously, not because the harmful effects of such legislation were not appreciated, but because other factors outweighed them.

Similarly when confronted with war scares, or an actual outbreak of hostilities, the stock market may suffer a temporary decline, but, if financial conditions are sound, a recovery ensues. Precisely this occurred in 1898, at the time of the war with Spain; again in 1899, the beginning of the Boer war; and finally in 1904, when the Russian-Japanese conflict began. The crumbling mar-

kets of 1911 must be explained by something still deeper.

The decisions of the Interstate Commerce Commission, denying the general petition of the railways for increased freight rates, and subsequent decisions, such as the Spokane case and many others, making substantial reductions, are also cited as reasons for the decline. Events are proving that the railway industry is not as prosperous as the Commerce Commission believed last February. The railways probably do need higher rates, but if their denial will enable the companies to resist demands for higher wages, the decisions can be dismissed as a potent "bearish" factor.

The railways are retrenching in every direction. On July 1, 1910, the American Locomotive Company had unfilled orders exceeding $17,500,000. On July 1, 1911, the unfilled orders were barely $6,000,000. The same situation confronts practically every railway equipment company. An impairment of the purchasing power of the railway industry does cause widespread depression, but the surest way of restoring its purchasing power is by a reduction of operating cost, not thru subsidies in the form of higher rates.

High operating costs are accepted by many as the secret of the market's decline. It seems probable, however, that a still deeper cause can be found. At the same time it is worth while considering the results of high cost of operation. Business men do not complain about the volume of business. They do complain about the small margin of profit. The exports of the United States for the first eight months of this year reach unprecedentedly high figures; the imports have but once been exceeded. The total trade, amounting to $2,267,500,000, does not indicate business prostration. Similarly the *gross* earnings of the railways leave little to be desired.

A concrete illustration is furnished by the United States Steel Corporation. This company produced 10,700,000 tons of steel for sale in 1910 and its net earnings were $141,000,000. In 1911, its production is estimated at 10,300,000 tons, a decrease of only 3.8 per cent., while net earnings are estimated at $110,000,000, a decrease of 28 per cent. In 1907, with a production of finished steel only 265,000 tons in excess of the estimate for this year, the Steel Corporation had net earnings of $161,000,000.

The accompanying table will show the falling prices of steel products and the rising scale of the average wages paid. The steel prices are an average of eight leading commodities, namely, rails, ship plates, wire nails, steel bars, beams, tin plate, Bessemer iron and steel billets.*

| Year. | Average steel prices. | Average wages. |
|---|---|---|
| 1902 | $39.96 | $717 |
| 1903 | 39.54 | 720 |
| 1904 | 34.89 | 677 |
| 1905 | 36.64 | 711 |
| 1906 | 39.29 | 729 |
| 1907 | 40.63 | 765 |
| 1908 | 38.17 | 729 |
| 1909 | 35.24 | 776 |
| 1910 | 36.11 | 800 |
| 1911 (Sept. 20) | 33.25 | 800 (estimated) |

The United States Steel Corporation is paying each employee $35 more than in 1907, and is selling its products $7 a ton cheaper.

The position of the railways is analogous. The Bureau of Railway News and Statistics says in its report that the year 1910 shows "the largest labor and compensation totals in the history of American railways, absolutely and relatively to miles of line. Not only so, but notwithstanding the employment of a quarter of a million more, and therefore inexperienced men, the average compensation per day was 5 cents higher than last year and 9 cents higher than in 1907. Nine cents a day does not sound as startling as $1,000,000 a day; but applied to the 495,000,000 and odd days worked by railway employees in 1910, it cost the railways of the United States nearly $45,000,000, without adding the revolution of a wheel to their efficiency."

Labor received 42 cents out of every dollar earned by the railroads in 1910, compared with 40 cents in 1906. During the same period the average rate per passenger per mile fell from 2.01 cents to 1.98 cents, and the average rate per ton per mile from .766 cents to .752 cents.†

These facts account for the reduction of the New York Central's dividend from 6 per cent. to 5 per cent. in the

*Wall street Journal, September 18, 1911.
†Poor's Manual, 1911.

face of the largest gross earnings in its history.

The obvious solution of the difficulty lies in the reduction of wages. After the panic of 1907, liquidation of labor did not take place. The steel manufacturers are now considering reductions running from 10 per cent. to 25 per cent. The railways, unable to lower wages, are employing fewer men. Until this readjustment is general, the country cannot be said to be on a firm economic basis.

This condition of affairs is unquestionably serious, but there is another phase of the financial situation which underlies all those hitherto considered. This is the exhaustion of the liquid capital supplies of the world. Every nation has been plunging into debt on an unparalleled scale in the past few years. Liquid capital of all sorts has been converted into fixed capital, as railways, factories, etc., and the securities which represent such wealth have been offered to the public for sale. Of the money so borrowed fully fifty per cent. is spent in the form of wages, in part directly and in part thru the purchase of materials in which cost wages for labor enter. Both labor and capital are worked harder and the cost of each rises. We have considered the rising cost of labor. The cost of fresh capital, as computed by competent authority from the basis of bond sales, has risen proportionally.

| | Per cent. | | Per cent. |
|---|---|---|---|
| 1900 | 3.86 | 1909 | 5.03 |
| 1905 | 4.04 | 1910 | 5.00 |
| 1907 | 4.53 | 1911 | 5.24 |

In 1908, owing to the severe business depression, the cost of capital reacted to 4.15 per cent. Since that time the rise has been very abrupt.

The explanation is not far to seek. Early in 1907 one of the most eminent European economists, M. Paul Leroy-Beaulieu, made this interesting prophecy:

"The growing industrial states, particularly the new countries, are at this moment demanding more capital than the whole world has accumulated recently, or is accumulating today. The civilized world, so far as it can be reckoned up, provides $2,400,000,000 in available capital annually for investment in securities; it is asked in 1906 to provide $3,250,000,000; there was demand, in America at any rate, for even more than its part of the above estimate to be provided during 1907. But the world has not got it; therefore it cannot provide it. Add to this the effect of such catastrophies as the San Francisco and Valparaiso earthquakes, which cost something like $200,000,000, and you will have a perfectly clear explanation of the existing crisis, the rise in the interest rate and the fall of investment securities. The truth is, nations, quite as well as individuals, have reached the point where they must limit their undertakings to the possibilities of the case; that will be done, if not willingly, then by force of events."*

As every one knows now, it was by force of events that the situation was remedied in 1907.

Accepting M. Leroy-Beaulieu's estimate of $2,400,000,000 available for investment, it will be interesting to see if the world has conformed to "the possibilities of the case." According to *Le Moniteur des Intérêts Materiels* (Brussels) the demands of the world for new capital, which were $3,250,000,000 in 1906, have been:

| | |
|---|---|
| 1907 | $3,023,000,000 |
| 1908 | 4,169,000,000 |
| 1909 | 4,424,000,000 |
| 1910 | 4,581,000,000 |

The figures of the entire world for 1911 to date are not obtainable, but in this country, the demands in eight months were $1,410,000,000 as against $1,172,000,000 for the eight months of 1910. In England, however, up to July 1st, there was a decrease of approximately $175,000,000. It is an interesting, but perhaps unimportant, coincidence that the English market, notwithstanding the drop of over five points in Consols since January, and the general railway strike, has been much stronger than the American.

The responsibility for these excessive demands for capital is not confined by any means to business corporations. The national debts of the world are nearly $40,000,000,000, an increase of $10,000,000,000 in ten years.†

There are only four reservoirs of capital in the modern world, the countries of England, France, Belgium and Holland. The rest of the nations find need at home for all their annual savings. The annual contribution of the United States to the capital supplies of the world is figured in the neighborhood of $800,000,-

*Economiste Francais* quoted in A. D. Noyes's "Forty Years of American Finance."

†Cf. *Wall Street Journal*, July 25, 1911.

000. How extensively we have drawn upon the European reservoirs is apparent in the subjoined table:

ISSUES OF SECURITIES FOR FRESH CAPITAL IN THE UNITED STATES.

| | |
|---|---|
| 1907 | $1,394,000,000 |
| 1908 | 1,423,000,000 |
| 1909 | 1,682,000,000 |
| 1910 | 1,518,000,000 |
| 1911 | 1,600,000,000 (est.) |

Inasmuch as this year's requisitions up to September 1, as already given, were $1,410,000,000, the estimate for 1911 is, if anything, too conservative.

We have already seen the result of this condition reflected in a sharply rising interest rate. We have yet to see the second consequence—the postponement of many enterprises—but such a consequence seems inevitable. If politicians with radical measures have indeed intimidated capital and held it back from new ventures, it appears that the politicians are better friends of business than they realize.

This is a new country and needs much capital expended upon it, but it cannot be finished in a day. Among municipalities the tendency to extravagant expenditure results in an increasing tax rate and decreasing credit. This cannot be wondered at when one realizes that the bonded debt of the cities of the United States jumped 100 per cent. between 1902 and 1910, from $1,285,000,000 to $2,565,000,000. A great deal of this expenditure, and the expenditures of counties and states as well, has been used for those things, for whose use the community cannot charge a remunerative price. In the opinion of one of the most eminent economists of this country, President Hadley, issuing bonds for such work is a grave error. He says: "Sewers, harbor improvements, highways and other things which cannot pay for themselves commercially should in general be paid for by assessment, or not built at all. This may seem a hard rule; in some cases it really is. But the enormous number of mistakes made in borrowing money for things which can not and do not pay for themselves shows how unsafe it is for government authorities to judge whether public necessity of such enterprises warrants putting heavy burdens on the future taxpayer."

There can be no doubt that the tremendous capital expenditures of the last few years will find ample warrant in public necessity. On the other hand, for some time to come, the excessive conversion of liquid into fixt capital must cease. The reservoirs of capital must be allowed opportunity to refill. Falling prices are the response of markets of every kind to overproduction. An overproduction of securities necessarily drives down the price level. A period of public and private economy, a disposition among business men to limit their undertakings, the utmost care in the use of capital, accompanied probably by quiet trade, will set us again on the road to prosperity. The remedy is therefore very simple and is found in what Lord Beaconsfield called "the alchemy of patience."

NEW YORK CITY.

# Grief and the Stranger

BY EDITH M. THOMAS

Oh, go not to the stranger with thy mirth,
For at thy jest, thy joy, he is not stirred;
Not wider severed is his country-earth—
Thy joy and his—they have no common word.

Then, go not to the stranger with thy joys;
But go, if sudden sorrow lays its stress,
For Grief each where a kindred tongue employs,
And often may a stranger's counsel bless.

WEST NEW BRIGHTON, STATEN ISLAND, N. Y.

# Dr. Inazo Nitobe

BY KOKICHI MIDZUNO

CONSUL GENERAL OF JAPAN AT NEW YORK

THE United States and Japan are to be congratulated on an arrangement by which hereafter every year there is to be an exchange of distinguished men of affairs between the two countries. The Japanese Government nominates the Japanese exchange lecturer and he is received by Brown University, Columbia, Johns Hopkins, Virginia, Illinois and Minnesota, while in the alternate year these six great American Universities select some prominent American—not necessarily from among their number—to go to Japan.

The exchange begins this fall by Japan's sending to America her most illustrious educator, the idol of all Japanese students.

Dr. Nitobe is to lecture on "Japan and Her Problems" at six universities, each receiving six lectures. Thus nine months are to be devoted to the popular education of Americans on things Japanese.

Let us now study the man who will initiate the task, the task that only can be accomplished by a scholar of deep learning with a high standing and a tact of diplomat, to say nothing of the full knowledge of the language, customs and psychology of the people whom he has to deal with. If a man fit for this mission has to be found in Japan, Dr. Nitobe is the one, for he has all qualities just mentioned combined. The students of philosophy, religion and ethics must undoubtedly be familiar with the deep learning of the author of the "Bushido," the soul of Japan, which is now translated into more than a dozen languages.

Dr. Inazo Nitobe was born, second son, in a remote part of City of Morioka called "Sembougi," in 1862. His father, a retainer and Vice-Chancellor of Lord Nambu, was an accomplished Samurai and owing to his valuable services in planning irrigation and opening up of villages under Lord Nambu, he and his family were granted an audience by the Emperor on the latter's visit to Morioka in 1876. The father, however, died when little Inazo was four years old, leaving the children in the care of his wife, who proved a worthy woman and mother. Little Inazo began his study of Chinese classic called "Shisho" in his seventh year, besides the Samurai training. As foreign intercourse came into existence, he, soon foreseeing an urgent necessity for Western learning, came to Tokyo with his brother. His uncle, Ota by name, adopted the lad as his son and sent him to a school called "Meiji Kyoko" at Tsukiji for English lessons. Soon he entered "Kyokwan Gijuku," meaning "Mutual Custom Dormitory," established by Lord Nambu. He did well in the school as in the other. One day when the lad returned home overwhelmingly rejoiced over the prize book he had won at an examination, he was severely censured by his uncle, who deemed it unworthy of his boy to be so easily satisfied at a trifling honor. Ashamed as he was, it gave him a strong stimulant for a greater goal in life and never since has the boy striven for trifles. As is properly mentioned in his dedication of the "Bushido" to his beloved uncle, the well-trained personality

of Dr. Nitobe must more or less be due to the discipline of his worthy uncle. A little later he entered the School of Foreign Languages, preparatory school for Imperial University, and took the English course, distinguishing himself at the head of his class. By the time of graduation, young Nitobe mastered the English language to the extent that he was able to compose fine verses or prose at will.

At this time most youths were inspired by the study of laws in preparation for government offices, but when he listened to a patriotic speech by a certain T. Nishimura, who declared that Japan's need at present is to "study and develop the industries," young Nitobe took this wise advice to his heart and resolved to study "agricultural problems." He, at the same time, saw it necessary to combine it with the knowledge of political economy, Chinese classics, law and literature as well. With this object in view, he soon entered the Sapporo Agricultural College, which was established and conducted by an American professor. He

DR. INAZO NITOBE

graduated from the college in 1881 with high honor. During his study in the college he showed an inclination to the liking of literature, political economy and Christianity, which was adopted by him as his belief by becoming a member of the Independent Church of Sapporo.

Influenced by the American atmosphere of Sapporo, he was inspired to see the real America as the place of his higher study.

In 1883 Nitobe crossed the Pacific and journeyed thru the American continent to be enrolled in the Johns Hopkins University of Baltimore. Here he studied agriculture, economy and political history for three years, winning the degree of A. B., then rarely obtained by Japanese students. Immediately after his graduation from the Johns Hopkins, he proceeded to Germany, and during the next three years he studied philosophy and political science at the universities of Bonn, Berlin and Halle. At the last-named university he received degrees of A. M. and Ph. D. On his way back to Japan, Dr. Nitobe came to this country, and was married to Miss Mary P. Elkinson, of Philadelphia, in 1890. They became engaged while both of them were studying at Johns Hopkins University. Miss Elkinson's parents, Quakers by faith, were strongly opposed to the match, but the devotion of the two was so true and strong that nothing could prevent the plan, and today no happier life can possibly be enjoyed by any set of married couples here or abroad.

On his return to Japan from abroad, Dr. Nitobe was appointed professor of agriculture and political economy at the Sapporo Agricultural College, where he became a prominent figure and won such popularity among his fellow professors and students that they all labored to keep him in the chair when he was appointed to a Formosan government office several years afterward.

During his tenure of office at Sapporo and Formosa, he wrote the famous "Bushido," which was published in Philadelphia in 1898, and several other books on agricultural sociology and colonization, each making an unparalleled success in popularity as well as otherwise.

In Formosa he served as the director

of the Bureau of Productive Industries, and his services were so valuable and indispensable that he had soon won the full confidence of Baron Goto, then Civil Governor of Formosa. The credit won by Formosa as one of the most successful colonies in the world's history should partly be attributed to the genius and labor of the man we are now studying.

In 1904 Dr. Nitobe was appointed professor of political economy and lecturer on colonization at the Imperial University of Kyoto. Soon he became known among the students as an ideal professor and adviser, and his popularity was so great and compelling that the Government found it wise to have him at the head of the nation's first college in the Imperial capital, which needed as strong and popular a president as any Imperial university could have. He now holds the chair on the policy of colonization at the Imperial University of Tokyo.

He is today not only the president of the first college, but is a tender father and wise adviser to Japanese youth of all classes, including students of all grades, office clerks, store boys, and even grown-up people. He is perhaps the busiest man in Japan. When he is up at six o'clock in the morning, several youths are waiting in a drawing room, no matter how stormy or rainy a day it may be, seeking an interview, and it is not unusual for him to receive half a hundred people before he leaves for his day's work in the college at nine o'clock. Besides this, as many and perhaps more than this number of letters are daily pouring into his desk, and most of them seeking his assistance in securing positions or advice as to how to relieve themselves of material as well as mental troubles. The cases vary just as much as the people seeking his assistance vary. Some of them want to get a place in his family as schoolboys, while others ask his advice as to what books to read on philosophy, economics or colonization, and still others tell their love affairs that disheartened them to the point of self-destruction, or the business troubles that bankrupted them. Furthermore, many friends come from foreign countries to see the author of the "Bushido," to say nothing of the letters from foreign countries asking his autograph and views on different subjects.

The present writer once heard him say that the hardest thing to bear is "inability" to give full and quiet advice to those seeking quick relief from the mental collapse often threatened by sad ending of life. Even with such a busy life, he tries to respond to all. This tender spirit on his part is the real value of his personality, which wins him ever-growing popularity day after day.

It is no exaggeration to say that he is the "idol" of Japanese youth. An example may be set here: A few years ago, when the younger brothers of Prince Shimadgu were asked what was their desire in their future education, they all answered: "We want to receive personal discipline and instruction from Dr. Nitobe, whom we regard the greatest educator of modern Japan." So an arrangement was made to have the three younger brothers of Prince Shimadgu under the private tutorship of their "idol," with whom the young barons are still living.

In the vacations of summer and winter he is asked to deliver lectures or make speeches at the grammar schools, high schools, colleges, and many other organizations in remote parts of Japan. Such applications are so numerous that the engagements have to be made a year or more ahead. Not satisfied with his personal speeches and lectures, the Japanese public demand his writing or interviews in magazines or newspapers, so much so that no magazine without his name on it is a good seller.

Dr. Nitobe is of a very simple nature, with no other personal pleasure than reading. He is perhaps more fond of reading than of food, for he once confest to that effect. All his savings are spent for new books, and nothing pleases him more than to find a few minutes to drop in the Maruzen or Nakanishi book stores of Tokyo, inquiring after new publications. He reads English, German and French, as well as Chinese, and is a past master of the English language, as is evidenced in his well written "Bushido."

Deprived of leisure hours at home and abroad, he enjoys train traveling, during which he can sit quiet and get a "bite"

of mental food without worry and distraction. Whenever he travels on a lecturing tour, he keeps himself incognito, and never mentions the time of his departure or arrival, lest he might receive welcome ovations along the road and on his arrival, but is always found on the platform at the appointed place and time.

In spite of their social standing, Mr. and Mrs. Nitobe dispense with social functions, for the simple reason of "physical imposibility" under the circumstances. They live in a cosy Japanese home, furnished partly foreign, in a remote part of Koishigawa, Tokyo, near residences of Marquis Komura and Baron Sakatani. The house is surrounded by a beautiful garden in the front and a roomy yard in the back, the environment being shady woods of evergreen and primeval trees. The entire effect is very quiet and poetical. The rattling sound of bamboo trees in the autumnal breeze, the musical note of the nightingale in the spring and the cuckoo's lonely song, or the dog's barking in the remote distance thru the quiet wood in the moonlight night is the kind of life this modest author-educator-statesman and his American wife enjoy.

Tho the author of "Bushido," literally translated "Knightly Way of Samurai," he is a poet and a lover of "peace," for the attainment of which he has written the book. He tells the spirit of "honorable dealing," which should be the basis of modern civilization.

"Bushido" applied to commerce, to diplomacy and to friendship would make of this world a "peaceful one." The writer hopes that thru him the American public may learn something of Japan and her people, and that thru an able American the Japanese public may learn the real intentions and conditions of the United States and her people.

In concluding this article, the writer may add that Dr. Nitobe has the honor of having two Japanese doctorate degrees—"Nagakuhakushi," Doctor of Agricultural Science, and "Hogakuhakushi," Doctor of Laws, besides his A. B., A. M. and Ph. D. degrees, secured in this country and Germany. This honor is rarely conferred in Japan, and the holders of two "Hakushis" can perhaps be counted on five fingers, one of which is claimed by Dr. J. Takamine, of New York.

New York City.

# Under the Harvest Moon

BY E. P. POWELL

THERE are two months so much alike that only from courtesy to the moon we might call them one. But the moon has a queer way about this time of snuggling down close to the earth, as if she felt that she must see to it that the work of the year was thoroly finished and the harvests all safely garnished; and so we call it the harvest moon. September and October might at least have had names, but as it is they are only numbered; and for that matter they are numbered wrongly, for they are not the seventh and eighth, but the ninth and tenth months of the year. Well, the harvest moon does not care for that, so long as the corn is ripened before the frost, and everything wound up right; only just ahead a frost may catch us any day, and then we have only a black garden to show for our work.

The atmosphere is very yellow all night, a soft, clear, warm yellow, that makes the red apples and the purple plums wonderfully inviting; and for that matter the leaves also are yellow. Last night I declined supper, giving no reason for it, for I wished to eat a Sherwood's Favorite and half a dozen Peter's Yellow Gages, down in the garden, all alone, under the grape vines and the apple trees—with the night folk; and I did it. One ought not to let half the world go by while he is asleep, and never get

acquainted with the folk that run it. I had in my pocket, besides a slice of old-fashioned gingerbread, two cookies, and these I had so that I could leave plenty of crumbs for my table mates. I had only to reach up my hand to get big bunches of Massasoit grapes, which hung all about me; only it must be done very quietly so as not to disturb the orchestra. One changes all his companions in this way for a while, and gets acquainted with another sort of people. There were no chickens or bees abroad, and even my collies were in their kennels. Treetoads were conversing in the trees, and warted toads crawled out from everywhere, hopping about my feet.

The colors of such a night are all different from the day; the sounds are different, and the smells are different. You know there are flowers that give no odor in the daytime, but at night they call loudly with their sweetness for the moths. The moths not only feed on the nectar, but they carry the pollen about and so pollenize the plant. Other plants are demure at night, emitting no odor, or very little of it, for they will wait for the daylight and the butterflies. How marvelously things fit together! No wonder the Prophets thought that the world was made out of hand; only they need not have said it was made from nothing. I think that most of the ripening goes on after sunset, just as most of the growth goes on just before and after sunrise.

Night, as a rule, calls us away from the earth, bids us look up at the stars and think of eternity; it breeds poems and piety. But these harvest moon nights are not only very sweet but they are very earthy. They fill our senses and our minds with worldly thoughts. The smell is very strong of cornstalks, of apples and of aftermath. The phloxes up in the garden reach out after the wild asters down by the creek. The moon does not get out of our atmosphere, riding low, as they say; and the stars do not twinkle. We ourselves grow more rather than less worldly. This is our harvest and our harvest moon, and this world is our own dear home. There could hardly be a better.

I do not feel quite at home with these fellows of the moonlight, but it is good for me to find out something about all my neighbors. I want to know how the world is made up. I am interested in the swallows that glide just above the trees, in great curves, while the night hawks utter little cries of gladness—for they love the chase in the air as well as hounds love it on the ground. The sharp day notes of the cicada have changed to the chiming of the crickets, the katydids and some other beastie that I do not know. It is marvelous music with which they fill all the air, and I think the millions engaged in it enjoy it as much as I do. How happens it that this multitude of sounds all together makes melody and not discord? Think of the delight that music gives to ourselves; then think of the unnamable millions of happy musicians in the field and the air, in the trees and the bushes, piping love and joy all night.

But there is yet a crowd of affairs, so that Nature does not give up even the nights to pleasure, but works with full steam on. There are the apples to sweeten; the corn to glaze; the aftermath to lengthen and the seeds to ripen. What if one could get a glimpse of all that is going on among the millions of looms? Try to imagine what is wrought in a single hour, within the compass of our senses. Every leaf is changed and every twig is lengthened. You must try to understand this tremendous activity, for are not you and I the gardeners, to oversee and direct? At least, we imagine that we are. To be a farmer, and compel all life to tally for human welfare, that is our delightful place in Nature.

All this while there has been a queer tumbling over and about me of little winds; coming by caps full and by hands full, and sometimes big puffs, light, but strong, tossing about me all sorts of picked up odors, and bits of sounds. There is nothing so mysterious as an autumn wind. It comes out of the garden, or it jumps out of the orchard; has no unity; and seems to have no definite purpose. It passes by us in long laughs or in deep sighs, or just touches our cheeks and whispers a fancy in our ears. It is a vocalization of Nature in a hurry. Our old housekeeper feels that she has

more to do than she can make sure of, and, like some other housekeepers that I know, stirs up a breeze about it. Half a dozen apples are jerked off and left to roll down into the fence corners; a twist of leaves is pulled up into the sky, and scattered with a don't care hand. What do the winds say, and where do they go? I know no more about it than where they come from, for, tho they never quite die out, they always are dying, rising, falling, swelling, rolling and whispering.

I like the smell of night. Contrary to the common notion it is full of health as it is of sweetness. If you have a lot of diseased trees that is another thing; it turns your garden into a hospital, and I do not care for it either by night or day. It is a severe tax to see sickness, or hear the story of symptoms. Speak only of strength, of beauty, of life and achievement. Health alone is wealth; without it nothing is worth while. I like the creed of the Boy Scouts; a scout smiles and looks pleasant. One should have nothing about his garden any more than about his house that is not sweet and wholesome. It is only true that night gives a little better chance for decaying rubbish to taint the atmosphere. Night, just as much as the day time, loves life.

The village clock strikes ten, and for a moment it disturbs the vibrations of the wild music; only a moment, however, and the simple folk are at it again. Then the trolley, a full mile away, slides around its iron curve in the village, and that also breaks into the concord. The rude noises of automobiles occasionally strike in from the distant highways, as yet an unfinished free lance of locomotion. Some day it will be a completed machine, and fit better into the music as well as the economies of the farm folk. We shall also get rid of the iron rails and the trolley wires, and the affairs of the daytime and of the human kind will have nothing that will disturb the harmonies of night.

The orchestral effect is most wonderful. The katydids and the tree crickets can hardly be differentiated. The result is precisely that of negro melodies; there are no harmonies, only one vast swinging final melody. You cannot afford to lose these magnificent expositions, so I advise you to take at least one night, or a part of it, out of doors under the harvest moon. The climacteric effect is soon after dark; and this gradually softens, as the night wears away, into a choral rondo that lasts until daybreak.

The clock strikes eleven. The moon is just now at its highest, and looks down thru every opening into the garden, and what it is doing under the raspberry bushes and the plum trees I do not know —that is, I do not know all of it; but the witchery of the play of light and shade is something beyond my power to describe. Best of all, I think, is this dancing of the moonlight thru the leaves. I will walk by the brook and hear its night talk, and will then go into the lonesomeness of the house, and to sleep. It is strange what habits human beings have adopted, and not one is more curious than this shutting of ourselves indoors, with a fear of the dew, and of the moon, and of night air, and of all other most beautiful and sweet things.

As I go by the barn my horse whinnies low and cordially, and seems to say, "It is no wonder you are out and about tonight, for it is pleasanter than the daytime. I would like to roll out there, under the harvest moon." Yes, yes, and why not? The cows are lying, chock full of supper and peace, in the pasture, and every one of them facing the harvest moon. Then, by the hedgerow, my catbird whistles to me, very softly and very lovingly. I have waked him from his sleep, but it is no matter, for he is a light sleeper, and frequently hums over a tune at midnight. You know already what I think of the catbird; it is a friend above all other birds.

If you will only look out for it you will find a lot of good will in this world. Bird life is a poem, but since the first of August, when their nestlings flew, they will not sing. I wonder why home life makes the bird so joyous, for it must work incessantly—but it sings also quite as unceasingly. Do they not have the real secret of a happy life, that is, to glorify work? I do not wonder that an empty nest puts an end to song. My robins had a habit lately of collecting, on

or alarm call, under the lindens by my bees. I have been unable to find the cause of their disturbance, but suspected an owl. Tonight I came suddenly upon him, eating a supper of mouse. He sits with his back to me on the barn gate. Without moving his body, he rolls his head square about, and looks at me with his monkey face and his big round eyes. It is an impudent stare, for he considers me evidently as a day bird, with no mission or rights whatever out of doors after dark.

The days have grown shorter. The sun is not up till six o'clock; and a good deal of the verve is out of daily life. One can lie a little longer in bed patiently; a thing, however, that I detest. Sleep is respectable, but inanition is irrational. There are two kinds of old age, one that comes on with the lapse of years—after the big jobs are done and the sithes are hung in the sheds; the other is the wearing out and irrecoverable sort of oldness, where one loses snap, and has no legs with which to go blackberrying.

Yesterday my boys and I went over the hills, into the big glen, for berries, and we came home with baskets full. It is just as much fun as ever; only be sure to put on old corduroy trousers, or you will come home without any at all. My collies went with us, and had a dozen skirmishes—all hid in the dense bushes, but if one be used to it he can tell by the bark whether it is a rabbit, or a squirrel, or a woodchuck. I do not say that I would like to take such a tramp every day, but I do say that I care less for Golden Streets than for Kirkland's Glen; and I hope always to have a boy's taste and elasticity for going berrying.

At noontide there was a perceptible smell of cooking. The thermometer stood at 95, and in the cornfields it hardly needed a bonfire to roast the ears. Boys escaped the heat under the big willows, where the goldenrods glow, altho they had but three feet of water to lie down in. The brook went bounding over them with a joyous laugh. Always make the best of what you have, boys. Today again the thermometer climbs up to 90 at noonday, and again nothing is more natural than a few ears of corn roasted over some bits of old rails, kindled in the orchard; after which it is nice to lie down on a mossy knoll under the big hemlocks. All day down the valley corn wagons start out from the barns rattling, or return with their loads more quietly.

I saw the first goldfinch in August. It is a charming bird, the most golden thing in the most golden month, swinging on a thistle while it pulls out the seeds. I always leave my tall larkspurs in the garden, and the columbines, after they have turned brown in the summer, because the goldfinches, I know, will like to gather seeds from them. It is a fearless bird, and always joyous. A dozen of them will gather in the same pasture corner, and they carry on continuous conversation in soft, innocent notes.

It is wonderful to know how much more skill and care are expended on the autumn nests. These goldfinches are building just now, and they know that cold winds are ahead. Nothing could be more careless than a robin's home, set down almost anywhere, and plastered with mud; unless it be a catbird's nest, made up of sticks and no plaster at all. With the goldfinches comes about a better sort of bird architecture, and they build charming little houses, thatched all over with mosses and lined with thistledown. An English sparrow is a pure savage, crawling into any filthy hole to lay its eggs and breed its young. Thrushes belong somewhere in the shepherd era of bird history; but these September finches are of the horticultural era. They even adorn their nests with beautiful bits of lichen, gleaned here and there from the logs and rocks.

September and October are specially rich in weeds, and weeds are rich in color. The poke is full of its purple berries, and overhead the ash trees are purpling. The real glory of autumn is the plants that we despise; those that we plow out and hoe out if we can, and hold them hardly worthy of names. I suppose there is not one of them without its specific value, which we shall some time find out. We begin by making medicines of them, but after a while most of them turn out to be food for man or beast. They constitute more than half of the vegetation of our fields and gardens, and are a great undiscovered territory. For the present they are con-

tent to plow our soil with their roots, shade it with their foliage, and cover it for winter. Then we make most of our humus and soil, at least the best of it, by plowing under this despised stuff. Do not burn them or let them dry up. Pull them or cut them, and pile them in compost heaps until decomposed. This gospel of the weeds must be preached.

The year is dying, but grandly. Looked at rightly, the years are great cycles of life. You feed your plants; in turn they feed yourself and your animals; then both feed the soil. The soil takes up the cycle to repeat it for nobler issues. So go the years, and we count our harvest moons to three score and ten. Is there anything that escapes this round of the year? I am sure that there is, for in my soul there is something not made of nitrates and phosphates. If we could only put things together, instead of seeing little bits, I think we should see in all things Him in whom we live and move and have our being.

SORRENTO, FLA.

# The Labor Unrest in Great Britain

BY SYDNEY BROOKS

ENGLAND is still discussing the causes and character of that great outbreak of industrial discontent which threatened a few weeks ago to strangle her commerce and manufactures and cut off her food supplies. And the crisis had so many aspects and was in every way a phenomenon of such momentous significance that it can hardly be inquired into or pondered too much. I speak of it in the past tense, but one has only to pick up an English newspaper to see that even if the worst of the earthquake is over, its tremors and rumblings still continue. The words "Labor Unrest," "Labor Discontent," "Labor in Revolt" stare at one from the headlines of all the journals; many strikes are in progress, many more are threatened; the acute stage of the convulsion of last August is past, but the process of subsidence, it is very clear, will be tortuous, protracted and far from tranquil.

And yet it is somewhat oddly ironical that in Great Britain of all countries and at the present of all times there should be this sudden and pervasive outburst of labor unrest. Within the past five years more Acts of Parliament have been conceived and passed in the interests of the working classes than in any previous half century of British history. Labor has secured a powerful and presumably authoritative representation in the House of Commons, and its grievances and demands were never more assiduously attended to. The "social question" has stepped into the forefront of British politics and engages the legislative mind to an extent that sometimes causes other and not less vital questions—questions, for instance, of national defense and security—to be treated with anything but adequacy. There never was a time, I suppose, when "the condition of the people" received more skilled or more anxious thought, when the reforming, philanthropic spirit was more clearly in the ascendent; when the industrial evils were more firmly grappled with; or when the will of the country was more resolutely set upon redressing injustices and inequalities. Glance thru the British Statute Book since 1906 and you will find it crowded with measures adopted for the benefit of labor and the poor—measures conferring old-age pensions, relieving trade unions of their liability to be sued for damages by employers, greatly extending the scope of the Workmen's Compensation Act, enforcing a minimum rate of wages in certain of the most sweated trades, establishing labor exchanges all over the country, bringing into operation a vast scheme of national insurance against sickness and unemployment, and so on. And with all

this there has gone on a seemingly progressive development of the idea that strikes and lock-outs are relics of a barbarous and outworn past, and short industrial disputes should be settled by arbitration. There have been many critical collisions between employers and employed in Great Britain during the past few years, but not one of them resulted in a really formidable strike. One by one they were settled by a resort to the official and unofficial machinery of conciliation, until many Englishmen had almost persuaded themselves that industrial warfare of the old type had been put an end to.

The events of August undeceived them, but left them for that very reason more than ever bewildered. The assumptions and foundations on which they had been studiously building seemed to vanish in a flash. Had all the well-meant, well-directed and untiring efforts of Parliament to benefit the working classes gone for nothing? Has labor jumped abruptly to the conclusion that, while arbitration and friendly settlements are good, in that they avert the distress that goes with unemployment, they still bring in no positive gains to the working classes, add little or nothing to their incomes, diminish scarcely at all their hours of toil, and in no tangible and ponderable way alleviate their lot? Is there a mood of restlessness and impatience coming on, a mood in which the excitement and tension of a big strike seem preferable, with all its risks and hardships, to the smooth, deadly grinding of the industrial mill that produces so little grist to the workers themselves? Has labor become infected with the propaganda of Socialism or with the idea, more familiar to France than to England, that "the general strike" is the handiest and most effective weapon of social betterment and that all Parliamentary agitation is so much waste of time? Is England now facing one of the inconveniences of the revolution that began when she instituted a national system of education? Has Democracy at last arrived with the determination to convert electoral power into higher wages, better houses, more food and greater leisure? Or is the cause of the unrest primarily economic and due to the discovery that while wages have risen and hours of labor have decreased during the past two decades, the price of the necessaries of life has risen out of all proportion?

All these and many other aspects of the recent and present disturbances in the industrial world are being keenly canvassed. But there is one feature connected with them that seems to me of peculiar significance. Time and again within the last few years, but especially in the troubles of August, we have seen what can only be described as a revolt of the working men against their own trade union officials. We have seen strikes initiated against the advice of the men's recognized and freely chosen leaders; we have seen terms of settlement arranged by these leaders and then rejected by their followers; we have seen agreements between employers and employed broken by the latter at the shortest notice and in spite of the protests of their appointed officials; we have seen employers placed in the curious position of backing up the trade unions against their own members.

The enormous significance of this will be apparent to any one with the smallest knowledge of the principles, workings and history of trade unionism. In Great Britain trade unions have overcome two powerful enemies. They used to be illegal; they are now, if anything, as much above the law as they were formerly below it; certainly they enjoy some legal privileges such as no other associations can show. And not only have they forced recognition and more than ample safeguards for themselves from Parliament and public opinion, but they have also, after a generation or more of fierce struggle, established themselves in nearly every industry in the country and overcome the employers' prejudice against them. Today in all the principal trades of the country, except the railroad industry, trade unions are "recognized" and the fight for the open shop is over. What is more, British employers of late years have worked round to the conclusion that it is far easier for them to deal with a strong and responsible trade union than with a multitude of individual employees. And trade unions in Great Britain are both strong and responsible. They are managed by cautious and experienced

men; they have amassed very large funds; they are opposed to unnecessary strikes and to violence of all kinds; they are in the main eminently pacific and conservative organizations, with a far stronger inclination toward bargaining with employers than toward fighting them. Time and again, as I have said, we have seen within the past few years disputes in great industries carried to a point where two decades ago a strike would have been inevitable; and we have seen these disputes settled by arbitration or by the intervention of the Board of Trade, or by the establishment of joint committees of employers and employed, or, oftenest of all, by direct negotiations leading to a formal and inclusive treaty of peace between the employers and the trade unions.

But now it seems that the trade unions have still one enemy left to overcome, the most formidable, perhaps, of all, an enemy in their own household—the very men, in other words, on whose behalf they have been called into being. The essence of trade unionism is collective bargaining, is the power to arrange terms with employers to include masses of men and so cover the conditions of an entire industry. But what if the trade unions are unable to enforce those terms upon their own members? For that is precisely what has been happening with increasing frequency in England. We have seen men violating agreements concluded by their own trade union officials, taking the matter into their own hands, going out on strike not only against the advice and entreaties of their leaders, but in defiance of specific pledges given in their name by those leaders. Now it is obvious that collective bargaining is only possible if, when a bargain has been made by the authorized leaders, the whole body of the men will abide by the terms agreed upon. If the leaders are liable to be repudiated by the men on the spur of the moment, trade unionism to some extent collapses and the old state of industrial anarchy and warfare secures a fresh lease of life. It is, in short, vital to trade unionism that it should be able to suppress local and individual and sectional revolts.

But why should such revolts break out? Without going into the details of the industrial disputes that have been disturbing England, I think it possible to point to a few general causes that explain the dissatisfaction of the men with their leaders. In the first place, the men remain individuals, with their interests mainly centered in their own immediate industrial conditions, while the effective trade union organization of today is no longer the local branch, is no longer even the trade union itself, but is the federation composed of all the trade unions that are involved in the same industry. The result is, first, that the rank and file find themselves almost as remote from the leaders of these vast federations as from the employers; secondly, that the process of settling disputes by negotiation between a trade union federation on one side and a federation of employers on the other takes a lot of time and a lot of red tape; and, thirdly, that whatever settlement is reached applies to the whole trade and must therefore often ignore local and minor grievances, local customs and conditions, and the local purchasing power of money. The inaccessibility of the trade-union leaders—they are harder to get at nowadays than a Cabinet Minister—the dilatoriness of the machinery of negotiation, and the ever-ready suspicion that the interests of one locality or of one trade union are being sacrificed to other constituents of the federation, account for a good deal of the spirit of mistrust and indiscipline in the ranks of labor.

Then, again, I question whether the average workingman has yet assimilated the doctrine of industrial peace on which trade union leaders have more and more come to act. The mass of working men see in their trade union a vast fighting organization whose weapon is the strike. It makes them a little suspicious when they find their leaders perpetually arguing against strikes and pleading for a settlement by compromise. The leaders themselves, moreover, and especially those of a Socialist turn of mind and those who are, or shortly hope to be, in Parliament, undoubtedly look upon the trade unions from a standpoint which is not wholly that of the men. They regard them less as industrial organizations than as a well-organized and wealthy machine for securing labor representation in the

House of Commons. Indeed the perversion of British trade unionism from industry to politics has been very marked during the past few years. The Socialists for the time being have pretty well succeeded in capturing it. Although a small minority, they have contrived thru their activity, thru the political apathy of the rank and file and their absorption in the provident and industrial sides of their organizations, to graft themselves upon trade unionism to an extent that goes far beyond the wishes or intentions of the working classes. Nothing was more manifest thruout the industrial ferment of August than that the Labor M. P.'s had not provoked it, could not control it, and were as much surprised by its outbreak as the rest of the country. Altho elected by the trade union vote and maintained by trade union funds, the Labor M. P.'s have gradually lost touch with the currents of working class opinion; and the spectacle of former trade union leaders voting themselves $2,000 a year as members of Parliament and accepting lucrative posts in the government service, has not been calculated to bridge the gulf. The more, indeed, trade unionism has taken to politics, the more steadily has it seemed to lose its hold over those who joined it not for political purposes but to safeguard themselves against sickness and unemployment, and the more indifferent has it appeared to become to those industrial objects which were its original *raison d'être*. Add to all this the bitterness and personal jealousies that run thru all working-class organizations of which I have ever had experience—the scramble for places, the ferment for underground intrigue and dissension, and the rivalries among the leaders—and the broad outlines of the crisis in British trade unionism will become apparent. Recent events have forced the problems of industry upon the notice of Englishmen with an urgency there is no escaping. But among those problems there is perhaps none more vital to industrial peace and stability than that of restoring the authority and principles of trade unionism. Today it is not so much the employers who dispute those principles or resist that authority as the trade unionists themselves.

London, England.

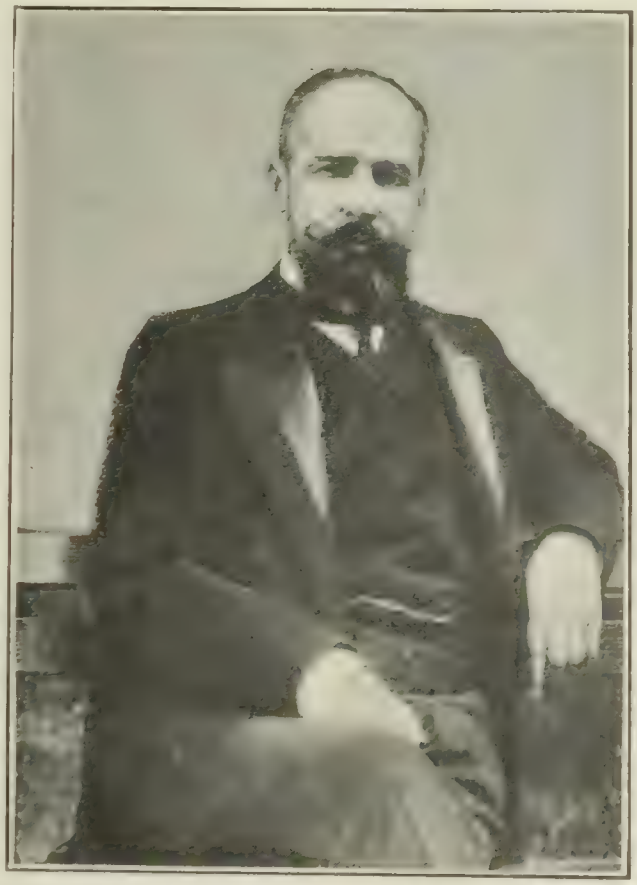
# The Assassination of Stolypin

BY HERMAN BERNSTEIN

LAST May, when I visited St. Petersburg, a prominent Russian, in speaking of Premier Stolypin, said to me:

"Stolypin is like an old coat, whose usefulness is at an end. The old coat is simply worn until a new one is procured. Stolypin has served his purpose, he has done his work of destruction, and, now that he is despised both by the reactionaries and the liberals, now that he is discredited, he will soon be cast aside.

"Stolypin is a dead man. In Russia you may see dead people walking. When the Czar was crowned, during the catastrophe on the Khodinsky Field, dead people were actually walking, carried along by the mob. Stolypin is such a dead man, carried along for a while by the crowd he had pleased, but he will fall soon. He has been used up and he is dead."



In 1908, while I was in Yasnaya Polyana, Leo Tolstoy, who had known the Stolypin family, said to me of Premier Stolypin:

"I feel sory for the man. I cannot condemn him. I rather pity him. His hands are tied and he cannot do anything."

Others, in the foreign press, have described Stolypin as the "Iron Man" of Russia, who restored order out of chaos, who pacified the stormy waves that swept over the Russian land.

As a matter of fact, Premier Stolypin, who was assassinated recently in Kiev, in the presence of the Czar, by Dmitry Bo-

grow, a young lawyer, was a weakling, a tool, a willing performer of the dictates of the Czar. Dazzled by the glitter of the Court and the splendor of office, he sacrificed everything in his efforts to appear powerful. He posed as a liberal abroad and introduced repressions at home that made the régime of Von Plehve mild by comparison. He preached constitutionalism and practised absolutism, and established a reign of terror and anarchy in the Russian Empire. He exercised the "Stolypin necktie" and the scaffold as a means of "pacifying" the people. He dispersed the two first Dumas because they were representative of the people, and broke the Constitution, granted in 1905, by creating special election laws, which made the third Duma a mere Stolypin megaphone. He imprisoned the noblest men in Russia, who were chosen to represent the people in the first Duma.

THE LATE PREMIER P. A. STOLYPIN

Stolypin's strength at Court lay in the fact that he was supposed to be able to handle the Duma at his will. But when he introduced his most reactionary measures last spring, and both the Duma and the Council of the Empire voted against him, he lost his bearings. He had done his destructive work and his usefulness was at an end. He had helped to revoke whatever reforms had been introduced under pressure of the rising waves of discontent thruout the land. He enforced new restrictions against the Jews, he sliced off portions of Finland and turned them into a Russian province, and took from Finland her autonomy.

Assassination and terrorism have but rarely accomplished lasting good. Stolypin died from an assassin's bullet. But it was Stolypin who legalized terrorism in Russia during his régime. Executions have been committed there daily, bringing Russia back to the days of savagery and depraving the people who were harassed and exhausted by innumerable devices of reaction and tyranny. It was Stolypin who defended in the Duma that diabolical *agent provocateur*, Eugene Azeff, who tho connected with the Russian Government, planned and organized the assassinations of Minister of the Interior Plehve and Grand Duke Sergius, the uncle of the Czar.

Constant bloodshed marked the reign of Stolypin, who introduced a system of bribing the European press for the purpose of picturing the "constitutional autocracy" as an ideal state, and the Premier as a liberal. The loans that were thus secured outside of Russia, upon usurious terms, directly helped to maintain this reaction against the interests of the Russian people. A great portion of the moneys loaned to Russia have been expended upon an army that is doing secret police work and upon a fleet that does not exist, upon the maintenance of exclusive laws and armed spies and agents in every village, upon provocateurs and hangmen. Azeff, for instance, was getting $14,000 a year from the Government, and Rachkovsky, the late secret agent of the Russian Government in Paris (who so cruelly avenged Lopukhin, the former Director of the Police Department, now exiled to Siberia for having exposed Azeff), was given a reward of $75,000 for his faithful services as a spy.

Sufficiently strong to crush the uprising in 1905, the reactionary forces have not entirely paralyzed the activity of the discontented elements concealed within the life of the people. Only by wise reforms introduced wisely and in time could the Government have established real order. But instead, Stolypin used brute force and violence, so that even Tolstoy himself, who pitied the weak Premier, was so stirred by the horrible executions thruout Russia that he made an appeal that the hangman should swing a soaped rope about his (Tolstoy's) wrinkled neck and thus save him from seeing all human and divine laws trampled under foot so brutally.

The first full account of the assassination and of the assassin has just arrived here from Russia. The cablegrams have brought numerous conflicting stories about the assassin and the manner in which he secured his card to enter the theater, which was so strongly guarded, since the Emperor was present at the performance. The Russian account throws new light on the man and his deed.

Immediately after the shooting of Stolypin, the assassin was caught in the theater, beaten by some of the people and taken to the refreshment room, where the highest authorities of the police department commenced cross-examining him. He was searched and a card was found on him, bearing the name of Dmitry Grigoryevich Bogrov.

The assassin stated that this was his real name, that he was a lawyer in the city of Kiev, and that he lived with his father, also a prominent lawyer in Kiev.

Bogrov carried himself with dignity and answered all questions with apparent frankness. The cross-examination lasted from 11.30 at night until 6 o'clock in the morning. While answering questions he crossed his arms in Napoleonic fashion, smoked and regarded his questioners with an air of irony.

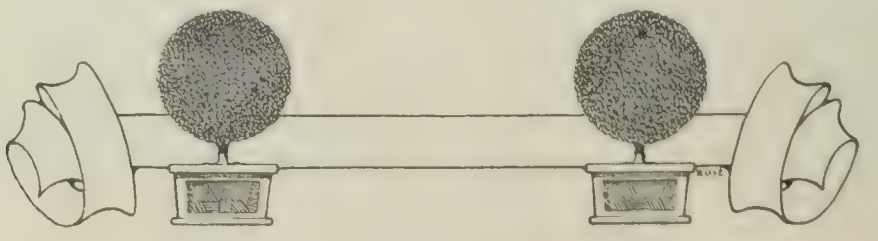
Inspector Byalotsky recognized him, saying: "I remember your face, but I have forgotten where I met you."

"Of course you know me," replied Bogrov. "I was arrested several times."

Then the Inspector recalled that Bogrov had been imprisoned on several occasions during the revolutionary period.

Bogrov related that he had received letters from the revolutionary committee in St. Petersburg, inquiring whether he was still a revolutionist and whether he was still faithful to the organization. Bogrov replied that he was still faithful. Then he was invited to St. Petersburg. On August 31, 1911, Bogrov went to St. Petersburg, where he was entrusted with the mission of committing a terroristic act against the Premier. Bogrov undertook to carry out his mission and returned to Kiev on September 11. When he was asked how he succeeded in getting a permit to enter the theater, he smiled at first, but declined to answer this question.

It is learned that Bogrov, upon his return from St. Petersburg, came to the secret police department in Kiev and informed them that he knew that an attempt on Stolypin's life would be made in the theater during the gala performance, adding that he did not know the whereabouts of the person commissioned to commit the crime, but that he would recognize him at the theater. The police department believed Bogrov and secured for him a pass from the mayor of Kiev.



The prosecutor, among other questions, asked Bogrov:

"Stolypin is the guest of Kiev; you are a resident of Kiev—how could you forget the most elementary rules of hospitality?"

To which Bogrov replied:

"Stolypin is the Premier responsible for his régime. And I am a terrorist by conviction." Both the Premier and his assassin were "terrorists"—one on a larger, the other on a smaller scale.

NEW YORK CITY.

# Neutralize the Air!

BY NATHANIEL SCHMIDT

Professor of Semitic Languages at Cornell University.

ON the 4th of May, 1911, the Congress of International Law, assembled at Madrid, adopted resolutions affirming the right of nations to use aerial craft in war, provided that such use is not accompanied with greater danger to non-combatants than warfare on the earth and the sea, and the right of aeronauts to free and international circulation subject to the measures that the governments may take in the interests of public security.

This action is important as indicating the present attitude of many distinguished students of international law. They are anxious to prevent any increase, by new discoveries and inventions, of the sufferings entailed by war, and to regulate, so far as possible, the conduct of belligerents in the interest of humanity. At the same time it is not quite clear to them on what ground, if the legitimacy of war as a last resort is conceded, belligerents can be prohibited from carrying their hostilities into the air, or how nations can be persuaded to forego the advantages offered by the perfection of aeronautics.

When the First Hague Conference met in 1899, it was comparatively easy to reach an agreement "to prohibit, for a term of five years, the launching of projectiles and explosives from balloons, or by other new methods of a similar nature." Of the twenty-six nations represented only four failed to sign the agreement. These were Great Britain, Italy, Japan and Luxemburg. It is noticeable, however, that of the twenty nations (nineteen American republics and Korea) not represented at the conference, but invited to give their adherence, not a single one saw fit to sign this declaration. It was expressly stated that the prohibition was not to be enforced in the case of a contracting Power waging war with one which had failed to sign the agreement.

At the Second Hague Conference, in 1907, forty-four nations were represented. Korea had practically ceased to be an independent state; Costa Rica and Honduras did not send delegates; Afghanistan, Morocco, Liberia, Monaco and San Marino were not invited. When the same declaration was presented, twenty-seven voted in favor of it, among them Great Britain and Luxemburg. It is especially noteworthy that on the American continents seventeen republics voted in the affirmative, while only five (Guatemala, Nicaragua, Chile, Paraguay and Venezuela) failed to subscribe. Italy and Japan voted as in 1899. But ten nations that then had been in favor of the declaration now failed to give their adherence, viz., Denmark, Germany, France, Montenegro, Rumania, Russia, Servia, Spain and Sweden. The result is that a bare majority of the independent and sovereign states, not including some of the most powerful and progressive nations on the European continent, have agreed not to launch projectiles and explosives from balloons in wars between themselves until the end of the Third Peace Conference, probably to be held at The Hague in 1915.

A distinct gain, however, was made in 1907 by the passing of an amendment to Article 25 of the Laws and Customs of Land Warfare of 1899, so as to make it read: "The attack or bombardment, by whatever means, of towns, villages, dwellings or buildings which are undefended, is prohibited." No reservation was made against this article as amended by any nation, and only a defended position can, therefore, according to the law of nations, be attacked by aerial craft, if used in war. It should also be observed that projectiles and explosives were not launched from balloons by either the British in the Boer war or the Japanese in their wars on China and Russia. None of the belligerents were bound by the Hague declaration. But the moral influence of such a declaration is not limited to the signatory Powers. Any civilized nation must needs hesitate, even if

it is not bound by a technical obligation, before it stoops to the dishonor of using so glorious an achievement as the conquest of the air to increase the horrors of war. Any government would also be reluctant to take the first step, if it is ever to be taken, in view of the criticism such action would be sure to call forth from a watchful opposition within the nation.

It is a significant fact that the two Hague conferences, as well as the recent Congress of International Law at Madrid, should have deemed it expedient to pass judgment in advance upon the lawfulness of invading with war an element where no battles between nations have ever been fought. No assembly of jurists dreamed of deciding beforehand whether Sesostris and Sargon, Alexander and Hannibal, Jenghiz and Napoleon, might use the earth for the exercise of their military talents. Nor was it considered necessary to discuss the legitimacy of naval warfare before the Phenicians were permitted to put their triremes on the Mediterranean, or the engagements were allowed to take place at Salamis, Mylæ, and Actium, Chioggia, Lepanto, and Gravelines, Trafalgar, Manila, and Port Arthur. The right of some types of war to continued existence has, indeed, been so thoroly questioned as to lead to their abolition. Private wars can no longer be legitimately waged. Piracy on the high seas has been suppressed. Religious wars have ceased. Numerous practices involving unusual cruelty and hardship, once universal, have been abandoned. But aerial warfare is the only form of armed conflict that has been summoned before the bar of human justice to prove its right to be born.

The limiting clause is also of great value. Even if the right to wage war in the air be granted, it is not, in the judgment of the congress, absolute. It is conditioned upon its not interfering with the rights of non-combatants. The principle is noteworthy. Belligerents, as disturbers of the world's peace, are not to be permitted to lay down the laws of the conflict to suit their own interests, but must restrict themselves within the bounds set for them by the peace-preserving nations. They must not bring on dangers greater than those encountered by non-combatants in wars on earth and sea. That is putting the emphasis in international law where it belongs. The rights of nations pursuing the legitimate interests of mankind are superior to the rights claimed by those who by violent means break the order and tranquillity of the world's life.

A great deal of recent international legislation has had for its aim to secure the interests of the masses of men, women and children in the belligerent nations who take no direct part in the trial of strength. The issues of war are decided by trained armies and navies in regularly pitched battles, by the investment of fortified places, and by blockades of defended ports; while the rank and file are left to pursue their ordinary occupations. The sacking of cities, the burning of towns, the looting of property, and personal violence to the inhabitants of a conquered place are prohibited. New measures are constantly devised to secure the safety of those not directly participating in the struggle. This regard for the danger of non-combatants, in the resolutions passed at Madrid, is therefore in harmony with well-established tendencies of international law.

The recognition by the Congress of International Law of the right of governments to circumscribe the freedom of aeronauts in the interests of public security is wise and timely. A new realm opened up for man's activities might easily invite anarchy, offer a refuge for criminals, facilitate the evasion of just laws, make smuggling easy, and in times of civic upheaval and war give a vantage ground for the enemies of social order. An international code of aviation is a necessity; and important measures toward the elaboration of such a code were taken at the last meeting of the Institute of International Law, held in Paris at the end of March and the beginning of April, 1911.

Nevertheless, there is some cause for fear that the resolutions passed by the distinguished international jurists at Madrid may prove a greater source of satisfaction to those who are eagerly preparing for what Professor De Martens has described as "a violent interruption of the pacific course of the life of

the nations" than to the friends of peace. There are thousands of busy minds and hands that are working, backed by strong governments, for the creation of efficient aerial navies, and thousands of restless spirits anxious to see such a military equipment in the air in active service, regardless of cost. To them it will be gratifying that international law thus apparently is ready to place itself on their side by affirming in principle the right of nations to use aerial craft in war.

There is a certain vagueness in the language used. The term "non-combatants" is often technically employed to designate those who accompany an army without taking part in the battles, such as postal and telegraph officials, photographers, interpreters, secretaries, reporters, doctors, nurses, ministers, quartermasters, sutlers and the like. This is the only meaning of the term noticed by so eminent an authority as General Den Beer Portugael in his "Oorlogsrecht," p. 196ff. Section 1, Article 3, of the Laws of War adopted by the Second Hague Conference, declares that "the armed forces of belligerent nations may consist of combatants and non-combatants," and that "in the case of capture by the enemy, both have the right of being treated as prisoners of war." On the other hand, it is evident that the term may be used for persons not connected at all with the "armed forces" of the belligerent nations. The inhabitants of a beleaguered city probably fall within the category intended. But are all the people living on land, or sailing on the sea, beneath the place selected for an aerial battle, and the larger space covered by pursuing and fleeing airships, non-combatants within the meaning of the term?

Again, what constitutes "greater danger"? How can it be measured, and by whom is it to be computed? Conveyance of projectiles and explosives that will destroy life and property is the very nerve of war today. The right to the use of aerial craft in war would not mean what those anxious to have it affirmed really desire, if it should not include permission to employ such means of destruction. In case the Madrid declaration should become the law of nations, shooting from one airship at another would be allowed, unless it could be shown that it involved a greater peril to non-combatants than, e. g., the sinking of one warship by another on the sea. The launching of bombs from balloons and aeroplanes would be permitted, unless it could be demonstrated that it entailed more dangerous consequences to non-combatants than, e. g., the destruction of railroads, telegraphs, telephones, crops, dwellings and the lives of men by an invading army. Disabling an airship so that it falls to the ground would be regarded as legitimate, unless it could be satisfactorily proved that the danger to non-combatants from the collapse of aerial craft must be greater than that. e. g., from a siege, a blockade, or a pursuing army corps.

But what of the dangers to the combatants themselves? These have been considered in recent international legislation. To disregard them is not in accord with the spirit that seeks unceasingly to diminish the sufferings attendant upon war. It is the chance of survival that keeps the soldier's courage up. He may swim away from a sinking vessel and save his life. He may be wounded, yet by gentle hands be taken from the fire of battle and be nursed back to health and strength. He may be taken prisoner, yet be sure of humane treatment and restoration, when the war is over, to home and friends. But the disabled airship would fall to the earth below, crushing its cargo of living and dead. There would be no friendly shore to which the aeronaut might swim. Even at best the care of the wounded could not be what it is on earth; and there could scarcely be a question of taking prisoners. Nor are these dangers imaginary. Once grant to aerial craft the right to take part in warlike operations by the use of projectiles, and the effort on the part of the enemy to disable them will follow as a matter of course, and likewise concerted action definitely planned.

Another consideration seems to have been overlooked. Even if the dangers could not be proved to be greater in themselves, it is perfectly evident that by permitting them the amount of danger to all concerned would in the aggregate be vastly increased. The action of the

congress seems a step backward from the position taken by the representatives of a majority of the nations at the two Hague conferences. Instead of receding from this position, it would seem to have been the part of wisdom to reinforce them, and within the province of international law to go still further to the exclusion of other forms of warfare in the air, such as ramming and boarding airships, use of cutting instruments in disabling balloons, or other interference by belligerents with the free circulation of aerial craft.

To leave it with the individual governments to decide upon the necessary restrictions does not seem sufficiently to guarantee that these restrictions, in the case of nations engaged in war, shall be such as to secure the interests of humanity, or, in times of peace, possess the desirable uniformity. It is to be regretted that the Congress of International Law did not recommend that the measures limiting free and international circulation in the air, in times of peace as well as war, be formulated by the representatives of all the nations at The Hague. If it is thought safe by the United States, Great Britain and France to leave even questions involving national honor to the arbitrament of the court at The Hague, it would certainly seem safe and expedient to refer to this court the decision in regard to the proper limitations upon the use, by nations or individuals, of the circumambient air.

It is not improbable that the first step toward the establishment of an international police will be taken in connection with the necessary enforcement of international law in the atmosphere. The numerous regulations that are now being formulated and that must be passed in the immediate future necessitate such a force. The safety of mankind in all elements demands it, and the obliteration of national boundaries in the air requires it to be international in character and possessed of international authority. As the efficiency of a small body of police in a city depends chiefly upon the respect for law and order of the majority of the people, the fact that the population as a whole is practically deprived of arms, and the likelihood of a penalty being actually inflicted for resistance to duly constituted authority, so it will be readily seen that the efficiency of an international police force in the air must depend upon the same conditions. It will be in a position to maintain order under ordinary circumstances, and, in case of hostilities between nations, to look after the rights of neutrals and the interests of non-combatants, as well as to enforce the laws that may have been passed in regard to proper means of communication and transportation, scouting, signaling, espionage and contraband of war, just in proportion as the authority of mankind is respected and the nations have decided to forego the imaginary advantages of the use of aerial craft in war.

The right to such use could have been denied on the ground that it has been found more and more expedient to limit and restrict the field and freedom of martial operations, and to increase the scope, significance and application of the principle of neutrality. It has become generally recognized that it is possible for a country to enjoy permanent neutrality, to be free from any danger of ever being made the scene of war, without the slightest reflection upon the honor, courage or intelligence of its people. Switzerland, Belgium and Luxemburg are examples. It is also possible to make a waterway that is to be used by all nations permanently neutral, denying the right to any warlike act within its limits. That has been shown in the case of the Suez Canal. If, in harmony with international law and practice, parts of land and sea can thus be declared permanently neutral and exempt from any operations of war, it certainly would have been within the competency of the learned international jurists at Madrid to affirm the right of the air to such a permanent neutrality, such an exemption in the interests of humanity.

This is the ideal which pacifists should have in mind. Public opinion must render it impossible for the representatives at the Third Hague Conference in 1915 to affirm the right to the use of aerial craft in war, and, on the other hand, incumbent upon them to pass a convention prohibiting belligerents from launching projectiles and explosives from airships.

# Literature

## The Campaign of 1860*

THE new historians are among us, when the leader of the younger group of students of the Civil War, writing in a New England university, can say without a quiver that "secession was right, for any people, prompted by the commonest motives of self-respect and self-defense, and with no moral scruples against slavery, would have followed the same course." But these words of Professor Fite, stating the problem from the Southern point of view, need the interpretation and explanation that he gives to them, in great detail, in the pages of his new study. In his last book Professor Fite showed us that after the Civil War had begun the North and West continued in a marvelous economic growth that almost belied the existence of a war: he compelled us to revise our inherited ideas that the struggle with the South took all the strength of all the nation. But now he shows that during the year 1860 the slavery controversy possessed men's minds. Anti-slavery was the prime Republican creed, and varied in intensity of expression with the political discretion of the speaker. With all other parties slavery was either neutral, or a positive good; how to protect it and extend it was the dominant question in the Democratic mind. No one can read these chapters on John Brown, and the Impending Crisis, on the views of Congress, and the opinion out-of-doors, and still retain any confidence in the Southern after-thought that secession was not for slavery but for liberty. The presidential campaign saw the crystallization of the conviction of the Southern leaders that they must control or go. They saw no constitutional obstacles to their course because their class interests for a long generation had led them to a view of the Constitution other than that of Webster. A minority in the United States cannot control the Government without a doctrine of nullification and State rights.

For States that believed that slavery was a good, and that secession was a proper remedy, the course of the Confederate States was correct; but we doubt whether the matter is settled by explaining the Southern view. It appears to us that Professor Fite underestimates the Southern opposition to slavery, and overestimates the danger to slavery that lay in the election of Lincoln. The Confederate leaders, tho they may have been entirely honest, may have been wrong. It is quite possible that slavery was on its last legs, and would have died of its own diseases. We feel that the book leans a little too much to the method of treating social problems as tho they could be settled by majority vote, and gives too much credit to sincerity, without showing whether the sincerity was due to self-interest or to fact. But the book is extremely interesting, and rescues from the morass of legend personalities and facts that both explain the past and content us with the present. If it had done no more than prove beyond reach of controversy that the South seceded to save slavery it would be a valuable contribution to accurate historical reasoning.

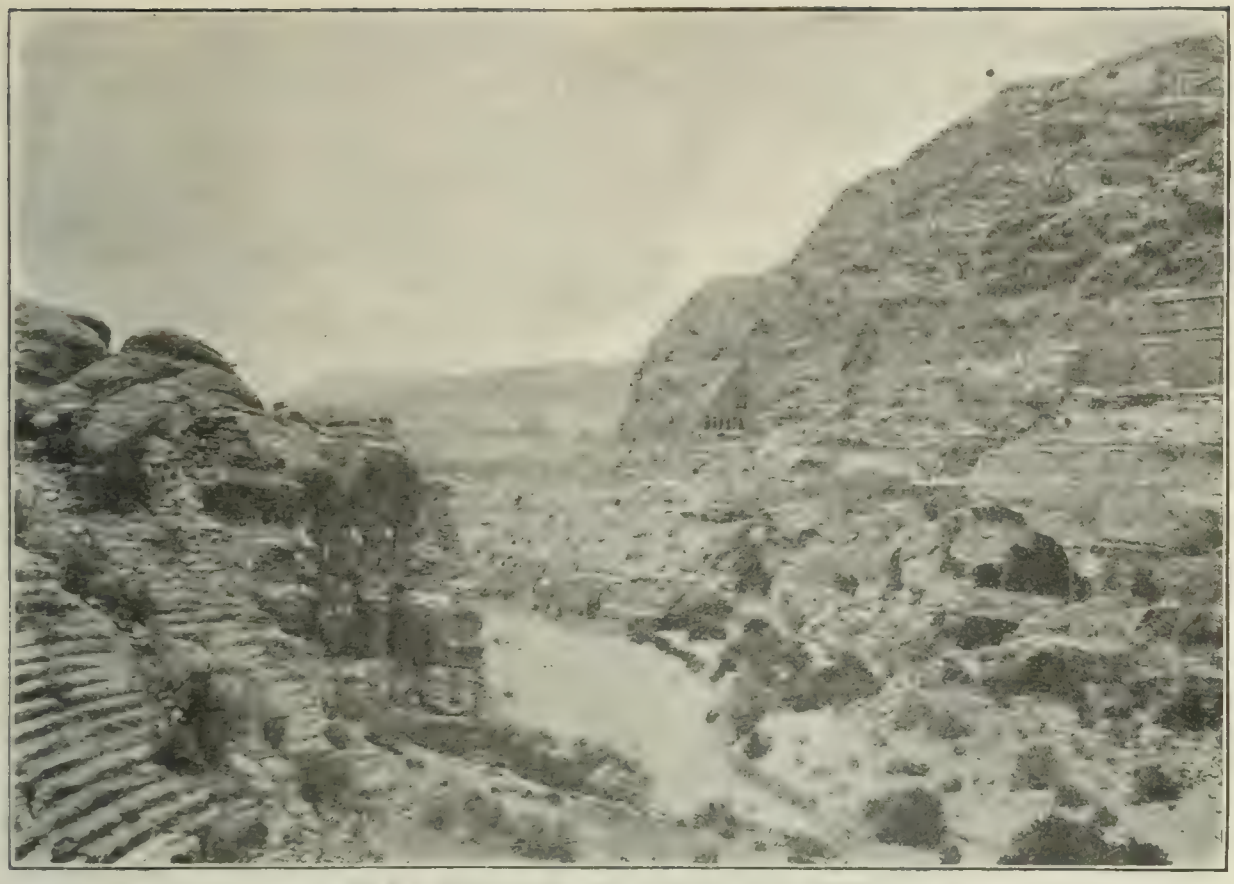
*The Presidential Campaign of 1860. By Emerson David Fite. New York: The Macmillan Company. $2.

## William Pitt

HALFWAY thru this very ample study of Pitt,* which carries his career only to 1791, Dr. Holland Rose tells quite incidentally how he was drawn to the great Tory statesman of the last quarter of the eighteenth century. "Some statesmen," he writes, "merit notice solely from the magnitude of their achievements; others attract attention by the charm of their personality. Pitt claims homage on both accounts"; and Dr. Rose's homage to Pitt is offered thruout in no grudging or stinted measure. To him, Pitt is the ablest constructive statesman England

*WILLIAM PITT AND NATIONAL REVIVAL. By J. Holland Rose. New York: The Macmillan Co. Pp. xii, 655. $6.

had between the Commonwealth and the French Revolution; and Cromwell is the only predecessor with whom Pitt can be compared. Dr. Rose vigorously champions Pitt against Fox and Sheridan, and also against Lecky and other British historians who have not conceded that Pitt at every juncture in his career was actuated by singleness and purity of purpose, and was never deflected by the aims of a politician as distinct from those of a statesman. Dr. Rose's biography is much more detailed—much more concerned with the times in which Pitt lived—than Roseberry's recently published study of Chatham and his place in eighteenth century British history. But it is not nearly so critical as Rosebery's work; for Dr. Rose is usually prepared to explain away Pitt's inconsistencies or failures on the ground that had he risked anything for the principles to which he was committed, his control of the administration might have come to an end, and with Pitt no longer in power, England would have been left without a statesman capable of carrying on the government of the country. Pitt in the years from 1784 to 1793 is always to Dr. Rose the absolutely indispensable man; so much so that one wonders whether there would have been any England to-day if anything had happened to Pitt between the end of the American War and the outbreak of the French Revolution.



WILLIAM PITT.
After a painting by Gainsborough, reproduced as the frontispiece of the study by J. Holland Rose.

Here and there Dr. Rose is candid. He concedes that it was not Fox who led the Prince of Wales into vice—a scarcely necessary concession in view of all that is known these days of George IV. He admits, too, that Pitt's Toryism can be dated from 1785, an admission that explains much in Pitt's career between then and the early years of the French Revolution. Dr. Rose has been as thoro as he usually is in his eulogy of Pitt, and the net result of much research and a volume of many pages is a book that stands midway between the scholarly and the popular. It is scholarly as regards detail and the use of all the available sources in manuscript and in print and in bringing to light all that can be gleaned of Pitt. It is popular in its presentation, and eminently readable, because of its emphasis on the social and lighter aspects of Pitt's career and the extent to which Dr. Rose has drawn upon such gossips as Wraxall for anecdotes and illustration. Moreover the history of the period is given with a detail characteristic of the older-fashioned "life and times" biography, with the result that it is a book that makes an effective appeal to readers who are drawn to Pitt by reason of his fame, but who are not well versed in the history of the period in which he achieved his greatness.

**Palestine and Its Transformation.** By Ellsworth Huntington, Assistant Professor of Geography in Yale University. With Illustrations. Boston: Houghton Mifflin Co. $2.

Professor Huntington describes the land of Palestine entirely from the scientific standpoint. His book is based on materials gathered during an extended visit to Syria two years ago. While not a mere record of that expedition it embodies many of his experiences and is enriched by his acute observations. The author has a theory in regard to the climatic changes in Western Asia, upon which he brings his Palestinian studies to bear with a good deal of elaboration and illustration. He believes that much of the history of the countries there has been materially affected by the "pulsatory" climatic changes, and he holds that

ROCK THEATER AND TOMBS AT PETRA.
From "Palestine and Its Transformation."

the present impoverished condition of the populations around the Jordan territory is not due to ignorance, laziness or bad government, but to lack of proper rainfall. He sustains his contention with a wealth of pertinent archeological and historical as well as geographical material. If it can be shown—and his arguments are weighty if not wholly convincing—that Petra and Palmyra have become depopulated because of failing water supply within the cities and surrounding countries, it will be necessary to revise some historical estimates as well as some plans for the regeneration of the land sacred to Jew and Christian. The occasional light thrown on Biblical questions, as in the suggested site of ancient Sodom, is all the more grateful because incidental.

France in the American Revolution. By James Breck Perkins. Boston: Houghton Mifflin Co. $3.

A few months ago a bronze tablet was unveiled on the campus of St. John's College, Annapolis, to the memory of the French soldiers and sailors who lost their lives in the war of American independence. President Taft and M. Jusserand, Ambassador of France, made formal addresses. And it is M. Jusserand who contributes to the book before us a sympathetic foreword. In discussing the French intervention in our Revolutionary War, "two principal motives explain what happened," he writes:

"a chief one, which has usually been more or less neglected, and a secondary one to which historians usually give the foremost place."

The latter is France's animosity against her old enemy, victor on the Plains of Abraham. But let us not forget that the American Revolution occurred at an epoch when "youthful enthusiasm and ardor pervaded the nation," and men read Rousseau; "and all the reports which came concerning Americans showed them lovers of liberty, practisers of equality, tolerant of all creeds." This was the sentimental view of the people. Long before this, French statesmen had studied the question from another standpoint. Tho to the old-fashioned diplomacy of Madrid his American policy seemed positively quixotic, Vergennes was cold enough in his attitude toward the patriots and yet accomplished more for them than any other of his compatriots

did, not excepting Lafayette. The story of Vergennes's diplomacy, the negotiations of the American Commissioners, and the work of our allies as financiers, soldiers and sailors, is told by the historian soberly and, on the whole, well. Mr. Perkins is known for his "France Under the Regency" and "France Under Louis XV." He was also, during many terms, a distinguished Representative of New York State in the Congress at Washington. His death last autumn prevented his revision of the present volume, that would have gained by condensation. Perhaps, too, he would have deleted, in reading his book in proof, the absurd statement, "Admiration for the noble red man is modern" (p. 310). Distance in space has always ennobled the savage as much as ever remoteness in time did. But what are peccadillos, in view of the general sufficiency of this volume? Mr. Perkins's book deals with an important episode in our history and is destined to remain for years a secondary authority not be disregarded.

Copyright, 1911, by Harper & Brothers.

FROM "A LIVING WITHOUT A BOSS"

**A Living Without a Boss** New York: Harper and Brothers. $1.

This tells of a newspaper reporter, thrown out of his job at forty, who finds it possible to secure a living and not a little happiness in the country. The book resembles another anonymous volume, recently published, "One Way Out," but that was obviously somewhat imaginative while this seems to be closer to experience; at least it is nothing more than could be accomplished by any able bodied and able-minded man who is able to endure adversity with courage and adapt himself to new conditions, provided that he had the right kind of a wife to back him up. The appearance of such books as these is reassuring, for it shows that the old American pioneer spirit of initiative and self reliance is not quite gone yet.

**The Man Who Could Not Lose.** By Richard Harding Davis. New York: Charles Scribner's Sons. $1.25.

The tale which gives the title to the

new collection of Richard Harding Davis's short stories is of doubtful morality since race-track gambling has become illegal. It has all the rush and zest of a race, and altho palpably impossible, keeps the reader's credence to its unexpected end. There are five stories in the book, and each has its special interest. All are vivaciously told, with the art of a master of short-story making. *The Lost House* recalls a recent battle between the police force and the men who had entrenched themselves in a London house. *The Consul* has a fine rebuke to the time-server and a splendid portrait of a man who serves honor and his country.

ROPING A RHINO.
From Guy H. Scull's "Lassoing Wild Animals in Africa." (Stokes.)

**Lassoing Wild Animals in Africa.** By Guy H. Scull, Field Manager of the Buffalo Jones Expedition. With an introduction by Theodore Roosevelt and a foreword by Charles S. Bird. New York: Frederick A. Stokes Company. $1.25.

That the lasso ought not to be confined to the American Continent, but is a weapon good enough to use against big game, even the biggest game, anywhere in the world, is the common belief of the plainsman, and this volume may be regarded as a demonstration of the theorem. To be sure, Buffalo Jones did not get his rope on an elephant, but he is very likely right in thinking that it would be no more difficult than tackling a rhino. As the author puts it: "Precisely how an American cowboy was going to hold a rhinoceros that weighed two tons and a half was purely a matter of speculation. Yet of one thing Colonel Jones was certain — the experiment would result in a moving picture that would be well worth the taking." And so it was those of our readers know who have had a chance to see the cinematograph results of the expedition. The photographer must at times have got under motion rivaling that of his machine. Giraffes, cheetahs, warthogs, lions, elands, rhinoceroses and zebras fell victims to the lassos of Buffalo Jones and his two cowboys, and the story of it is well told.

**Poems by Madison Cawein.** Selected by the Author. Pp. 298. New York: The Macmillan Co. $1.35.

The poems gathered together here are for the most part chosen from the five

volumes of Mr. Cawein's collected verse, and are representative. They therefore reveal the writer as an ardent lover of outer nature, well disciplined in his poet's craft. Mr. Howells, who contributes a foreword, assures us that no one can out-word him:

"when it comes to choosing some epithet fresh from the earth or air, and with the morning sun or light upon it, for an emotion or experience in which the race renews its youth from generation to generation. He is of the kind of Keats and Shelley and Wordsworth and Coleridge, in that truth to observance and experience of nature and the joyous expression of it, which are the dominant characteristics of his art."

One is tempted to carry the quotation from Mr. Howells's appreciation even farther: not out of laziness so much as from the conviction that Mr. Howells has the right of it. "It is imaginable," says this enthusiastic critic,

"that the thinness of the social life in the Middle West threw the poet upon the communion with the fields and woods, the days and nights, the changing seasons, in which another great nature poet of ours declares they 'speak in various language.' But nothing could be farther from the didactic mood. . . . In a certain tenderness of light and coloring, the poems would recall the mellowed masterpieces of the older literatures, rather than those of New England, where conscience dwells almost rebukingly with beauty."

Often, indeed, Mr. Cawein is definitely

From a photograph by Francis Ferrero.

THE GORGE OF THE MARMORE (CHATILLON).

reminiscent of one or another of the English nature poets named by Mr. Howells, most often of Wordsworth; yet never does the reminiscence discredit the newer man, whose sincerity is no less obvious than his melodiousness; as when he sings:

THE GOLDEN STAIRCASE AT BURGOS.
One of the illustrations for John A. Gade's "Cathedrals of Spain." (Houghton Mifflin Co.)

I am a part of all you see
In Nature, part of all you feel:
I am the impact of the bee
Upon the blossom; in the tree
I am the sap,—that shall reveal
The leaf, the bloom,—that flows and flutes
Up from the darkness thru its roots.

I am the seed within the pod;
The worm within its closed cocoon:
The wings within the circling clod,
The germ that gropes thru soil and sod
To beauty, radiant in the noon:
I am all these, behold!—and more—
I am the love at the world-heart's core.

Bees buzz dreamily thru Mr. Cawein's verse, and one of our favorite poems is "The Quest," with its opening line:

"Fine I asked the honeybee

**The Valley of Aosta.** A Descriptive and Historical Sketch of an Alpine Valley Noteworthy in Story and in Monument. By Felice Ferrero. With 39 Illustrations and Maps. New York: G. P. Putnam's Sons. $2.

Because of its lack of railroad facilities and its distance from the main thorofares of travel, the valley of Aosta is comparatively little known to American tourists, who must usually take their sightseeing in haste. But to the leisurely traveler few places in Europe afford more variety of interest or present the charms of nature in a more seductive way. On the north and west lie the highest peaks of the Alps, from which hang numerous glaciers, while down the slopes and thru the ravines and valleys rush the Dora and its tributaries, over waterfalls and rapids, under old Roman bridges, and past scores of medieval castles and Roman remains in various stages of preservation. Fifty miles up the valley from Ivrea lies the city of

Aosta, built by and bearing the name of Augustus Cæsar. This contains some of the most interesting Roman ruins outside of Rome and Pompeii. The description of these antiquities, the castles, the land and the people, the mountain scenery and methods of climbing is interwoven by Mr. Ferrero with the history and legends of the valley in a way that gives unusual charm and attractiveness to his book. The author's accurate knowledge and enthusiasm for his subject, with the fine illustrations, maps and plans, combine to make the volume not only the best of guides to the region, but a welcome addition to descriptive books of travel.

**Cathedrals of Spain.** By John A. Gade. New York: Houghton Mifflin Co. $5.

The book is a handsome one, and the author is properly qualified to discuss his subject—a rare circumstance in books of this kind. He is, indeed, a practising architect of New York City, and offers evidences of having traveled extensively in Spain, and of having studied Spanish churches from the standpoint of both amateur and artist. The present volume is not a mere impressionistic ramble thru place-names and anecdote, and in no way enters into competition with most of the made-to-order books about Spain lately produced by English and American dilettanti. The book is beautiful as an example of presswork, and the half-tones which illustrate it are of uncommon excellence.

**Her Little Ladyship.** By Myra Kelly. New York: Charles Scribner's Sons. $1.25.

This posthumous novel is a disappointment to us, perhaps because we expected too much. But it is evident that Myra Kelly was not long-breathed enough for a full-length novel. The first chapters, depicting the courtship of a New England girl by an English nobleman incognito, the modern representative of the prince in disguise of the fairy tales, are written in her characteristic humor and would have made a good short story, ending as usual with the wedding. But when she takes to England and tragedy she is not so successful. The book ought to serve, however, as a moral lesson to American girls never to marry a foreign nobleman, for while he may be nice some of his relatives, his brother for example, may not be nice at all.

**Harriet Beecher Stowe.** The Story of Her Life by her son, Charles Edward Stowe, and her grandson, Lyman Beecher Stowe. With Portraits and other Illustrations. 12mo, pp. ix, 313. Boston: Houghton Mifflin Co.; $1.50.

For more than twenty years has the public waited for this loving biography of one of the truest, greatest women that have ever illuminated American life and literature. The portraits of her and her learned husband, Professor Calvin E. Stowe, recall her mobile face guarded by its long old-fashioned curls, and his long beard, which he had vowed never to shave until the Fugitive Slave Law was repealed, and which he never did remove, for with the Civil War came in fashion the full beards. Some will read this book for the interesting story that tells how she wrote "Uncle Tom's Cabin," and others will take a special delight in the pictures it gives, often from her letters, of the strenuous years when Mrs. Stowe was a girl learning sound theology from her father, Dr. Lyman Beecher, followed by the days when as a young wife and mother she almost fought wild beasts at Lane Seminary, Cincinnati, and solidified her anti-slavery principles, afterward living her peaceful mature years at Andover. No other book that we know so well pictures that sort of life, unless it be "Andover Days" by Mrs. Robbins. The son and the grandson have done a difficult work well, and have presented a fair picture of one who was a novelist, a poet, a rebellious reformer, more a Christian than a saint.

## Literary Notes

....A number of Catholic journals have made a savage onslaught on the new *Encyclopædia Britannica*, charging that it is guilty of false and malicious treatment of Catholic matters. The London *Tablet*, the leading British Catholic journal, comes to the defense of the *Britannica*, showing that the specifications in part misrepresent the facts, and that while some errors are to be found in the *Encyclopædia* others are of minor importance and that a multitude of articles on Catholic subjects are written by Catholic scholars.

....*The Peace of the Solomon Valley,* by Margaret Hill McCarter, is a glorification of Kansas in faint fictional form and a gorgeous sunflower cover. (McClurg, 50 cents.)

....A very little book is Una Birch's *Mary Stuart,* published by Funk & Wagnalls in their Hour Glass series (40 cents). Even when told in so condensed a fashion, the story is a moving one.

....A somewhat unusual volume is that by George Forbes entitled *Puppets* (Macmillan; $1). Cast into the form of narrative, it provides the author with an opportunity to discourse of modern science and philosophy to his heart's content.

....E. V. Lucas is an entertaining writer, whatever his subject of conversation, and in *Old Lamps for New* (Macmillan, $1.25) he discourses brightly on Sympathy, Vermeer, Sunburn, Owls, Windmills, and a host of other unrelated subjects.

....A popular account of *Sinai in the Spring,* by M. J. Rendall, has for its subtitle "The Best Desert in the World" (Dent, $1.50). The volume is illustrated from photographs by the author and will please biblical student and casual reader alike in moments of relaxation.

....There are many manuals for the pocket use of clergymen and the latest, the *Minister's Companion,* and as good as any, is by Dr. David G. Wylie, with the approval of Drs. Burrell, Eckman and Jefferson, of this city, and published by Thomas Nelson & Sons ($1). It is full, compact, readable, and the biblical selections are from the American Revision.

....Excavations at Vignati-Corte, near Licenza, have brought to view undoubted evidences of the Sabine Farm, presented to Horace by Mæcenas. Primitive wall panels have been found, and a mosaic pavement of the Augustan epoch. The villa stood on the top of a hill, confined on two sides by the little stream Digentia. A garden of generous proportions, arcades, and a pool over 60 feet in length have been discovered, as well as other appurtenances.

....In the October *Century* our Commissioner to the Roman Art Exposition of 1911 writes of that exposition and what he saw there. The British sum of knowledge respecting American art is not overwhelming, one infers. Thus a lady of English birth asked an American dame whether they had any painters in America. "Oh, yes," said the American, according to Mr. Morris, "you have some of them here—Sargent and Abbey and Mrs. Merritt and McLure Hamilton." "Dear me," said the English lady, "you'll be claiming Whistler next!" As a matter of fact, Sargents, Abbeys and Shannons and a Mark Fisher were all shown at Rome in the British pavillion.

....*A Tour and a Romance.* By Alice E. Robbins. New York: Baker & Taylor. $1.50. The old device of throwing a conventional tour into the narrative form, with "she said" and "as he lighted a cigarette" used often enough to relieve the tension of the travel-descriptions, is used here once more in an illustrated account of an ocean crossing, Spain and Tangier.

....Kenyon Cox is one of the rare painters who is able to express himself coherently in terms of language and for that reason, no doubt, was chosen to deliver the six lectures on painting on the Scammon Foundation at the Chicago Art Institute last winter. The lectures are now published with 32 illustrations by the Scribners under the title *The Classic Point of View.* ($1.50.) The Classic Spirit, The Subject in Art, Design, Drawing, Light and Shade and Color, Technique, furnish the successive chapters of an instructive and easily read book.

....Let us not think of Mexico as a country entirely devoted to peons and revolutionists. Thruout Latin America there are groups of poets, critics and thinkers who are working with a common impulse toward a new birth of Spanish literature. In a preface to the "Cuestiones Estéticas" of Alfonso Reyes, published at Paris, Señor Francisco Garcia Calderón lately wrote of some modern Mexican authors:

"Alfonso Reyes belongs to a sympathetic group of writers, a little Mexican Academy for free discussion of Platonic ideas. Pedro Henríquez Ureña, son of the poetess Salomé Ureña, is the Socrates of this fraternal group. He will be one of the most certain glories of American thought. Critic and philosopher, he is a soul evangelical and protestant, eager for great problems and profoundly versed in Spanish and Italian literature. Joined with him are Antonio Caso, a philosopher deeply schooled in Nietzsche and Comte, sunken in meditation, eloquent, the creator of beautiful syntheses; Jésus I. Acevedo, great architect of ideas, distant and melancholy, lost in the contemplation of his visions; Max Henríquez Ureña, brother of Pedro, artist, journalist, and brilliant musical critic; Alfonso Craviolo, art critic, and others various and fine, whose affection for noble idealism harmonizes with the richest variety of special scientific knowledge. Among these, Alfonso Reyes is the Benjamin. He is the son of General Bernardo Reyes, Governor of a Mexican State and a rival of Porfirio Diaz."

All these new Latin American authors hold by France. Also, of the space which French and Italian journals give to American events, political or literary, the greater part is devoted to Latin America. The United States usually plays a bad second to some little republic of the south whose existence we succeed in ignoring.

slang has been made the subject of a special course in the University of Paris: an innovation which inspires Albert Daugat with an interesting article on the subject ("L'Argot"), published in *la Revue.* Two great names in French literature are inseparably associated with argot: both François Villon and Jean Richepin, who was in his ante-academic days called a nineteenth century reincarnation of Villon, have written their *Sonnets bigornes.* One has no right, we may add, to use the word slang as an English equivalent of *argot;* which in its larger connotation includes all the vocabularies of restricted usage—words of the trades, sporting and theatrical cant, stock exchange phrases.

....Frank Palmer, a London publisher, issues a volume by Ashley Dukes entitled, *Modern Dramatists,* to which the editor of the Chicago *Evening Post's* "Friday Literary Review" devotes a whole page. Here are some quotations at second hand:

Wedekind: "His plays are the most aggressively individual of our time . . . The individuality behind them is crude and obtrusive. It is almost devoid of taste or sense of form. But it is valuable because of its power. It offers us a rare criticism of modern life by presenting it from a new angle."

Schnitzler: "He has never made his way out of the half world into the real world. But among the dramatists of the half world he is supreme."

Maeterlinck of the early plays: "The subconscious mood, hitherto expressed only in music, found words."

D'Annunzio: "The conjurer is sometimes a magician. He has the will to illusion. Let us be grateful."

The Chicago critic closes his article with some astounding observations of his own. We quote in part:

"Mr. Dukes . . . has said little in his book about things so superficial, so incidental, so inevitable in good art, as beauty. He knows that in the world of art beauty is a by-product. In the place of beauty he puts up inspiration as the thing to be achieved."

....Fiction, says the *Saturday Review,* is today written mainly by women; and this has an unhappy effect upon the language.

"'Man-like' is a woman's word; so is 'friendly-wise' and 'alright.' No male author would make the heroine say 'I am a very woman!'

"Heroines lead an anxious and harassed life. . . .

"Ladies, when exceptionally tender, 'flute,' and girls . . . do things in brackets. They speak (gloomily) and (grudgingly) and (archly). Grand-uncles are addressed (yearningly). Heroines do not reply; they 'flash.' The best heroines 'ripple.' 'How man-like!' Aminta 'rippled.'"

The hero, on the other hand, doesn't make the slightest ripple; it is his business to meet with accidents; after he has been thrown by his horse, he needs "womanly care and compassion." He falls down precipices; is sandbagged; runs a hook into his "poor hand" while fraudulently pretending to fish, and "almost faints." Awakened out of a "swoon," he sees a face whose "beauty is graven forever on the tablets of his memory." Their helplessness is modern heroes' prevailing note. They rival in softness eighteenth century heroines.

## Pebbles

COUNSEL (to nervous witness)—Married or unmarried, madam?"

Witness—Er—unmarried three times!—*Public Opinion.*

THE LEISURE SEX.

"Now, concerning our leisure sex . . ."
—*The Call.*

Soak and rub and boil and rinse;
(The sun's on the apple-blooms outside!)
Tubs, pans, pins, lakelets of blue;
Hillocks of white, bursting—bubbling—thru;
The kitchen's amuck with steam and haste,
Slatternly labor and watery waste;
A woman dodging from stove to tub;
Soak and lather and rinse and rub;
(The sun's on the apple-blooms outside!)
Two sodden hands folded, white at last;
Over her, tired, The Great Rest cast,
One of the Leisure Sex.

Polish and crawl, and crawl again;
(The world's a-dance in the Park below!)
The endless length of the corridor,
Inch by inch o'er the marble floor,
The creeping women lather and scrub,
Lather and rinse and dry and rub;
Polish and crawl and lather anew,
The crimson breakings, the midnights thru;
(The world's a-dance in the Park below!)
Aching knees unbended, straight at last;
Over her, tired, The Great Rest cast,
One of the Leisure Sex.

Scour and sweep and shine and clean;
(The book's forgotten upon the shelf!)
Mops, brooms, dishes, windows and doors;
Peelings and grounds, crusts, tops and cores;
Moths and iron rust, mold and gashes;
Stains, rents, roaches, mice, coals and ashes;
From garret to cellar with the rounding sun;
A day ended but a day begun!
(The book's forgotten upon the shelf!)
A broken frame stretched, healed at last;
Over her, tired, The Great Rest cast,
One of the Leisure Sex.

Envoy.

Oh, men who work, and children who play,
The dirt of the world is cleaned away
By the dainty Leisure Sex!
—*New York Times.*

"LIKE THE MONA LISA THEFT."

Minneapolis, Sept. 10.—It became known today that a picture, "Die Frau," valued at $1,000, was stolen from a hotel parlor here last night under circumstances similar to those surrounding the theft of "Mona Lisa" in Paris recently. The picture, by C. P. Ream, was owned by Mrs. Simon Kruse, and was one of a valuable art collection. It was cut from the frame.—*Despatch to Philadelphia Record.*

This is indeed tragic. And is it "like the Mona Lisa theft," we wonder, because "Die Frau" was painted on canvas, while the "Mona Lisa" was painted on a wooden panel, or because of the frequently noted similarity in style between Leonardo da Vinci and Mr. C. P. Ream?

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Moslem and Christian

WHEN the common voice of England, Exeter Hall England, and of Germany of the mailed fist, agree in severely condemning the rude violence of Italy in seizing one of the provinces of Turkey, and when Austria, still red with the robbery of Bosnia and Herzegovina, adds her mild protest, we may indulge our safe indignation at the unprovoked act of Italy in declaring war. Like a bolt from the clear sky came the sharp demand, followed within a week by the threat to occupy Tripoli if Turkey did not give her consent in twenty-four hours. Of course, Turkey's consent was not expected, for Tripoli was to be taken anyway. That was the robber's will There was no parleying, no chance for negotiation, much less for arbitration; nothing more than the highwayman's preliminary "Hold up your hands." What less than that was the order to Turkey not to resent the landing of troops?

What particularly concerns us is, that this is the act of a so-called Christian Power to a Mohammedan Power. We do not wonder that a Turkish journal asks what sort of Christianity this is. We declare that it is a disgrace to the Christian name—not simply as war is essentially unchristian, but that this is a peculiarly wicked sort of war as wars go. There was no excuse for it, only the most transparent sort of a pretense. The world has heard of no particular disorders in Tripoli, nothing like the disorders in Morocco, which presented some sort of apology for France and Spain in their partition of that unhappy country. So far as anybody has known the conditions in Tripoli have been about what the people like, and the Italian traders there have not been very badly treated. England has made no complaint, and she has nearly as many Maltese subjects in Tripoli as there are Italians. It is simply a case of coveting the land, long coveting it, just as Ahab coveted Naboth's vineyard. What will Mohammedans the world over think of the Christianity which to them Italy represents? We Americans have many missionaries and many Christian colleges, schools and hospitals in Turkey; what will the Turks think of our religion of greed and grab? What will they think when not one of the Christian nations that were pledged by solemn treaty to preserve the integrity of Turkey will lift a hand to protect, or a voice to protest? It is very wrong of Italy to do this, say the people thru their press, but one government after another says it is none of their business.

Might not Austria protest? Oh! no, for Italy is only following Austria's example. Austria has herself only a few years ago, while the people denounced and the governments were passive, robbed Turkey of two of her fair provinces. Turkey submitted then because she could not help herself.

Might not Germany, Turkey's dear friend, help Turkey in this distress? Not at all. Did she not only a few weeks ago send her war vessel to Agadir so that she might get a share in the division of the Moroccan spoil? So Turkey appealed to Berlin, but got the cold answer, *Non possumus.*

France? But that would be quite impossible, for France took first Algeria and then Tunis in much the same unprovoked way that Italy is taking Tripoli, and she is now absorbing Morocco. She

must be silent, and it looks very much as if the Dreibund had long ago agreed among themselves, Austria, Germany and Italy, to seize what they could in Africa, and all are getting a slice until not a Moslem Power shall hold control of a mile of the African shore from Gibraltar to the Red Sea

But might not England protest? She has Egypt—to be sure on a much better right, since France withdrew and left her in control after Arabi's rebellion. Yet England, with her millions of Moslem subjects, has not been heard to utter a word of protest. At least she might have spoken.

Then could not the United States at least utter the word which might express the protest of Christianity and honesty against this act of violence done to a nation which had acknowledged its error and was trying to create a constitutional and civilized state? We are very glad that the Hon. Oscar Straus, more than once our Ambassador to the Porte, has publicly appealed to our Department of State to offer its services to put an end to this war, but we wish more had been done, and sooner. Turkey makes a second solemn appeal to the Powers for their intervention; can they refuse?

And one more Power there is, a spiritual one, that has disappointed us, and that is the Vatican. It had not hesitated in behalf of its own dignity to denounce the Italian Government and use its excommunications when the territories it ruled were taken from it. But now the Pope's sympathy is with the marauder, and his prayers are for the Italian army and navy. Why? Evidently not be-because Italy has justice on her side, but because Turkey is Mohammedan and not Christian, as if Mohammedans had not the same right to equal justice as Christians have. This is an act that will hurt Christianity among some hundreds of millions of men, and delay their acceptance of Christianity.

Yes, but we are told it is time that Moslem power should end, that Moslem civilization is not equal to the Christian, that Italy will rule Tripoli better than Turkey has done, will introduce science and trade, agriculture and automobiles. Very likely, altho Italy has not yet conquered her own illiteracy, and is not a model state. Nevertheless, we allow that our modern civilization, with its good and its bad, will advance the trade of Tripoli, which is well; but that good is no sufficient reason for Italy's putting herself in that class of people of whom St. Paul says that their "damnation is just."

We will not now stop to dwell on the danger which this rash act incurs. Who knows what reprisal Turkey may make on Greece in Epirus, or what terrible outbreak may occur in Macedonia, or what advantage Crete may take of this opportunity, or what fanaticism may stir the Mohammedans not of Turkey alone but of the world to start a holy war, or what massacres of Christians in Turkey, or what nations of Europe may be involved in a veritable Armageddon? We hope not, but the world fears, and laments the rash, the unprovoked deed that puts Christianity in the wrong before the Moslem world, and raises a specter of terrible violence, which may a merciful Providence and the more Christian forbearance of a Mohammedan nation avert!

## The Land of the Lotos-Eaters

ANOTHER chapter is about to be added to the history of Tripoli. Whatever may be written therein it seems safe to turn over a new leaf and head the page "The End of Turkish Control and the Beginning of the Italian Occupation." Many such headings have been written, for Tripoli has forgotten more history than most countries ever knew. Race after race has invaded it, only to be ignominiously absorbed, like the streams that rise in its uplands and sink into the sand before they can reach the sea. A country without boundaries or defenses, unified neither by geography nor patriotism, Tripoli has always been an open road, a defile between the desert and the sea, traversed by armies eastward and westward, often fiercely fought for but never long retained. It is a land of ruins, some revealing the prosperity of famous cities, some dating from a time immemorial to man. Here are altars erected to unknown gods by unknown peoples, giant portals leading nowhere, made of pillars of unhewn stone, with a third hoisted

by some mysterious mechanism and laid across them as a lintel; dolmens and cromlechs rivaling Stonehenge. Who raised them and why no man can tell. But this arch of richly sculptured marble, half buried in the rubbish of a Tripolitan street and sheltering a wineshop in its curve? Here we have no doubt, for it bears the name of Antoninus Pius. And these crumbling ramparts in the hills of Derna and the unfinished dock in the harbor below, we know who erected them; they are the relics of the American occupation of 1805, when a soldier of fortune, William Eaton, of Woodstock, Conn., backed a weak-minded pretender to the Pashalik, and with a few hundred men defended the post against the attacks of the Arabs for a month and a half.

Twenty-five hundred years backward extends the written history of the country, to the time when a band of insurgents from Sidon founded a city where is now Tripoli, not far from their kinsmen of Carthage. Dorians settled to the eastward at Cyrene in Barca in 630 B. C. Between these rival colonies stretched a vast sandy plain without river or mountain to mark the boundary. Consequently long and bloody wars were fought on land and sea between the Phenicians and Greeks, until it was feared that both, being weakened, would fall a prey to some common enemy. So a boundary conference was called and it was agreed to fix the dividing line at a point half way between the two colonies, this point to be determined by the simple process of sending out a deputation simultaneously from both cities, and where they met to set the term. The Carthaginians appointed as their representatives two brisk young fellows, the Philaeni brothers, who, walking eastward, had covered much more than half the distance before they encountered the other delegation. Now, whether the Cyrenians had been delayed by a sandstorm or were just naturally lazy, is still an unsettled question and likely to remain so, but, at any rate, they were mad at being met so soon and accused the Philaeni of cheating by starting before the appointed time. The Cyrenians demanded that, as a proof of good faith, the Punic brothers consent to be buried alive on the spot, or allow them to proceed westward as far as they thought proper on the same terms. The Philaeni accepted the first horn of the dilemma and were buried on the boundary they had established. The Carthaginians instituted solemnities in their honor and erected an altar over their tomb, which is still standing, or at least it was when Sallust was governor of Africa.

But it does not matter now whether this monument to patriotism is yet discoverable or not, for it no longer marks a boundary. The Romans fell heir to both the Phenician and Greek colonies, and the Land of the Three Cities became one of their most flourishing provinces, as attest the remains of superb temples, enormous amphitheaters and sumptuous villas. What we call Tripoli was Oea, the middle one of the Three Cities, while fifty miles to the east of it was Sabrata and fifty miles to the west was Leptis Magna, where was born the Emperor Septimius Severus. The Pentapolis at the Greek end of the country comprised the five cities of Cyrene, Hesperides, Arsinoë, Apollonia and Barca, which last now gives its name to the whole district.

Where now poverty-stricken Berbers and Arabs maintain a feeble agriculture were once centers of art, science and literature. Callimachus, foremost of grammarians and librarian at Alexandria, was a descendant of the first King of Cyrene. Eratosthenes, his pupil and fellow countryman, sucessfully measured the circumference of the earth and the obliquity of its ecliptic. The Cyrenaic school of philosophy, one of the several ways of reconciling the pleasures of life with the principles of philosophy, took its name from Aristippus of Cyrene. Here also was born the philosopher Carneades, a precursor of our pragmatic realists and founder of the New Academy; and Bishop Synesius, harmonizer of Platonism and Christianity, whom most of us know thru the medium of Kingsley's "Hypatia."

But after this the slate was wiped clean of Greek and Roman civilization, and there has been nothing worth reading written on it since. First came the Vandals from the Vistula, marching down thru Russia, Germany, France, Spain

and reaching the end of Europe at Portugal. From Lusitania to Mauretania is but a step, not as now across the Cunard dock, but over the Pillars of Hercules. So westward along the African coast the Vandals pursued their victorious march as far as Cyrene, establishing a new Carthaginian kingdom; then a dash across the Mediterranean Sea to the capital of the world and Hannibal was avenged. Carthage had conquered Rome. Next swept the Arab hordes from east to west and the land fell under the blight of Islam, from which it has never recovered. Is it a change of climate that has ruined the region, or is it the change of religion or of race? Herodotus tells of a river with a valley as fertile as that of the Nile, producing three hundred fold. There is not a river in Tripoli today. The Garden of the Hesperides is now a desert. The harbor that once welcomed Phenician, Greek and Roman galleys is used as a salt vat. Even land that was cultivated by the Arabs has reverted to the wilderness under the Turks. The sand of the Sahara has crept close to the sand of the sea.

The Italians claim Tripolitania as the heirs of ancient Rome. Will they make good the claim by restoring the former prosperity of the province? They may conquer, but can they colonize? Will their emigrants sweep back the encroaching desert? Or will they eat of the lotos in this land in which it seemeth always afternoon, forget ambition and merely add another element to the hybrid and degenerate population?

## Trust Law Uncertainty

BUSINESS is affected injuriously because of uncertainty as to interpretation of the Sherman Anti-Trust law by executive officers. After the recent memorable decisions and opinions of the Supreme Court in the Standard Oil and Tobacco Trust cases, many thought the court had given notice that it would not approve the prosecution of corporations which were not harmful, even if they had been made by a consolidation of several distinct companies. There are indications that this is not the view of the Government.

Attorney-General Wickersham repudiated, a few days ago, two brief assertions ascribed to him in the long report of an interview with him at Bretton Woods. One of them was that the Steel Corporation was plainly a combination existing in violation of law. The remainder, he said (and there was much of it), was substantially a correct report of his remarks. That remainder included his answer to the question, "How many Trusts are there which you think ought to be dissolved?" His reply was that he had gone very carefully thru the pages of a well-known handbook or manual of corporations and had found "about one hundred that offered prima facie evidence of being combinations of companies that were once competing concerns."

A fair inference is that, in his opinion, these should be induced, by prosecution or otherwise, to dissolve, in order that competition among the parts may be restored. That is to say, consolidation of concerns which originally were in competition is violation of the statute. It appears that Mr. Taft thinks restoration of competition must be sought, and that weight cannot be given by the Government to the beneficial character of a consolidation:

"Some men engaged in business seem to think there ought to be some statute which shall establish a line between those monopolies that are reasonable and those that are not—those that are benevolent and those that are unconscionable. No such line is possible, and the Supreme Court has expressly so decided."

At the present time the stockholders and the officers of a considerable number of corporations are wondering whether their companies are on Mr. Wickersham's list of "about one hundred" which "ought to be dissolved" and which the Department of Justice may prosecute to compel dissolution. They are disturbed by uncertainty. In the same address from which the remarks quoted above are taken, and in which the President pointed out that it was the duty of the Executive to enforce the law against all combinations known to exist in violation of it, he also said:

"We must have investments from which to secure a large wages fund, which is needed to support the wage-earners. We must in-

spire in the business men who control those investments the confidence that they will not be driven out of business. Let us approve and praise the great business enterprise and genius that honestly and by proper methods accumulates property and puts it into productive industries, supports the thousands of workmen and furnishes profit to those whose savings have gone into the shares and bonds of the enterprise. This is the hope I have for the future. Business is halting now. There is doubt and distrust among investors, due to a fear of blind enmity toward successful enterprises."

There are several incorporated consolidations, probably included in Mr. Wickersham's list of "about one hundred," whose officers and stockholders believe and will say that their companies are truthfully described and characterized in these words of the President. But they cannot ascertain from his utterances or from those of the Attorney-General whether their companies are held to be guilty and must be prosecuted. This accounts for a part of "the doubt and distrust among investors." If corporations which are justly conducted ought to be, and must be, prosecuted simply because they are consolidations of concerns that once were independent and competing, in order that competition among the parts may be restored, this should be clearly made known and understood.

## Madero to Rule in Mexico

For some time after the beginning of the recent revolution in Mexico, Francisco I. Madero did not seem to have the qualities which should characterize the leader of successful revolt against the rule of a man like Porfirio Diaz. He was not a soldier, nor had he been known as a statesman or a legislator. He appeared to be a quiet and amiable person, and was described as a dreamer, a vegetarian and a spiritualist. Not until his controversy with General Orozco, in Juarez, when he was in imminent danger of death, was his real strength of character shown to the world. He is a modest gentleman and a most earnest patriot, who knows the Mexican people and longs to improve their condition. In office, he will strive to give them honest and just government. Probably he will lack the hard force which conditions will sometimes require, and it may be that his program will be too far advanced for a country where the percentage of illiteracy is so high. Mexico has outgrown the rule and ways of Diaz, but may not be ready for the methods and ideals of the dreamer who succeeds him.

There is disappointment for many in the fall of General Bernardo Reyes. Immediately after his return to Mexico he promised, at a conference with Madero, a conference in which President De la Barra took part, that he would not be a candidate for the Presidency, but would loyally assist the revolutionist leader by entering his Cabinet as Minister of War. Ambition led him to break his promise, but his candidacy came to nothing. His foolish boast that by resort to arms he could easily overthrow the present Government excited ridicule. Three days before the election, this "idol of the army" left the capital and his country disguised as a decrepit invalid, asserting after he had boarded a steamship that Madero had plotted to assassinate him. Mexico is well rid of Reyes. We hope she will continue to be served by President De la Barra in some high office, and we should be glad to hear of his election to the Vice-Presidency. He has borne himself well in a difficult situation. Mexico should not be deprived of the services of so accomplished a scholar, diplomat and statesman.

## Bishop Brent's Duty

Bishop Brent has charge of the missions of the American Protestant Episcopal Church in the Philippine Islands. He is an earnest and devoted chief pastor of his flock. He is one that does not like the word *Protestant*, particularly as applied to his Church, and we presume he would sympathize with the missionaries in China who, according to a story, after translating "Protestant Episcopal" for a Chinese prayer book, concluded to omit it because they learned that the words meant "a society of contradicting overseers." It is true that *Protestant* is not a good word to apply to a Church. It does not denote what it is and it connotes something different from itself which it eternally contradicts. He is also definitely High Church, glad to show per-

sonal courtesy to sectaries, but not to recognize their right to valid orders. They have broken from the true succession.

Bishop Brent gave an interesting address at the convocation of his clergy in the Manila cathedral in August, on the subject of the Mission and the Unity of the Church. What surprises us in this address is its tone of pessimism. He sees in perspective what looks to him like the rapid conversion of the nations of Europe in the early history of the Church, and the swift conversion of South America and the Philippines, and he compares it with the fruit of modern missions. "We have sorrowfully to admit," says he, "that the total impression made by the aggregated labors of all Christian communions on the millions of Africa and Asia is pitifully weak." This scant harvest, he thinks, is not due to the infertility of the native soil; but "the most glaring weakness in the Christian forces, which, unless repaired, will defeat our efforts to win the world to Christ, is our disunion."

We may stop here to wish that the good bishop had a fuller vision, for the result of the total mission work is not "pitifully weak." Those words do not apply to a million Protestants and two million Catholics in India, not to speak of the changes working in Hinduism itself thru Christianity. Some hundreds of thousands of Christians in China, and as many in Korea, and this in so few year—Dr. Hepburn died only last week—is a very respectable harvest, notwithstanding "disunion."

The Bishop of the Philippines continues:

"By degrees the immorality of sectarianism, or of acquiescence in a broken order, is being brought home to us. Christ's work can be done only in Christ's way. An apostolate divided by internal strife could never have handed down the religion of Jesus to succeeding generations. Neither today can we Christians do effective work except as a Church that is at unity with itself. . . . The attempts to Christianize the nations of India, China, and Japan, first on the part of separate communions, frequently teaching contradictory doctrines about God's character and methods of dealing with men, and later in mild co-operation with one another, have been and will be, nationally speaking, futile."

"Futile" is a strong word to apply to the efforts that have gained these millions, even if they have not in a generation or two won for China and India what it took a thousand years to win for Europe. But that is not our present point. He demands union as the only chance of success. Now, there cannot be union with the Roman Catholic Church, and the Bishop knows it. A few years ago the Pope took this question up carefully, examined the Anglican succession, pronounced it broken and invalid, and shut and locked the door. There remain the so-called Protestant denominations of which the Bishop's Church is one. He speaks of "the immorality of sectarianism and of acquiescence in a broken order." Of course, sectarianism is bad, whoever is guilty of it. What he means by a "broken order" we do not know, unless it is the break in the orderly succession which the Vatican has declared to invalidate the Anglican Church, and which members of that Church like Bishop Brent find in the orders of non-Episcopal Churches. Now the fact is that sectarianism is a vice of no one Church, and we may look for the least of it in those churches which with the widest charity recognize all sister Churches. The note of sectarianism is its standing apart by itself and failing to show equal brotherly fellowship with other denominations of Christians. Further, the existence of denominations is bad, but by no means as fatal as the Bishop would tell us. The hundreds of thousands of converts of Anglican missions in South India are not lessened by the Baptist successes, which give hundreds of thousands of converts in Burma. What he calls "the mild co-operation" is an accepted comity, which generally prevents interference and promotes union. More than that, the last week brings us news of the meeting of delegates at a conference of the various mission Churches of all India to organize a federal union. Methodists, English Baptists, Presbyterians, Congregationalists, Disciples, Quakers, and nearly all others join in it, except the Anglican Church, the American Baptists, the Lutherans and the Dunkards. That shows where sectarianism is. The Bishop of Madras wrote that the Anglican Church could consent to no union or

federation except on the lines laid down in the Lambeth quadrilateral, which included the historic episcopate.

This separation of the denominations is an evil, a great evil, and it does stand in the way of missions, but the Churches are trying to come together, and those most guilty of "the immorality of sectarianism" are those who refuse to join in any union or federation. If Bishop Brent wants to get rid of this sin and this hindrance to missions we can tell him what to do. First, let him, in his own field, promote a harmonious federation with the Baptists, Methodists, Presbyterians and Congregationalists in the Philippine Islands—not with the Catholics, for they have refused him; and let him do this without tormenting himself and them with discussions of the "historic episcopate." Let him keep it for himself and rejoice in it, and then let him fraternize with those who haven't it and don't care for it. Next, let him do his best, for the sake of the speedy conversion of the world, to persuade his Church brethren here at home to ally themselves officially to the great Federal Council of Churches, which includes now nearly all the Protestant Churches in the country, except the Protestant-Episcopal Church, whose one purpose it is to bring sectarianism to a vanishing point. It is very sad that while the other Churches are burying their sectarianism, this strong and noble Church should remain apart, fellowshiping none, federating with none, and yet lamenting the lessening mote of sectarianism which it sees in the eyes of the other Christian bodies. Let Bishop Brent do this, and he will have taken the plain way of removing the evil which he so clearly knows to exist, but which he cannot so clearly locate.

**Sunrise in Philadelphia**

Philadelphia is to be congratulated upon returning to the forms and usages of popular government. While the State of New York is struggling to secure direct primaries, Philadelphia has in last Saturday's elections demonstrated the power that such a system of nomination may give the citizens of the most thoroly boss-ridden town of all. For weeks prior to the primary election an active canvass was carried on, not only by the reformers, but by those who sought the regular Republican nomination. Senator Penrose deemed it wise to offer the people a worthy choice for Mayor, and did so in the person of George H. Earle, Jr., banker and mender of broken trust companies. Usually the Republican nomination is equivalent to election, and Penrose's endorsement means nomination without a contest, but this time both the Senator and the candidates were obliged to work hard to get the right name on the ticket. This was partly due to the attitude of Mayor Reyburn, who boldly undertook to name William S. Vare as his own successor. But Vare, direct representative of the municipal-contractor idea in politics, lost in the primaries by 23,000 votes. There was a contest in the ranks of the Keystone or independent Republican party as well. This organization, along with the Democrats, has named Rudolph Blankenburg, whose name tells the story of his Bavarian birth. Mr. Blankenburg is in his seventies, remains hale and vigorous, and has battled for a generation in the cause of good government for Philadelphia. The city is fortunate in having these two nominees to choose from. Either of them would almost certainly acquit himself handsomely. Mr. Earle is independence itself in temperament; and the Penrose connection is less likely to disqualify him than the fact that he sleeps at Bryn Mawr, in the suburbs, and not in Philadelphia. His election would fitly illustrate the fact that even bosses are sometimes forced to name good men and sturdy men, tho they naturally prefer such cattle as are usually lodged in City Hall. But Mr. Blankenburg's election would constitute a much more notable triumph of good citizenship than the election of a Mayor put up by the boss.

**The Tattershall Castle**

To bring to this country a fine old book or picture from a European library or gallery is creditable and proper; for it will be as precious here as there, and it is a detachable and dividual movable; but a mantelpiece built for an ancient palace or castle, that fits it and will be out of place in a new mansion, is quite a different thing. If the building is to be torn down

it is proper enough to secure its contents for a museum, or even for an antique, archaicizing room in a new house. If the house must go its belongings should be saved. But to tear down an ancient English mansion and bring it over here, bricks, mantelpieces and all, and set it up in Long Island, as it was reported would be done, is a piece of crazy taste worse, if possible, than the vandalism of it. We do not know that this will be done, for the latest report that we have seen is that the bruit about it in the English papers was all a shrewd advertisement to get a big price for the Tattershall Castle from the excited and indignant British public. One story gave it that it was Mr. Hearst who had purchased the old mansion and would transport its bricks here and rebuild after the same old style. We hope not. It would deserve to be called "Hearst's Folly."

**Mr. Vardaman as Senator**

We suppose ex-Governor Vardaman will be elected United States Senator from Mississippi. He is utterly unfitted for the office, but there may be some satisfaction in the fact that his success proves the emergence to political power of the common people, as did the election of Tillman as Governor in South Carolina. Such a break-up may be good in the end, however disagreeable in the beginning. What some Mississippians think of him might be judged from a dramatic editorial in the Greenville *Democrat,* which quotes him as saying in a speech:

"When I get to Washington in 1913, and I am going there, too, with the aid of you bullies, I am going to raise the black flag."

*The Democrat* pictures him in the Senate chamber, walking up on the arm of John Sharp Williams to take the required oath. He returns to his seat, and as soon as the opening morning business is finished he rises and says:

"Mr. President: I want to tell you that the inertia which I observe to be prevailing here has got to come to an end, and I am the chap that is going to do it. You men from the North have had much to say about the nigger in the woodpile, but I tell you the nigger is in the Constitution, and that sacred instrument has no business to harbor the black devil. I propose to purge that instrument of the black obstruction fastened by Northern fanatics in its very bowels. I intend to give the Constitution a dose of oil and work the nigger out of it."

Hereupon the Vice-President interposes and most mildly suggests to him that there is nothing before the Senate except the member, that he must observe the rules, and if in his inexperience he does not know the rules he can get a copy. But Mr. Vardaman breaks in:

"Mr. President, I don't give a damn for your rules; the rules neither of God nor man bind me, and I shall certainly not be expected to regard the puny enactments of a lot of nigger-loving Yankees. No sir! I am here, as I told my people, my bullies, I would come, to raise the black flag and to demand the modification of the Fourteenth and the repeal of the Fifteenth Amendment to the Constitution; and you would do well to heed my words, for I say to you the nigger must go. They harbor the nigger, and the nigger has no rights a white man is bound to respect."

When he goes on to tell how the nigger smells, Senator Lodge, of Massachusetts, rises to protest against the Senate being converted into a stable, and moves that the sergeant at arms be directed to remove the nuisance from the chamber; and this is ordered without objection. Now notice that this is from a Democratic paper of Mississippi, which represents the best intelligence of the State.

**Religious Teaching to Boys**

Mr. A. C. Benson has lately been made Professor of Poetry at Cambridge University, and he is known as that one of the three sons of the late Archbishop of Canterbury who has given himself to literature and teaching. For fifteen years he was Master of Eton College, and he tells in *The Contemporary Review* his ill success in teaching religion, as required, to the Eton boys. He says he did not find it useful to teach much theology or dogmatics, and nothing of the ecclesiasticism of the Established Church. The ethics and the supernaturalism of the Old Testament could not be taught with satisfaction, and these he avoided, putting stress on the ethical and spiritual elements. But this is worthy of note and comment:

"There was plenty of a perfectly straightforward and non-contentious nature to teach, and I never deliberately enforced what I did not believe, tho I taught without comment

what I could not have affirmed; and this is, I imagine, the position of most schoolmasters." He says he never "enforced" what he did not believe, but he "taught" what he could not affirm; that is, he did not really believe. That does not look right, unless it be as one might be expected to require boys to commit a creed to memory, teaching it as a document; and even so it would seem a duty to give what one really does believe to boys who have past the age of Mother Goose and Saint Nicholas and are entering manhood.

**A Sibylline Leaf**

We take this well devised story of prediction by arithmancy from the *Annales*. A Norwegian, on his ninetieth birthday, was visited by William I of Germany while the latter was yet heir to the throne of Prussia. He asked the aged wizard, whose sunset of life had given him mystical lore, if he would ever be Emperor of Germany. "Yes," was the reply. "Then when?" The old man wrote down the date of the revolution of Prussia, 1849, as in the first column below, and then added the

| 1849 | 1871 | 1888 |
|---|---|---|
| 1 | 1 | 1 |
| 8 | 8 | 8 |
| 4 | 7 | 8 |
| 9 | 1 | 8 |
| 1871 | 1888 | 1913 |

separate figures, which gave him 1871, the year when William I was proclaimed Emperor of Germany in Versailles. He then asked the seer how long he should live. Again, as in the second column, the date of his accession as Emperor was written down and its digits added. They gave 1888, the actual year of his death. Once more William asked how long the empire would last. We think he must have been a Socialist, or at least a republican, for again the patriarch put down the last addition, 1888, and added to it its digits, and gained the answer 1913. We shall see, but history is making fast in these days, merging into revolution.

We wonder if it was wholly the cholera in Italy which was the reason why the Interparliamentary Peace Conference in Rome was postponed. We wonder if the Italian members knew that the war was coming, and that it would be very awkward to have a world's peace meeting while Italy was waging a most unjust war. What could have been more incongruous than such a meeting there and then, and how inconvenient it would have been for the members belonging to the Italian Parliament and the Italian Cabinet to meet their fellow members from England and Germany, and the United States, yes, and Turkey. It was just as well to put it off, and the excuse was quite as good as that given for declaring war.

Cardinal Gibbons is a good old man, one of the oldest of the Cardinals, and it is not surprising that he dreads the new measures of the Progressives. He had a perfect right in a sermon last Sunday to express his fear of the initiative, referendum and recall, even if they are political measures, for he thinks them dangerous to the state. But we regret that he trusts the chosen representatives of the people more than he does the people who choose them. Why is it not just as safe to get to the fountain of power, to those who are our real rulers, making sure of every opportunity to educate our rulers? He would "not disturb the political landmarks of the republic"; but that is a cry against progress. It is the good fearing the better.

Dr. Booker Washington could ride from Richmond to New Orleans as an interstate passenger and get as good a berth in a sleeping car as any one else; but when he proposed to make a lecturing tour in the huge State of Texas last month he was obliged either to sit up every night in a Jim Crow car or charter a sleeper for himself. The latter was what he did, for the health and comfort of himself and of the men of the same color who were his companions. If there is such a Jim Crow law it ought to be administered fairly, so that equal accommodations should be given to all who wish.

Magdalen College, Oxford, belongs to the diocese under the charge of the Bishop of Winchester, and the Rev. J. M. Thompson has been Dean of Divin-

ity, having it as his duty, under the license of the bishop, to give to the undergraduate members of the college, being members of the Church of England, religious and theological instruction. But he has published a book which casts doubt on the Virgin Birth and on the resurrection of the physical body of Jesus, doctrines taught in the creeds of the Church; and the bishop has, in a letter disclaiming any desire to limit freedom of discussion, withdrawn Mr. Thompson's license to teach theology to the students. His book will remain accessible to them.

Bishop Guerry, of South Carolina, proposes to please his negro Episcopalian communicants by giving them a suffragan bishop of their own color. He will be one of their own choice, but he will not be allowed to be a member of the diocesan council, all of whose members must be white. We are surprised that they would consent to take a bishop who could not have a bishop's full rights. Another case of negro rights comes up in Georgia, where the State Board of Examiners for Trained Nurses refuses certificates to negro applicants.

There are not a few who think gambling perfectly right. To condemn it is a sign of a developed conscience. Gambling is even yet encouraged at many church fairs, and the New York legislature has been at odds over the question whether to permit gambling at a horse race. But the most notable case that has lately come to light was mentioned in the Camorrist trial the other day in Italy, of a mayor who used to visit a gambling house, and would always take a priest with him, because he was afraid he might die gambling, which in fact he did.

The horrible catastrophe in Austin, Pa., is one of those which ought not to be possible. It is possible to make dams that will not slide or break, and otherwise it is better to do without them. The Johnstown disaster of 1889 ought to have been a lesson. And we have every day the record of people killed by trains at grade crossings, another danger that should be made impossible and can be with money. We must eliminate these murderous life-traps.

Under the new Greek Constitution it is forbidden to issue or circulate in that country any translation of the Bible into modern Greek. This applies even to the Old Testament, written originally in Hebrew, so that only the old Septuagint is accessible, and that only to scholars, for the old Greek is not understood by the common people. Thus the conceit of Hellenism excludes the knowledge which was the aim and boast of genuine Hellenism.

The story is told of sixty revolutionists shot in Lower California by the Governor of the Province. Twenty prisoners were told they were to be shot. An officer shaved his head and disguised himself as a priest and heard their confessions, which implicated forty others in a plot. Thereupon the forty were arrested and the whole sixty summarily executed. That pretended priest deserved to be shot sixty times over.

President Butler, on his return from Europe, says that the failure of the Senate to ratify the Arbitration treaties has injured the reputation of our country abroad. Nothing less was to be expected, but there will be a chance for the Senate to retrieve itself. Possibly to save its face it can add an insignificant amendment which Great Britain and France can accept.

In a primary election in Coatesville, Pa., last Saturday, Charles E. Umsted, chief of police, who is under indictment for manslaughter because of neglect to protect the negro burned by a Coatesville mob, received 600 of the 980 Republican votes for high constable. Tell it not in Charleston; publish it not in the streets of Atlanta, lest the daughters of the Caucasians rejoice, lest the Daughters of the Confederacy triumph.

Prof. A. L. Guérard, of Stanford University, asks in the *Popular Science Monthly* why we should not have a Simplified Pronouncing Board as well as a Simplified Spelling Board? Why not?

# Insurance

## Against Fire Waste

A CONCERTED effort is to be made by the State of Minnesota to reduce its abnormal fire waste. This State has been conspicuous for its heavy losses, even in the recent years when fire losses have been exceptionally heavy in all sections. Many companies have retired from Minnesota as an unprofitable field. To meet this situation the Governor of the State has issued a proclamation asking the citizens to assemble in mass meeting at St. Paul, on November 8, to assist in carrying out plans to prevent this fire waste. The Governor admits in his proclamation that the fire waste is increasing year by year and becoming more and more appalling in the State of Minnesota. Movements in a similar direction are noticeable in other Western States, by the appointment of fire marshals and frequent official appeals to the people.

The fire marshal of Ohio reports that under the authority of law he has within a short period destroyed 1,065 buildings of the fire-trap class in the congested districts of the six principal cities, and thus removed the cause of possible great fires spreading over extensive areas. He has found very little opposition from the owners of such property when its hazardous character has been fully explained to them. It is everywhere evident that the citizens need only to be aroused to appreciate the value of their efforts to reduce the waste that is such a serious menace to the prosperity of this country.

IN connection with the recent retirement of a fire insurance company an investigation was made into the permanency of stock and mutual companies. The summary shows that of 158 stock companies organized between 1835 and 1900 the number of retirements, reinsurances or failures was 126. Since 1859 only one purely mutual life insurance company has failed, and its dissolution was attributed to an attempt to take over a disabled stock company. The total capital stock of life insurance companies organized between 1835 and 1900 was $16,553,054. The tremendous development in the organization of local life companies since the Armstrong investigation is shown by the fact that the total capital stock of companies organized in the last five years—1906 to 1910 inclusive—is $77,501,288. Most of these new companies have been operating since organization under an average expense ratio to total premiums of over 50 per cent., as compared with an average of less than 20 per cent. for the older companies for the corresponding years immediately after their organization, due to the very different conditions which then existed.

THE life insurance companies are interested in the case of G. A. Kimmel, of Niles, Mich., who, mourned by relatives and friends as dead for thirteen years, has returned, after spending most of the thirteen years in the penitentiary at Auburn, N. Y. All of his friends and relatives claim that he is the same George Kimmel that mysteriously disappeared in 1898 but his mother, who says that he is an impostor. His mother obtained judgment against one life insurance company in 1905 on a policy for $5,000. Another company, carrying a policy for $20,000, refused payment, and later convinced the courts that Kimmel was in Auburn.

THE resignation of Hugh Rankin as secretary for the Continental and Fidelity-Phenix insurance companies is announced. Mr. Rankin is to go to the Rhode Island Hospital Trust Company, of Providence. He is succeeded by Ernest Sturm, who has been with the Continental since 1892, first as office boy, from which position he advanced to that of cashier.

LIABILITY insurance was taken out to cover the aviation meet at Nassau boulevard last week by the directors. The policy was for $150,000 and the premium $1,500. Only the public liability is covered and the policy was placed with Lloyds, of London.

# Financial

## Active Stock Market

The course of the market for securities last week was marked by violent fluctuations and much excitement, due mainly to official utterances concerning the prosecution of trust combinations and to a great volume of transactions in the stock of the Steel Corporation. Business on the Stock Exchange for the week amounted to 6,675,600 shares, against 4,810,600 in the week preceding, and the sales on Wednesday (1,726,600 shares) exceeded those of any other day since March, 1907. Rumors as to the purpose of the Government with respect to the Steel Corporation, with reports of impending reduction of wages in the steel industry, depressed prices in the early days of the week. A carefully written statement from Attorney-General Wickersham was not regarded as sufficiently definite and had but little effect. At a late hour on Tuesday night, however, a statement in behalf of the Steel Corporation was given to the public by J. Pierpont Morgan and Judge Gary. It had been authorized by unanimous vote of the directors, and it said at the beginning that there had been "no negotiations whatever with the Department of Justice looking to a dissolution or disintegration of the company." The remainder was as follows:

"The corporation was organized for business reasons and purchased its various plants to promote such business and not to restrain trade or obtain a monopoly. In all its operations the company has scrupulously observed the law and recognized the just rights of its competitors and the consumers of his products. So far as its directors are aware, no complaint has ever been made against it by either of these interests. The directors are advised by its counsel that its existence is not in violation of the Sherman act as interpreted in the recent decisions of the Supreme Court.

"In view of this record and this advice the directors feel that their duty to their stockholders, their employees, and the public requires that they should set at rest all rumors to the effect that they are contemplating any voluntary dissolution or disintegration of the corporation or have any belief that it is subject to such dissolution or disintegration by legal action. We believe that the organization is legal, and that its management is proper. Its properties are of immense intrinsic value and the corporation is of benefit to the public interests."

On Wednesday there was a sharp advance, with large transactions, followed by decline and irregularity. Much weight was given to the statement, but there was still some uncertainty, it was thought, as to the Government's course. During the remainder of the week the market was affected in some measure by Italy's war with Turkey and by the strike on the Harriman railroads. Mr Taft's speech at Waterloo was reassuring. At the close on Saturday, the market was strong at an advance. The week's net changes for leading or representative securities are shown below:

| Shares. | Stocks. | Net change. |
|---|---|---|
| 230,700 | Amalg. Copper | +2 |
| 239,100 | Amer. Smelting | +4¾ |
| 103,500 | Atchison | + 5/8 |
| 24,800 | Balt. & Ohio | —1 |
| 48,600 | Canad. Pac | — 7/8 |
| 146,000 | St. Paul | —2⅞ |
| 54,200 | Erie | — 7/8 |
| 35,600 | Gt. North. | +1 |
| 4,500 | Int. Harvester | +1⅝ |
| 132,600 | Lehigh Valley | +2 |
| 37,800 | Mo. Pac | + ½ |
| 36,800 | N. Y. Centr. | +1⅜ |
| 53,250 | North Pac. | +1¾ |
| 36,800 | Pennsylvania | + ¾ |
| 703,600 | Reading | + ⅜ |
| 88,600 | South Pac. | +1¾ |
| 1,155,800 | Union Pac. | + ⅜ |
| 2,639,500 | U. S. Steel | +5⅜ |
| 67,700 | U. S. pref. | +5 |

Saturday's closing prices ranged from 2 to 10 points above the lowest figures of the week, the advances from the bottom in Steel, Union Pacific and Reading (in whose shares 69 per cent. of the business was done) having been, respectively, 10, 6⅝ and 5½ points. In general trade there was no disturbance like that which was seen in the securities market, but transactions were marked by caution and conservatism.

....A Western railroad officer says that local passenger business has been affected in the country districts by automobiles. The effect is noticed in Nebraska, where the automobiles owned are at the average rate of one for about 128 inhabitants.

## Survey of the World

**At Washington**

At his own request (according to Secretary Wilson) George B. McCabe, solicitor of the Department, and until recently dominating spirit in the enforcement of the pure food law, is relieved from further service on the board. Dr. F. L. Dunlap, the associate chemist, who, according to the Wiley adherents, worked for Dr. Wiley's downfall, is given a long leave of absence. Dr. Wiley, the only remaining member of the pure food inspection board, is reinforced by the appointment of R. E. Doolittle, chief of the bureau of chemistry laboratory in New York City. Until Congress adopts another statute creating a new agency to enforce the act the decisions of Messrs. Wiley and Doolittle will govern in the matter of enforcement of the pure food and drugs act, subject, of course, to approval by the Secretary of Agriculture. Solicitor McCabe is regarded by friends of Dr. Wiley as the arch enemy, and there have been demands that he should be dismist or "permitted to resign." Secretary Wilson none the less expresses confidence in the solicitor, who remains a factor in the affairs of the Department,——The selection of Charles D. Hilles as chairman of the Republican National Committee is prophesied at Washington.

**Mr. Taft**

Speaking on the lines of his Detroit and Waterloo addresses, the President told the Chamber of Commerce at Pocatello, Idaho, October 6, that, when a court is doing its duty, trying to interpret the law, and is "condemned and attacked and its motive questioned for mere political purposes," he "resents it with deep indignation." He said he had received many criticisms on the point, but as yet he had failed to receive an answer to his challenge to W. J. Bryan and other publicists to cite a single case of restraint of trade which ought to be condemned under the Supreme Court's interpretation of the anti-trust law in the Standard Oil and the Tobacco Trust cases. Mr. Taft referred to the Supreme Court's disposal of the Standard Oil and Tobacco cases as "two great decisions." He continued:

> "I believe we are going on to a greater future. If we had allowed these combinations to go on and develop the only remedy would have been to change by force the power thus concentrated in the hands of a few individuals to the State, and then we should have had a State socialism. It was the inevitable result of the movement toward trusts unless broken up.
>
> "Now we can get back to competition. We must get back to competition as an element in this country. If it is impossible, then let us go to socialism, for there is no way between. I for one, am not discouraged as yet in the hope that we may return to a legitimate and independent competition. I am an individualist and not a Socialist."

On Saturday the President entered the State of Washington. From Seattle he will go on to Bremerton, to visit the Navy Yard, and to San Francisco.——The President was cordially cheered at the Mormon Tabernacle in Salt Lake City last week. It was old folks' reunion week, and the Tabernacle was filled to its capacity of 12,000. The President spoke to the Mormons on peace. Senator Smoot, of Utah, who sat next to him in the high Tabernacle pulpit, told Mr. Taft after the speech that he would support the arbitration treaties in the amended form to which he has given his consent—that is, that the Senate shall be

given the power of confirmation over the appointments to the joint high commission.——In Wyoming the President was treated to a sight of frontier day "stunts," performed out of season for his edification.——At Denver, Col., the President spoke twice: on the tariff and on conservation. The second speech was addressed to 12,000 persons, mostly anti-conservationists, with whom the President frankly confessed disagreement. He said:

"I am the President of the whole people and what I am trying to do is to get you together. It isn't talk, it isn't abuse, it isn't muckraking that accomplishes anything. It is getting on that counts. It is the real development of the country that we are after."

Mr. Taft began by admitting that the attitude of the extreme conservationists was unreasonable. "For a time," he said, "when a man held out against conservation he was accused of being prompted either by the devil or the corporations." At these words the audience cheered him wildly. The President continued, however, and said that he wished to secure for the West the right of an appeal in land cases from the decisions of the Interior Department, as is allowed in patent cases from the decision of the Commissioner of Patents. As a solution of the water power site controversy he put forward the suggestion that the Federal Government should turn the water power sites over to the State Governments as is wished generally in the West, and then place upon the State Governments such restrictions in the disposal or use of the water power sites as will carry out the desires of the conservationists. In case the State Governments did not carry out the mandate of the Federal Government, he said, the title to the power site could revert to the Federal Government. The delegates to the convention had registered themselves as utterly opposed to the proposition of disposing of public mining lands under Government lease. The President told them that he favored leasing and that their ideas on the leasing question were wrong. The Westerners claim that if the mining lands are only leased capital would be afraid to invest in them. The President asserted that was not so and pointed out the success with which the leasing scheme has been attended in other countries.——In Nebraska, according to the correspondent of the Chicago *Tribune*, the number of persons who have testified to a change of opinion as a result of hearing the President is somewhat striking. At Lincoln, Neb., Mr. Taft lunched in company with William Jennings Bryan. The latter begged the banqueters to fill their glasses

"with the beverage upon which the Almighty has set the seal of His approval and drink a toast to President Taft"

**Direct Primaries in New York**

Before the New York Legislature adjourned, October 6, it passed the Ferris-Blauvelt direct nomination bill. Governor Dix exprest himself as gratified at the fulfillment of platform pledges. The primary bill which now becomes a law in New York State was opposed by every Republican Assemblyman. The leader of the Republican minority, Mr. Merritt, charged that this bill gave Tammany a stranglehold upon the Democratic State organization. The new law provides for the direct nomination of all party candidates for public office except those to be voted for by the voters of the entire State, and town, ward and village officers, including school directors. By this law candidates for Governor and State Treasurer, etc., must be nominated by conventions, as now. Friends of the direct uniform primaries system regard the passage of the law as a step in the right direction, altho much less radical than what was wanted by Governor Hughes.

**The Stephenson Inquiry**

The Senatorial inquiry into Senator Isaac Stephenson's campaign for the primary election in 1908 indicates that payments were made to his workers without any definite report being made as to their disposition of funds. Out of his campaign fund of $107,793 money was scattered broadcast over the State of Wisconsin to "organizers." Witnesses for the senior Senator from Wisconsin testified that this sum was used legitimately for brass bands, lithographs, buttons, advertising, and "getting out the vote." The campaign manager, E. A. Edmonds, said that the

"thoroness" of his campaign explained its costliness. In some counties, the expense amounted to $5 a vote. Rodney Sackett, another Stephenson worker, declared on the stand that the 1908 primary campaign was run on a higher moral plane than the average canvass in Wisconsin. He said that Senator Stephenson ordered him not to make the campaign a saloon campaign, and went on to say that it was customary to send kegs of beer around where there were voters congregated. He said this was not done in this campaign but that there were instances where men were treated to meals, drinks, cigars, etc., to win their votes. Sackett said that this was not bribery; it was bribery only when gifts that could be taken away were given.

Floods

Black River Falls, a town of 2,000 inhabitants, near La Crosse, Wis., was swept by a flood October 6, when the waters of the Black River, swollen by recent rains, washed thru the embankment of the La Crosse Water Power Company's dams at Hatfield. The dam was of concrete, 60 feet high. It was considered strong enough to hold any flood, but its crumbling followed the breaking of another dam, 18 miles above, which increased the floods productive of the disaster. Eight hundred feet of the Green Bay & Western Railroad tracks at Hatfield were washed out and traffic was interrupted. Several farm houses floated down stream and water to a depth of 11 feet poured over the top of the dam and tore away the bridge at Black River Falls.——Two dams broke at Chippewa Falls, Wis., on the same day, and one at Bloomer, Wis. The countryside was flooded in consequence, railway tracks washed out and bridges destroyed. Damage from floods was reported also from St. Paul, Minn., and various points in Iowa.——The number of lives lost in the disaster at Austin, Pa., remains in doubt. The cause was inadequate foundations and reinforcement. Over a year ago the dam moved a foot down stream, and cracks were discovered in its surface. The dam cost only $75,000 in the first place.——When the Red Cross Society visited Austin, its representative found the situation so "admirably in hand" that no assistance was required. Wreckage is being removed, standing houses weakened by the flood being destroyed. The State Constabulary has arrested a number of looters. Kathleen Lyon, the sixteen year old telephone operator, who saved many lives by warning subscribers down the flood-swept valley, has been placed on double pay by her employers. Another telephone girl will probably receive the same reward for like heroism. The Pennsylvania Water Supply Commission wishes to have a law enacted placing under its jurisdiction all dams or obstructions placed in streams, whether or not public thorofares.

Strikes

The strike of the Chicago shopmen of the Illinois Central Railroad continues. Railway men declare that a large number of the strikers have returned to their places, but this is denied by union leaders. Hope that the strike might be concluded by arbitration was abandoned when President Markham of the railroad telegraphed Governor Noel, of Mississippi, who suggested arbitration, refusing to consider that course.——It is in the South that this strike of the Harriman lines has reached its most violent form. Battles have occurred between strikers and strikebreakers at McComb City, Miss., a division point of the Illinois Central Railroad, and at New Orleans. A regiment of State militia was called out before the disorder was suppressed. Machine guns were mounted in an armored turret over the railway sheds, and the fence around the sheds at McComb City has been barricaded with barbed wire and patrolled by armed guards. This strike was marked by serious violence from the beginning, trestles being burned, passenger trains stopped by armed mobs, and non-striking railway employees roughly handled.——The Illinois Central secured injunctions from the Federal court sitting at Cairo, Ill., restraining strikers from interfering with men at work. Similar temporary injunctions were issued in the United States Court sitting at New Orleans in favor of the Southern Pacific Railway Company; and also at Houston and Sherman, Tex.——The strike of the firemen on the Georgia and Florida

Railroad is settled. The men will get 50 per cent of engineers' pay, as demanded.——It was announced that the trial of John J. McNamara and his brother James, at Los Angeles, Cal., would begin October 11. Informal motion for a change of trial judge presented by the attorneys for the defense was denied October 7.

**Canada**

The Laurier ministry went out of office October 6. Mr. Borden was immediately summoned by the Governor-General, Earl Grey, and accepted the invitation to form a cabinet. The make-up of the Ministry was to be announced Monday; unofficial reports had it that the geographical distribution of portfolios would be as follows: Maritime Provinces, R. L. Borden and J. D. Hazen; Quebec, F. D. Monk, L. P. Pelletier, W. B. Nantel, George H. Perley and C. J. Doherty; Ontario, Frank Cochrane, W. T. White, George E. Foster, W. S. Middlebro, Andrew Broder and J. E. Armstrong; the West, Robert Rogers, Dr. W. J. Roche and Martin Burrell. ——The failure of the 1911 crop of "quality wheat" is indicated by official reports to the Department of Trade and Commerce by the Government's chief inspector of grain at Winnipeg, whose detailed report of the inspection of 10,000 cars, of 1,075 bushels, for the month of September, shows a heavy decrease in the high exportable grades and heavy increases in the low grades. There were only 1,056 cars of "No. 1 Northern," compared with 2,421 cars in September, 1910; 4,102 cars "No. 2 Northern," compared with 4,614 cars in September, 1910, 2,354 cars "No. 3 Northern," compared with 2,775 cars in September, 1910; 585 cars "No. 4 commercial grade," compared with 569 cars in September, 1910, and 961 cars "rejected," compared with 178 cars in September, 1910. Department officials say the report indicates a vast surplus of non-exportable wheat.

**Cuba and Other Islands**

In a duel, on the 7th, between Major Andre, of Havana, owner of the newspaper *El Dia*, and Dr. Mencia, Cuba's Director of Customs, the latter was severely wounded. He had challenged Andre because of published charges that there had been gross frauds in the customs service.——It has been ascertained that the after part of the "Maine" wreck, about one-third of the ship, can be floated and thus removed from the harbor.——According to a story told in one of the Havana newspapers, the bomb used in destroying the building of the Los Angeles *Times* had been made by an anarchist for use in Tampa, Fla., during the cigarmakers' strike there. The anarchist, it is said, afterward went to Peru and is now employed in the Panama Canal Zone.——The sugar crop soon to be harvested in Santo Domingo will be the largest ever known there, and it will be sold at high prices.——Parts of Hayti are suffering by reason of floods, due to rains which continued for eight days. Earthquake shocks were felt on the 6th in several towns.——Sailors who recently arrived at San Francisco from Alaska report that the activity of the Bogoslof volcano has added four new islands to the Aleutian archipelago.——It is expected that the Government of the Philippines will be subjected to investigation by the House Democrats at the coming session of Congress.——The army in the Philippines is preparing to pursue the Moro outlaws of Mindanao and to suppress brigandage in that island.

**Panama's Politics**

Dr. Belisario Porras, Panama's Minister at Washington, was recalled by President Arosemena, on the 7th, following a meeting of the Cabinet at which all but one of the members voted for such action. It was said that his service had not been satisfactory to the Government. President Arosemena is to be a candidate for re-election, and Dr. Porras will probably be the candidate of the opposing party. He says that at Washington he has been surrounded by spies acting in the interest of Arosemena; that one of them, named Battalla, a close friend of Arosemena, was sent to be his attaché and has acknowledged in a letter his employment as a spy; that Battalla and one Ossa, the Minister's private secretary, have returned to Panama

with reports to be used against him; that he is attacked because he recently married a resident of Costa Rica, whose boundary dispute with Panama has not yet been settled, and also because he offered a small island to the United States for a coaling station. On the other hand it is asserted that Battalla was Porras's intimate friend and was appointed at his request; that Battalla wrote letters attacking Arosemena, and that Porras had promised, if he should be elected President, to place the police force in American hands and establish American colonies. Arosemena gives notice that he shall take a vacation of six months, in order that he may be a candidate without defying the Constitution. As many hold this to be an illegal evasion of the Constitution, it is thought that Arosemena's course may provoke a revolution, and our Government has the matter under observation.——By President Taft's order, a postal savings bank is to be established in the Canal Zone, but no interest on deposits will be paid.——President Diaz has sent to Nicaragua's Congress a contract for a loan to be procured from bankers in New York, recommending the acceptance of it, with some modifications.

**The Situation in Mexico**

Nine-tenths of the votes cast at the election in Mexico were for Madero, but it is not yet known who will be Vice-President, Governor Suarez, Dr. Francisco Gomez and President De la Barra having about the same number of electors. It is reported that Dr. Gomez and De la Barra have agreed to a union of their electors in favor of the former, because the election of De la Barra would disqualify him for the Presidency six years hence, when he hopes to succeed Madero. He will soon go to Italy, and remain there for several months. Madero asked Dr. Gomez, last week, to withdraw in favor of Suarez, but he refused to do so. It may be necessary for Congress to elect a Vice-President. There was scarcely any disorder at the election. In Tehuantepec a clash between factions required the intervention of the army, and seven men were killed.

General Bernardo Reyes arrived on the seventh in San Antonio, which will be his home for some time to come. Enrique Creel has recently been there, and another resident is Emilio Gomez, the Presidential candidate of a small party. Reports were published at the capital last week that Reyes, in alliance with the Diaz cientificos, and possibly with the Magonists, would establish a junta there and promote a new revolution, which would begin before December. Reyes says there is no truth in these stories. But he speaks with much bitterness of Madero, who, he says, has originated a new tyranny and made a free ballot in Mexico impossible. His revolution, Reyes continues, was a farce and an insult to the people, and his party's power is maintained by armed forces. Arms recently smuggled across the border and others brought in at Vera Cruz have been captured by the Maderists, who, it is said, have found hidden stores of arms in the capital and unearthed a plot for an uprising on October 15. Five men have been placed in jail at the capital for planning the assassination of General Orozco. ——In a battle at Santa Barbara, on the 2d, 800 Zapatists were routed. On the 6th, in the State of Guerrero, General Figueroa captured 200 of Zapata's men. Amnesty has been promised to others, and Zapata's power is broken. There are local rebellions in Chiapas and Sonora. ——Sir Weetman Pearson (Lord Cowdray) has reached an understanding with Madero, according to a statement ascribed to Dr. Hayes, a prominent officer of our Geological Survey, who has resigned to enter the Pearson service. It is asserted that the valuable Pearson oil properties and franchises will be as safe as they were under Diaz.

**South America**

The State Department at Washington has ascertained that Cipriano Castro, formerly President of Venezuela, who left his home in Europe some months ago, is on an island off the coast of Colombia. A revolt in the Venezuelan State of Tahira is reported, and it is said to be in the interest of General José Hernandez, formerly Minister at Washington.——Colonel Jara, who seized the Presidency of Paraguay some time ago, and was soon deposed and sent to

Buenos Ayres, was seen again at Paraguay's capital last week, arrested, and taken before President Rojas. He admitted that an uprising against Rojas had been planned by his friends, who were using $70,000 which he had won on the race track in Buenos Ayres. He was placed on board a ship bound for that city.——It was reported last week that Bolivia was concentrating troops on the frontier, near territory in dispute between that country and Paraguay.——In Bogota, the capital of Colombia, on the 7th, a mob attacked the Peruvian Legation and tore down its shield. This action was due to the reported refusal of Peru to evacuate a port on the Putumayo River recently occupied by Peruvian troops and situated in territory claimed by Colombia. It is said that the indignation of the mob had been excited by an address in the Cathedral by the Archbishop of Bogota. A similar attack upon the same Legation was made in July. On the 8th, the Peruvian Government sent to the Colombian Government an energetic note of protest and instructed its Minister at Bogota to demand full satisfaction.——In Ecuador, at Guayaquil and elsewhere, there were earthquake shocks on the 4th. In Riobamba there were processions of frightened people, imploring Divine protection.

**The Turco-Italian War**

The new Turkish Cabinet has as its Grand Vizier Said Pasha; as Minister of Foreign Affairs, Rechid Pasha, Ambassador at Vienna; and as Minister of War, Sheuket Pasha; who led the army of the Young Turks into Constantinople. The Government has decided to expel all Italians in Turkey within three days and to increase the tariff on Italian imports 1 per cent. It has been suggested that Turkey would be willing to agree to the annexation of Tripoli by Italy if the Italian colonies in Africa, Eritria and Somaliland are ceded to Turkey in exchange. None of the Powers has shown any disposition to intervene in response to the appeal of Turkey, and it appears to have been understood in advance that no such action would be taken until the Italian occupation of Tripoli is effected. Every effort will be made to confine the war to that country, for fear of precipitating a general scramble for Turkish territory and a European war. Already, however, two incidents have occurred which show how difficult it is to keep from involving European Turkey; these are the bombardments of Prevesa and Medua. No landing in force was made at Prevesa as was reported, but a lieutenant was sent ashore disguised as a peasant to see if Turkish torpedo boats were in the harbor. Climbing a mountain overlooking the town he discovered with a telescope that they were still there, and a report to that effect was sent to the Duke of the Abruzzi, commandant of the fleet. Captain Biscaretti opened fire at five miles on the Turkish vessels, and their panic-stricken crews deserted the ships and jumped into the sea. Then he boldly entered the harbor with the torpedo-boat destroyer "Corazziere," under the guns of the fortifications, and captured a Turkish yacht at anchor there. While towing this out the marines who had left the torpedo boats fired from the docks, and the "Corazziere" replied with a volley of shot and shell, destroying several houses and killing many. Altho the Italian destroyer was forty minutes in the harbor not a shot was fired from the shore batteries. A few days later Captain Biscaretti stopped an Austrian mail steamer off the Albanian coast near Point Medua. When the boat with which he had boarded the steamer was returning to the destroyer the white flag was blown away and the Turkish soldiers fired upon the boat from the cliff. The two destroyers returned the fire and demolished the Turkish batteries and barracks, killing and wounding a large number of men. The engagement lasted more than half an hour, and not less than 200 shots were exchanged. There were no losses on the Italian side.——The Arabian rebels of the Yemen, against whom the Ottoman Government has for years waged war in vain, have declared a truce and proffered the services of 100,000 men to fight the Italians.——Two steamships bearing some 1,500 Turkish troops to Constantinople have been stopped in the Gulf of Suez because of cholera on board. Two Turkish gun-

boats in Suez harbor have been ordered by the Egyptian Government to surrender their guns and ammunition. Early on the 8th an Italian squadron appeared before Tobruk, on the coast of Barca, east of the Gulf of Bomba, and captured it after a brief bombardment.

**The Capture of Tripoli**

The time allowed by the admiral of the Italian fleet for the surrender of the city of Tripoli expired at 2 p. m. on Tuesday, October 3, and, the Turkish commander not having availed himself of the opportunity, the bombardment began within an hour. The entire Italian fleet first made a final demonstration of its strength by defiling slowly past the water front of the city and then drew up in battle array, the twelve larger warships in a wide semicircle stretching from point to point about two miles out, with the flagship, "Benedetto Brin," on the right wing. In front were torpedo boats and destroyers and behind other vessels cruised to guard against the Turkish torpedo boats at large in the vicinity. A boat full of spectators from Tunis, who came out to see the bombardment, was kept at a distance of ten miles and the newspaper correspondents on the Italian warships were not allowed to send back their despatches with the exception of G. Di Felice Guiffrida, who by asserting his prerogative as a Deputy was able to get his account of the engagement taken to Malta by a gunboat. The censorship by the Italian authorities has been astonishingly effective and very little news has been received from Africa or Italy except with official approval. On the morning of the 4th the bombardment was renewed and continued at intervals all day, as methodically and coolly as tho it were target practice; the gunners making bets with each other on the effect of their shots. The fire was directed at the Sultanic battery on the west of the city and Hamidie battery to the east, for the Italians desired to do as little damage as possible to property that would shortly be theirs. Private houses were avoided and the Arabs crowding the minarets watched the bombardment with impunity. A lighthouse was hit and demolished, but this was because it stood close to one of the batteries. The Turks returned the fire with vigor, but their cannon were antiquated and their ammunition deficient, so they did no damage to the attacking fleet. The Italian vessels were able to run in close enough to use their smaller guns and still keep out of range of the Turkish fire. By the morning of the 5th the fortifications were in ruins and the garrison retired to the hills a few miles inland. Twelve Turks were killed and twenty-three wounded during the bombardment. The landing was made without opposition and the Italian Government established. Vice Admiral Borea d'Olmo, who had been appointed in advance Governor of Tripoli, issued a proclamation declaring the city under martial law. The inhabitants, who had fled from the city during the bombardment, have returned, the markets are open and caravans from the desert coming in. The first transports from Italy have arrived conveying to Africa the army of occupation under Captain Cagni, who was with the Duke of the Abruzzi on his polar expedition. The other towns on the coast of Tripoli and Cyrenaica were occupied at the same time as the capital, as they had insignificant garrisons. At Bangazi there were a few hundred Turkish soldiers; at Derna seventy, but Cyrene was guarded by twenty policemen. It is the announced intention of the Italian Government to land a sufficient force to march into the interior and conquer the whole country within a short time. Then only will it consent to discuss terms of peace with Turkey.——The Governor of Tripoli has issued a proclamation putting a stop to the slave trade, which has been particularly profitable to Tripoli since the closing of other seaports to the trade thru Christian occupation. Mgr. Rossetti, the Apostolic Delegate at Tripoli, sent a wireless message to the Pope rejoicing that the cross of Christianity had been raised over the country for the first time since the Knights of Malta were defeated by the Turks in 1551; and the Pope returned a wireless blessing with a message praising the Delegate and the Franciscan monks and nuns for remaining in Tripoli during the bombardment to care for the wounded.

**Royalist Rising in Portugal**

The long expected raid of the Royalists into northern Portugal from Spain took place on October 4, but the details of the movement are still in the dark and the outcome of it uncertain. Reports thru various channels give diverse estimates of the number of the invaders, ranging from 700 to 30,000. Probably the semi-official report of 1,200 is not far from the truth. They are said to have twelve cannon. The frontier was crossed by the Royalists near Vinhaes and several villages in the vicinity of Braganza were occupied without, however, capturing that city. Later the Republican troops reoccupied Vinhaes and cut off part of the Royalists. Others escaped to cross the frontier into Spain. The Government has 8,000 troops in northern Portugal supported by gunboats and transports on the rivers. The invaders do not seem to have received the support they expected from the people of Portugal and the number of Monarchists willing to ally themselves with the rebellion was not much greater than the number that crossed the border. The action of the Government in seizing the conspirators in Oporto a few days before the invasion put a decided check upon the Royalist movement inside the country. According to the plan the invasion and the rising were to take place simultaneously on October 5, the anniversary of the overthrow of Manuel. Proclamations announcing the restoration of the monarchy at that date had been already printed. It is uncertain how large a share ex-King Manuel has in the movement. Its chief support seems to come not from him but from the pretender, Dom Miguel of Braganza. Prince Francis Joseph, son of Dom Miguel, is said to be with Captain Couceiro, the leader of the Royalists on the northern border. Dom Miguel has publicly exprest his willingness to leave the choice between himself and Manuel to the Cortes as soon as the republic is overthrown.

**Foreign Notes**

The Irish railroad strike, which began September 21, was settled on October 4 by an agreement between the Amalgamated Society of Railway Servants and the companies. The strikers abandoned their contention that they should not be compelled to handle lumber shipped by firms having trouble with their men. The companies agreed to reinstate 90 per cent. of the strikebreakers at once and the remaining 10 per cent. when vacanies should occur, but refused to discharge the new men taken on during the strike.——Mr. Balfour, leader of the Opposition, in a speech at Haddington, Scotland, gave more prominence to the tariff question as a party issue than to home rule. He gave no encouragement to the Unionists of Ulster, who declared they will take up arms rather than submit to a home rule government. The Canadian election has evidently strengthened his belief in a preferential imperial tariff, and his declaration on this point should be quoted verbally:

"The Canadian decision extended far beyond the borders of Canada, and must have beneficial results for the empire at large. The decision of Canada shows how impossible it is to maintain the present system of things. Our colonies are not believers in the system spoken of as free trade. Unless this country meets the situation we shall have Canada, Australia, New Zealand and other great communities making their separate commercial tariffs with other countries. This country will awake some fine morning to find that these great communities, loyal as they are, have instituted a system of tariffs in which we will find ourselves at a disadvantage. Such a state of affairs must have a fatal effect upon the unity of the British Empire."

——The labor disturbances in Spain have ceased and Premier Canelejas has restored the constitutional guarantees to the cities which had been declared in a state of siege.——The Spanish troops in the neighborhood of Melilla, Morocco, have had a fight with the Moorish tribesmen lasting ten hours. The Spanish were victorious, but lost about 100 killed and wounded.——During a session of the Reichsrath in Vienna, a Dalmatian workingman in the gallery fired four shots at the Minister of Justice. No one was hit. The assailant is a Socialist, who was inflamed by the recent demonstrations against the high cost of living. ——The Japanese Government has made an announcement of its naval policy. It will recommend the appropriation of $175,000,000 for the construction of new vessels within the next seven years. The greater part of this will be used in building seven Dreadnoughts and two armored cruisers.

# Italian Interests in Tripoli

## By Richard Gottheil

[The author of this article is professor of Semitic languages at Columbia University and head of the Oriental department of the New York Public Library. He has traveled and studied in Europe and Asia Minor; was in charge of the American School of Archeology at Jerusalem in 1910, and is a member of many learned societies.—EDITOR]

THE practical seizure by Germany of the closed Moroccan port of Agadir a few months ago was bound to find imitators. In fact, this newest form of diplomacy, if it can be dignified by such a name, dates from the year 1908, when Bulgaria threw off her Ottoman suzerainty and filched a portion of a Turkish railway, and when Austria-Hungary relieved itself of Turkish overlordship in the Sandjaks of Bosnia and Herzegovina.

The latest example of this diplomacy is the forcible taking of the Tripolitan coast by Italy. Modern history can hardly show a worse example of high-handed action and of a wilful disregard for all the elements of fair play. That Italy was growing restive at the further partition of Northern Africa at the hands of France, Spain, and Germany was quite evident. The Italian newspapers spoke quite openly of some "compensation" being due to Italy as one of the Mediterranean Powers. There were some rather mysterious and prolonged conferences at Anticoli, a little watering place not far from Rome, between Signor Giolitti, the Premier, and the Marchese di San Giuliano, the Minister for Foreign Affairs. In fact, at the very beginning of September the *Giornale d'Italia* hinted plainly that some action on Italy's part was in the wind; and the extensive character of the operations now going on show that they must have been planned carefully and with much foresight some time ago. For as many as thirty years Italy has had her eyes fixed upon Tripoli; ever since she was forced to relinquish to France her economic and political claims in Tunis, where 100,000 Italians are being assimilated to 23,000 Frenchmen. When the treaty of Bardo was signed in 1881, establishing the French protectorate over Tunis, Gambetta is reported to have said: "In Africa there is room for every one. Why does Italy not take possession of Tripoli? France would offer no opposition."

Now, there are various reasons which can be alleged for Italy's desire to be in possession of Tripoli; all of which are valid from the Italian point of view, if that is the only measure for our judgment. These reasons are both political and economic. The political ones are not far to seek. The continued encroachments of Austria on the Eastern side of the Adriatic and the significant increase in the Austrian naval program have warned Italy that there is danger of this sea being controlled entirely by the Dual Monarchy; and Italy fears no one so much as she does one of her bedfellows in the Triple Alliance. The dynastic ties that bind Italy to Montenegro will not suffice to make of this miniature kingdom even a cat's paw in the grab for land. Italy fears, also, that the Mediterranean is quickly becoming an Anglo-French lake, in which her own influence will be greatly reduced. For when once France is firmly seated in Morocco, she will not only control the whole western part of the African coastland on the Mediterranean, but by her agreement with England all the "hinterland" of Tripoli down as far as Lake

ITALIAN SHARPSHOOTERS (BERSAGLIERI)

Tchad, thus holding Tripoli in complete economic dependence, which soon would lead to political subjection. According to the Italian view this makes an Italian protectorate over Tripoli an absolute necessity. Italy would also be able to turn the harbor of Tripoli or Masurata or Tobruk in Cyrenaica into a naval base that would rival that of France in Bizerta and would place the English naval station at Malta between two Italian fires.

It is generally held that Tripoli is almost worthless as a country for European colonization; or that at most only the coast-land is suitable. But this view is not substantiated by German and Italian travelers who have gone more thoroly into the question. At least two-fifths of its soil is capable of cultivation—an area larger than the whole of Germany. Corn, fruit, vegetables, dates, the vine, indigo, cotton and the esparto grass can be grown in the coast districts and with success; while the oases can furnish palms, almonds, figs, corn, tobacco, gum, etc. Nor must we forget that phosphate beds are known to exist in Tripoli, a matter of much importance for an agricultural country like Italy. Only recently a commission has been sent out by the government, working in connection with the Societa degli Agricoltori, to determine the exact place and the range of these deposits. Italy feels that Tripoli could absorb a part at least of the surplus population of the South and especially of Sicily, which is lost to the mother country by emigration to other parts of northern Africa and to South America.

In addition, some of the most direct routes lead to Tripoli and to the Mediterranean from the Sudan (Wadai and Darfur) and from innermost Africa. Again, it has been said that these routes have lost much of their importance in recent years because of the establishment of English rule to the northeast of the continent and French rule to the northwest, so that the products of Central Africa can reach the European and

American markets more readily by way of the Red Sea on the one hand and the Gulf of Guinea on the other. But this diversion of routes has been due to the lack of security existing under the old régime, when Tripoli was used as a sort of penitentiary for political offenders. The routes once properly guarded can easily become again the means by which the riches of the whole "hinterland" are brought to the markets of the world. Tripoli is the natural outlet for the North African caravan. The dictum of the great traveler, Gerhard Rolfs, that "Tripoli is the key of Africa; the whole Sudan belongs to him who holds it," remains true today as it was true in his own day.

Italy has not been slow to take the hint given her by France. Till now, she has also tried the French method, the so-called peaceful penetration. She has established a number of schools which are said to be model institutions in every way. She has founded branches of her "Banco di Roma," which have been of undoubted benefit to the inhabitants, for they enable the people to borrow money at 9 per cent. per annum in lieu of the 60 per cent. demanded by the native money-lenders. The "Navigazione Italiana" maintains a line of steamers that make regular calls at the various ports of the Vilayet. She has also sought commercial concessions on a large scale; has, in fact, demanded them of right. But all these efforts at "peaceful penetration" have only veiled very thinly the political aims of which they are the expression.

In the year 1900 Italy made a secret treaty with France, by which the latter power gave her a free hand in Tripoli in return for a similar concession to France in respect to Morocco; similar in many respects to the self-denying(?) treaty between France and England in 1904. But Tripoli was not a "no-man's land." It was and is an integral part of the Ottoman Empire; or, at least, a colony of that empire. There is no parallel to be drawn with Morocco. The au-

TURKISH INFANTRY

TRIPOLI: A PANORAMIC VIEW

thority of the Turkish Sultan was effective there—as effective as is Turkish authority in many parts of the empire. No wonder that Turkey proceeded—unfortunately, in her own insufficient manner—to strengthen her army there. No wonder that the enlightened and liberal Vali, Rejeb Pasha, founded a few years ago the "Banque Agricole de la Tripolitaine," to offset the political machinations of the "Banco di Roma." Because a country is not administered after our own fashion hardly gives us a moral right to seize it bag and baggage.

This determined and natural opposition on the part of Turkey was, of course, not to the liking of Italy. She soon came to the conclusion that peaceful means would not avail and that an armed invasion of the country would be necessary. That this invasion did not take place sooner than it now has, is due to the determined opposition of certain sections in Italy itself. We still remember the naval demonstration made in 1901 at Benghazi (the old Cyrene) in order to force an Italian post-office there upon the Turkish Government and to provide means for an Italian postal service with Sicily. The Marchese di San Giuliano was at that time Minister of Posts; the same statesman that is now to the fore as Minister of Foreign Affairs. The government of Signor Zanardelli had practically determined upon the expedition; Visconti Venosta was sounding France and Prinetti was dealing with England. In a fiery article in the *Nuova Antologia,* the late psychiatrist Cæsare Lombroso pricked the bubble of this new colonial venture.

The marauding character of this latest exploit upon the part of one of the "great" Powers of Europe is outdone only by the cynicism with which the attempt is made to salve the conscience of the civilized world. That conscience is told to rest assured that negotiations will be opened up with Turkey as soon as the occupation of Tripoli is assured; and the circular note sent by Italy to the Powers is said to close with the assertion that the action is taken in the interests of humanity and civilization! In the remarkable document published in the New York *Times* of October 1, the Marchese di San Giuliano continues the process of throwing dust in the eyes of the world. Even if all the allegations which he makes in that strongest of state papers were true, one may well ask: Are they a sufficient reason for demanding the cession of a huge piece of territory? For a protectorate is virtual possession. Not a word is uttered to the effect that Tripoli or the coastland is to be held as a gage until the complaints are redressed or that this act

is a menace to Turkey to be upon her good behavior. The extensive character of the preparations made shows us that we are face to face, not with a demonstration, but with a seizure.

Both Europe and America look on calmly while the act of spoliation is being consummated. One may well ask, Where is the Hague Tribunal? What has become of arbitration, about which we have heard so much during the last few years? Or are these ruled out of court when it is possible to bully a country that is practically defenseless? Is the doctrine to hold that because Turkey is a Mohammedan state it is outside the pale of civilized international comity? Then, we are back again in the Middle Ages and the Crusades have only taken on another form.

That Italy will succeed in what she has designed there seems little doubt. With her excellent marine she can, effectively and easily, prevent any reinforcements reaching the colony. It savors of mock heroics to read of the deeds of valor which the Italians are performing or are going to perform in Tripoli. The coast defenses are old and are probably worthless. It will take some time to subdue the country back of the coast, the oases and the desert lands beyond. But that is merely a question of time. There are probably not more than 25,000 Turks in the whole of the Vilayet; and it is quite problematic whether the Arabs will make common cause with their former masters, even if a Holy War is proclaimed. The important Senoussi brotherhood, settled since 1895 in the Oasis of Kufra, would hardly use its extraordinary influence over the Arab tribes of the desert in favor of the Turks. In fact, the Senoussi have made distinct overtures to the Italians; and there is no other power in those regions strong enough to weld together the discordant elements.

And Italy will succeed with the passive connivance of the other European Powers and the indolent inaction of the United States. Apart from whatever principle of right and wrong there may be involved, the danger is very present that such action as this may press the hydra-headed Eastern question to a settlement. Any loss of Turkish territory, no matter in what way such loss is glossed over, means a further weakening of the power and the influence of the Committee of Union and Progress at Salonica and Constantinople. Its repute has already suffered so much that its authority has perceptibly waned. Yet, notwithstanding the various mistakes that it has made, it remains the only body in Turkey that can save the state from crumbling to pieces. After the violent protestations of friendship and admiration with which European chancelleries greeted the new régime, one expected to see the hands of the new leaders upheld in the almost superhuman task they had undertaken. On the contrary, the old international intrigues continued; and the edifying spectacle was continued of the "great" Powers, in the guise of *commis voyageurs,* contending amongst themselves and browbeating Turkey into buying of their wares.

The hollow pretense of offering mediation only after Italy is safely ensconced in Tripoli will deceive no one; nor will the clap-trap shift that Turkey, in landing munitions of war in one of her own colonies and for its protection, has created a *casus belli,* blind the eye. The plain fact is that Turkey has no friend in her hour of need—not even Germany, no matter how full its mouth is in protestations of love for the Ottoman Empire and of its firm desire to preserve its territorial integrity. The appropriation of Tripoli by Italy will be only one more in the series of iniquities which has characterized the dealings of Christian Europe with Mohammedan Turkey.

New York City.

# Privilege Becomes Property Under the Fourteenth Amendment

## The Consolidated Gas Decision

BY JESSE F. ORTON, A.M., LL.B.

[In the issue of THE INDEPENDENT of April 16, 1908, President Hadley, of Yale University, contributed an article, entitled "The Constitutional Position of Property in America," in which he said that the celebrated Dartmouth College decision and the Fourteenth Amendment had placed the modern industrial corporation in an "almost impregnable constitutional position" in the United States. This article was followed in our issue of October 22, 1908, by "The Issue beyond the Parties," by Dr. Delos F. Wilcox, who commented on the great significance of President Hadley's article in its relation to the development of the movement toward a fundamental democracy. These articles were again followed by two contributions written by Jesse F. Orton in THE INDEPENDENT for August 19 and 26, 1909, that discussed the Dartmouth College case from a historical and a legal standpoint. We now print another article in this series, which is intended to show the attitude of the bar and the bench toward personal and property rights, thus presenting a somewhat complete picture of the present status of democracy in the United States. Owing to the heavy demand for extra copies of the back issues of THE INDEPENDENT containing the first four articles our supply has become exhausted, but copies of a pamphlet containing the series may be obtained by addressing the Secretary of the Committee to Inquire into the Status of Democracy, 73 Sixth street, Elmhurst, N. Y.—EDITOR.]

THE people are becoming interested in courts and judges as never before. Not only are they convinced that the "law-making function" of the courts (theoretically non-existent but in fact very real) needs looking after, but they are inquiring into ordinary decisions to see whether they are founded on justice and common sense. Many judges and lawyers do not like this. They have sought to keep the law a sealed book, a mystery hidden from the people, just as the priests in Wycliffe's time sought to keep the Bible from the people. The Bible was then buried in the Latin tongue, and Wycliffe's unpardonable sin was in putting it in the language of the people. Now, court decisions are hidden from the people in technical and tedious judicial opinions. The layman may know the result; but for him to understand the "how" or the "why" of it is considered impossible. For him to criticise is thought not only presumptuous on account of his ignorance, but almost sacrilegious, as indicating a lack of proper "respect for the courts." There is much need for a legal Wycliffe at the present time.

In weighing the records of their judicial servants, the people's attention is strongly attracted to decisions affecting the rights and privileges of public service corporations; for in these days a judge's decisions in such cases are probably the surest indication whether he is a just and faithful servant. Tested by this standard, the Supreme Court of the United States has made many good decisions; but the bad ones are all too numerous, and their effectiveness for evil is great in proportion to the power and authority of the court. Sometimes in the same decision good and bad elements are strangely combined. To a striking example of this class the reader's attention is here invited. It is the case of the Consolidated Gas Company vs. the City of New York.[1]

In 1906 the legislature passed the law regulating the price of gas in Greater New York, by which a rate of 80 cents per thousand feet was prescribed for Manhattan Island. The Consolidated Gas Company, having a complete monopoly of supplying both gas and electricity in the Borough of Manhattan and a practical monopoly thru the entire city, contested this law in the Federal courts, claiming that the 80-cent rate would not bring a fair return on the capital re-

[1] 157 Fed. Rep. 849; 212 U. S. 19.

quired in the business. The case turned chiefly upon the question, What was the actual value of the company's property?[2] The company insisted that account should be taken, not only of its material, tangible property, but also of certain intangible forms, like franchises or good will.

In the United States Circuit Court for the Southern District of New York, Judge Charles M. Hough held the 80-cent rate confiscatory and issued an injunction against the enforcement of the law. This was the result of his estimating the value of the company's property at nearly $60,000,000, in which was included $12,000,000 of franchise value. The United States Supreme Court reduced the total value to less than $56,000,000. This was low enough to make it doubtful whether the 80-cent rate was confiscatory; the Supreme Court, therefore, reversed the decision of Judge Hough and required the company to put the new rate to a practical test and see whether it would not yield a fair return. The franchise value on which the company was legally entitled to earn dividends was reduced by the Supreme Court to $7,781,000. This sum did not represent a dollar's investment by the company—merely franchise privileges received *gratis* from the State.

A few moments' thought will convince one of the absurdity of including the market value of a franchise, a mere right to use public streets, as a part of the property on which a company is entitled to earn dividends and of which it cannot be deprived by legislative regulation.[3] When a public service corporation charges rates that yield only a fair return on its property aside from franchises, there will be no income left over to be considered as income on its franchise, and the franchise will have no market value. But when rates yield more than a fair return on non-franchise property, the excess will be capitalized into franchise value. To say that the legislature must respect this value as "property," is to say that it cannot reduce rates at all. In other words, excessive rates make franchise value; reduction of rates to a reasonable figure wipes out franchise value; therefore, to forbid this wiping out forbids reduction of rates.

This truth, considered as a general proposition, was recognized by both courts. For example, Judge Hough, referring to the claim for a return on franchise value, said:

> "As an original proposition, I believe this claim unsound. Return can be expected only from investment, and he that invests must part with something in the act of investing. He that hath not sown shall not reap. . . ."

But, while acknowledging this common-sense rule that franchise values are not "property" as against the State's right to regulate rates, each court found a reason for not applying the rule in this instance or for applying it only in part. The position taken by Judge Hough in the Circuit Court is peculiar. Altho stating that the "crucial point" had not yet been decided by "the highest tribunal," he decided this case contrary to his own judgment, as exprest in the language above quoted. He concluded that he was "compelled to consider franchises not only as property but as productive and inherently valuable property, and to add their value, if ascertainable, to complainant's capital account."

By way of explanation, he tells us that often "the decision of the trial court is guided, in the absence of directly controlling authority, by the trend of decisions and methods of reasoning pursued in well considered cases dealing with kindred topics." After referring to certain decisions supposed to show a "trend" toward the doctrine contended for by the company, Judge Hough says

> "Instead of attempting to minimize and distinguish the decisions to which I have been referred and many others, it is my duty to follow the method of reasoning there clearly indicated, leaving it to the higher tribunals to make distinctions which, if drawn by the lower court, would in my opinion savor of presumption."

If Judge Hough and his colleagues could only know that the people, for whose service they are chosen, are waiting, yea, longing, for a judge who will be presumptuous in the cause of common sense, logic and justice! Would

[2] This is often a decisive question in this class of cases. If, for example, the legislature prescribed a rate under which a company still earns 6 per cent on a capital of $12,000,000, the action will be sweepingly upheld. But if it be made to appear that the company's property is worth $60,000,000, the return becomes only 1.2 per cent on the capital invested and the rate will be held confiscatory.

[3] If money has been paid into the public treasury for a franchise, the question may arise whether the owner should be allowed to capitalize the franchise at the sum paid. That question is not here considered.

that they could see that the public trust reposed in them forbids them to decide contrary to their own sense of right and reason in deference to anything short of unequivocal superior authority! Then, if reversed, a judge might have the compensation of being right. In this case, on the general proposition, Judge Hough has the double discomfort of being both wrong and reversed.

The Supreme Court did not recognize the "trend of decisions" toward allowance of dividends on franchise values in all cases; but in this case it allowed the company's franchise value, to the extent of $7,781,000, to be considered "property" entitled to earn dividends, on the theory that the legislature in 1884 authorized the capitalization of these franchises at that amount.[4]

By the law of 1884 the legislature authorized corporations engaged in manufacturing to consolidate, and prescribed the method of doing it. The directors of the consolidating companies were to make an agreement providing, among other things, for the amount of capital stock in the new company, which capital, the law directed, should not be "larger in amount than the fair aggregate value of the property, franchises and rights of the several companies thus to be consolidated." After this agreement had been approved by the stockholders of each company, the stock of the new company might be issued to the stockholders in the old companies, and the process of consolidation would be complete.

A few months after the enactment of this law,[5] six of the seven gas companies in New York City were merged into one corporation, the Consolidated Gas Company. The seventh company planned to join in the merger, but withdrew when its officers discovered that the company's charter made them subject to criminal prosecution if they should vote to combine with other gas companies. The "fair aggregate value" of the franchises of the six companies was fixt at $7,781,000 by agreement of their directors and stockholders, and stock of the new company was issued sufficient to cover this amount as well as the agreed value of the physical property. The entire amount of capital stock was increased by the consolidation from $17,000,000 to $39,078,000.[6]

The Supreme Court held the franchise value fixt by the companies, $7,781,000, to be constitutional "property," merely on account of the provision in the law of 1884, that the stock issued by the new company should not exceed "the fair aggregate value of the property, franchises and rights of the several companies" consolidated. There was nothing else in the law to serve as a basis for the decision. The court construed this *prohibition* as a *license* to the companies *to capitalize their franchises at an agreed amount and earn dividends forever on that sum* in spite of legislative regulation of rates. Whether this decision was that essence of wisdom, logic and justice which we have a right to expect from our highest court, the reader may judge.

1. *What does the law of 1884 itself say on the subject?* The court makes no mention of Section 5 of the law. That section, after providing that consolidation should operate as a transfer of all property and all "rights, privileges, franchises and interests of every kind" from the consolidating companies to the new company, continues:

> "And such new corporation shall hold and enjoy the same, and all rights of property, privileges, franchises and interests *in the same manner, and to the same extent*, as if the said several companies so consolidated had continued to retain the title and transact the business of such corporations. . . ."

It would not be creditable to the learned justices of the Supreme Court to assume that they did not read and consider the whole of the law (only three pages) on which they decided that the legislature made the Consolidated Gas Company a present of $7,781,000 of the people's money. Nor is it creditable to the justices to assume that they read, but did not heed, this plain language, which seems to have been carefully designed to fit a case like this.

The new company was to hold and enjoy the franchises "in the same manner,

[4] See Chapter 367 of the Laws of 1884.

[5] The passage of this law was secured by the gas companies themselves.

[6] No increase of stock could have been made under the consolidation law in force prior to the law of 1884. There had been enormous watering of stock thruout the history of the several companies. The stockholders of one company, who had never paid in but $750,000, received no less than $7,600,000 of stock in the consolidated company.

and to the same extent" as the old companies would have held and enjoyed them if there had been no consolidation. One of the conditions on which each of these franchises was granted and held was that the State might reduce rates to a reasonable amount based on the actual property of the company. This, therefore, was one of the conditions on which the Consolidated Gas Company was to hold and enjoy the franchises of the six consolidating companies; and the Consolidated Company had no standing in court to claim that the law of 1884 impaired the State's power to regulate charges for gas supplied by that company.

2. *If Section 5 be disregarded, is it true that the legislature gave up any of its power to regulate rates?* The Supreme Court held, not that the general power of regulation was given up, but that the State, by authorizing the issuing of stock for the value of the franchises, made that value "property," of which the holder could not be deprived "without due process of law"; therefore, legislative reduction of rates could not go to the extent of preventing fair dividends on this stock. The reader has probably perceived the fatal defect in this theory.

If we grant, for the sake of argument, that the legislative *prohibition* against issuing stock for more than the "fair value" of the "franchises" was, in effect, a *license* to issue stock up to the limit of such value, the vital question remains, On what basis was this value to be fixt? Were not the franchises to be valued just as they stood, as a horse is appraised just as he stands, with all defects and infirmities? The franchises were then subject to the infirmity that the legislature might so reduce rates as to wipe out part or all of the franchise value, just as a horse is subject to the natural infirmity that he may die within a month. Ordinary sense, the sense of horse-jockeys, would have told the companies in 1884 that they were not authorized to appraise or value anything except what they then had, namely, franchises subject to the legislative regulation then allowed by the Constitution. The market values of their franchises were subject to annihilation by regulation of rates. Undoubtedly, even with this infirmity, the franchises would then have commanded some price in the market, especially in view of the kind of legislatures with which the State had been blessed for many years. But nothing could be plainer than that the stockholders in the gas companies, who issued this stock to themselves, to represent their own valuation of their franchises, simply took their chances on future legislative reduction of rates. The persons who later purchased a portion of the stock took the same chances. Similar risks have been taken by the holders and purchasers of millions of shares of the stock of public service corporations, representing mere franchise values, before and since 1884. For the stockholders in the gas companies to think they could appraise their franchises, which were then subject to a definite and vital condition, and thereby rid them of that condition, had no more logic or sense in it than for a horse-trader to think that by paying a hundred dollars for a horse he can rid it of the infirmities of nature which may impair or annihilate its value at any time.

3. *The effect of the decision.* It appears from the opinion of the court that prior to 1884 the gas companies' rates had never been regulated by law and, as a result, excessive dividends had been paid, in some cases averaging more than 16 per cent. annually from the creation of the companies. In 1884 the six companies paid dividends of nearly 25 per cent. on actual investment. The price of gas was then $2.25 per thousand feet. The Supreme Court in effect says that the legislature of 1884 addressed the gas companies in some such manner as this:

"We are the trustees of the people, for whose service you were created and were given extraordinary privileges. We have the power, and it is our duty, to fix the price which the people must pay you at a reasonable sum, so that your compensation for this public service shall not be excessive. We have neglected this duty in the past, and your profits have been treble and quadruple what was reasonable. You may now combine into one corporation and capitalize your franchises, which you received *gratis* from the people, at such sum as would be considered 'fair' if it were quite certain that we would continue to neglect our duty and let you charge the same prices which now yield your excessive dividends. The stock which you may issue to represent this valuation of your franchises will be sacred 'property,' protected by the Constitu-

[illegible] against any impairment thru a reduction of coal prices by ourselves or our successors, world without end. Amen."

4. *The court's argument.* The court ignored the express language of Section 5, reserving all rights and powers of the State, ignored the fact that, in the very nature of things, the valuation of the franchises had to be made on the basis of then existing powers of regulation held by the State, and adopted the alternative theory that the legislature authorized the companies to appraise and capitalize their franchises at such sum as would be their "fair value" if the rates then existing were not to be reduced by law. Such a basis of valuation would have been bad enough under any circumstances; but, in 1884, rates were being kept up by methods that were scandalous in character.

The court reviews the report of a legislative committee appointed in 1885 "to investigate the facts surrounding the consolidation" of the gas companies. The committee concluded that under conditions existing in 1884, "the valuation of $7,781,000 for the franchises was not more than their fair aggregate value."[7] What were those "conditions"?

(1) The enormous dividends paid by the gas companies; (2) a law which "virtually prohibited the laying of any more gas pipes in the streets"; (3) an agreement between the gas companies "fixing the price of gas at a figure that paid these dividends"; (4) a contented public paying this price "without objection or protest"; and (5) the existence of no law that made these high rates or excessive dividends "illegal."

It was no secret that the law which "virtually prohibited" the laying of competing gas pipes had been put thru the legislature, concealed in a provision relating to *steam* pipes. It was well known that the agreement between the companies "fixing the price of gas," which had been in force since 1880, was accompanied by all the marks of a "pool" or "trust," division of territory, suppression of competition, the pooling of earnings, etc. "Condition" 3 and "condition" 5 could not exist at the same time. The price-fixing agreement and the "pool" which made it effective were plainly "illegal" at common law, as the Supreme Court knew by its own decisions as well as those of other courts[8]; and the taint extended to the resulting rates and dividends.

Yet the court complacently comments thus on the committee's report:

"Assuming, as the committee did, that the company would be permitted to charge the same prices in the future which in the past had resulted in these 'enormous' or 'excessive' dividends, it need not be matter of surprise that a franchise by means of which such dividends had been possible was not regarded as over-valued at the sum stated in 1884."

Merely because the legislature *forbade* the companies to issue stock for more than "the fair aggregate value of the property, franchises and rights" of the several companies, was the court to hold that the legislature *authorized* the companies to capitalize their own unlawful conduct, to determine a "fair value" of the right to continue extortionate charges and make them effective by a scandalous and illegal combination, and then to earn and pay dividends on this "value" forever, at the expense of the gas consumers of New York, in spite of future regulation of the price by law? To say that the legislature meant to do this, was to impute a foolish and presumably corrupt purpose to the law-making body. It is a well established legal principle that this is never to be done unless such an intent is expressly shown in the language employed by the legislature. No such intent, or shadow thereof, can be found in the law of 1884.

The Supreme Court did not attempt to meet this situation by referring to any words contained in the law; it merely said:

"We think that under the above facts the courts ought to accept the valuation of the franchises fixt and agreed upon under the act of 1884 as conclusive at that time. The valuation was provided for in the act, which was followed by the companies, and the agreement regarding it has always been recognized as valid, and the stock has been largely dealt in for more than twenty years past on the basis of the validity of the valuation and of the stock issued by the company."

If the agreed valuation of franchises be "conclusive," why should not the valuation of the physical property also

[7] This was merely a Senate committee and had no authority to bind the State by its conclusions. Moreover, it recommended a reduction of rates, and the legislature reduced them from $1.75 to $1.25 per thousand feet. The Consolidated Company had made a voluntary reduction from $2.25 to $1.75.

[8] See Gibbs vs. Baltimore Gas Company, 130 U. S. 396, and cases cited; also Charleston Gas Company vs. Kanawha Gas Company, 58 W. Va. 22, and People vs. Milk Exchange, 145 N. Y. 267.

be conclusive? But no one, apparently, has thought of suggesting so absurd a result. The appraisal of physical property was subject to this, among other possibilities, that a new invention might soon reduce or wipe out its value. In like manner, the appraisal of franchises was subject to the possibility that the State would lower the rates charged for gas and thus reduce or wipe out franchise values. The appraisal agreement between the stockholders of the gas companies, valuing these franchises, may have been "valid," as the court says, but why should it bind any one except the persons who made it? The $7,781,000 may have been represented by "valid" stock, but it does not follow that an income of six per cent. was guaranteed. There is much "valid" stock which yields no income whatever. The argument of the court is simply "beside the mark."

All this seems evident on the face of it. But if we invoke the well established rule that when a person or corporation claims privileges inimical to the public welfare, all doubtful questions must be resolved in favor of the people, there can be no uncertainty as to the result.

5. *Was it necessary to construe the word "franchises" so as to include the gas companies' right to realize on their faith that future legislatures would be like those gone by?* Undoubtedly, their "faith" was not of the sort which is "dead" because it is "without works"[9]; but did the court have to give their faith such life as to make it net them $7,781,000? The word "franchises" might well have been construed as including only rights legally enforcible against the State. If, for example, a company was authorized by law to charge 90 cents per thousand feet for gas, such a right might have been held to be included under the term "franchises," while mere hope or expectation of legislative indulgence in regard to rates was held to be excluded. Courts have often made less obvious distinctions and in worse causes. Under this construction, the law of 1884 *forbade* the issuing of any stock for these gas franchises.

The opinion of the Supreme Court, nominally against the company, but really in its favor on the most important issue in the case, was given by Justice Peckham, and received the concurrence of all the other members of the court—Chief Justice Fuller and Justices Harlan, Brewer, White, McKenna, Holmes, Day and Moody. Thus was the legislative sword, drawn against monopoly, turned back into the vitals of the people, in whose protection it had been raised. A prohibition designed to check over-capitalization had been transformed, in the judicial crucible, into a license for extortion. Thus, as often happens, the people got *the decision*, but the corporations got *the law*—for future use.

The irony of the situation is shown by the fact that between the decision of the Circuit Court and the decision of the Supreme Court, the New York courts refused permission to the Attorney General to bring a suit against the Consolidated Gas Company as a monopoly in restraint of trade; and the refusal was based on the theory that the company could not restrain trade. This was impossible, it was said, because the legislature *had full power* to fix the rates to be charged for gas.

Respect for the courts and confidence in them are necessary to successful popular government. But it is no less necessary that such respect and confidence should be withheld unless they are earned by just and reasonable official action. In order to secure an intelligent and fair attitude on the part of the people, they must know and understand the facts. Let them turn upon the judgments of the courts the searchlight of analysis, common sense and good conscience. If what they discover brings a falling off in the traditional respect and confidence, that fact should, and probably will, contribute toward the adoption of means for the removal of the causes. It is more dangerous to proceed in ignorance than it is to know the worst.

New York City.

# Spectacular Woman Suffrage in America

BY BERTHA DAMARIS KNOBE

THAT woman suffrage in this country has attained the spectacular stage is most significant; and, this summer, an unprecedent series of picturesque propaganda—street parades, curbstone speeches, town-to-town automobile tours, suffrage "specials" by train and trolley—have been everywhere employed, with amazing success, to carry the message more particularly to the "man in the street."

Undoubtedly the woman suffrage parade in New York early in the season was the immediate inspiration of these unconventional maneuvres. That splendid pageant of 3,000 picked representatives of the professions and philanthropy made a profound impression, not only upon the masculine spectators who packed fashionable Fifth avenue for two miles, but upon the women marchers themselves. The women were likewise stirred, on the one hand, by the recent victory of Washington as fifth full-suffrage State by the overwhelming vote of 50,000, and, on the other, by the whirlwind campaign in California following the flattering vote of its legislature to put the question to the people. The tread of their intrepid feet on that historic day—it ranks as the first big suffrage parade in America—was heard by half-afraid sisters in every hamlet, spurred by this courageous exploitation of principle to undertake a popular campaign in their respective sections.

These suffrage insurgents occupy the strategic point between the old-time academic American suffragist and the modern militant English suffraget. For sixty-three long, ladylike years the American contingent were mostly content with papers politely read at parlor meetings, in winter, to women already converted to the cause, and, in summer carefully put away in moth-balls; while the American man, politically endowed but indifferent, imbibed his notion of the movement chiefly from the caustic cartoon. Tho thirty-one States today possess some form of enfranchisement; the suffragists, prior to Washington, had not scored a full-suffrage State in fifteen years, and, moreover, they saw foreign countries forging to the front—thirteen have full-suffrage or every suffrage except parliamentary—with a sense of discouragement. When Chicago suffragists finally importuned Senator La Follette for campaign suggestions, this astute politician promptly said: "Stop making speeches before churches and women's clubs, but prove your power out in the public before men—men who make the laws."

Six years before, American women alike with the whole civilized world, were startled by the militant outbreak in England. The indignant supporters of little Annie Kenney, the underpaid factory girl thrown into prison when she dared to openly importune Sir Edward Grey, M. P., during a meeting—an English custom, may it be remembered, for which men are never arrested—undertook to shock obdurate John Bull into doing something for suffrage. Their tactics included only the occasional transgression of some minor law, and, on the other hand, the persistent "pestering" of opposing politicians—every move being made is as sensational as possible. The success of the "shock" was two-fold: When that mighty army of 40,000 suffragets swept down the streets of London, in June, to the martial music of seventy bands and bearing aloft one thousand brilliant banners, the crowd did not sneer or jeer, as formerly, but exprest their sympathy in applause; while the universal acknowledgment of pulpit and press stamped it as the greatest political demonstration in England. When the suffrage bill came up before Parliament it passed the second reading by the surprising vote of 255 to 88, and "Run-Away Asquith," the Prime Minister who earned this soubriquet by bolting out the back door every time a delegation of suffragets called upon him, has meekly prom-

ised to set aside one week of next session of Parliament to the all-important third reading—confidently expected to be the hour of triumph.

Convinced that "publicity pays," American suffragists copied the spectacular tactics of their English sisters—this step stamps them hereafter as "suffragets"—with "pestering" in isolated spots. Apparently there is no disposition to trespass on the statutes—as yet. Perhaps conditions in America will never compel the penalty of jail sentences with their hunger-strikes, which prove seven hundred English suffragets the stuff of which martyrs are made; but, from widespread reports of picturesque campaigns, it is plainly evident that our women—even the women of the South—are animated by a new spirit of self-sacrifice. Even the strong-hearted shrank at first from the necessary notoriety, and the so-called "soap-box crusade" began rather ingloriously in secluded parts of the public park. The party of Chicago suffragets touring Illinois by automobile drove desperately thru the side streets of Rockford, making their maiden speeches before two children and a dog before the Rev. Kate Hughes mustered the nerve to face the throng on the main thorofare. When Mrs. Harriot Stanton Blatch of New York, the "Mrs. Pankhurst of America," made the daring proposal of a parade, it filled the souls of her followers alike with thrills of delight and despair; but so inspiriting was the sight of the "women

FUTURE VOTERS PARADED IN NEW YORK

Two East Side mothers trundled their babies in the Woman's Suffrage parade

SOME OF THE "SUFFRAGENTS"

"Husbands" of Woman's Suffrage served during the hot campaign in California, and in this automobile Hon. J. H. Brady, the Pasadena millionaire (in the dark suit) and Robert J. Burdette, the humorist, occupy the rear seat, while in front sit the two legislators who fathered the Woman's Suffrage Bill

who did" that scores of the faint-hearted, vainly importuned to participate, speedily flocked to headquarters of the Women's Political Union, eager to pledge their names for "next time." Among those previously prejudiced against such publicity was Mrs. Frederick Nathan, president of the New York Consumers' League, who looked so imposing on parade that one admiring man called to her: "If you ever run for President of the United States, I'll vote for you"—a little story she told on herself to prove that courage has its compensations.

Immediately after this triumphal march, Baltimore suffragets trampled on Southern pride and prejudice by proclaiming a parade. Brilliant with four bands, composed of women only, bebannered automobiles, decorated floats and suffragets afoot, it promises to be further original with a sprinkling of English insurrectionists imported for the occasion. That it may develop into a national demonstration its promoters cleverly seek to attract home-going delegates from the National Woman Suffrage Association, which meets at Louisville in October, by setting a subsequent date. Previously they practised on the street by entering three floats in the Fourth of July parade, with a white-gowned girl at the head of each white horse. The first was a striking representation of Mistress Margaret Brent of Maryland, who, in the seventeenth century, attempted to cast her vote. Simultaneously Chicago women—among innumerable aspirants—announced their intention of falling in with the procession, so to speak, next spring, at which time the New York precursors will make their second appearance with an army that will undoubtedly number 10,000 strong. Thus is fulfilled, in part, the prophecy of Walt Whitman:

"Where women walk in public processions in
the street the same as men;
Where they enter the public assembly and take
their places the same as men;
Where the city of best bodied mothers stands,
There the great city stands."

Another popular scheme, to attract the masculine law-maker in the highways and byways, is the automobile tour. Conspicuous were Chicago suffragets with a woman chauffeur, whose itinerary included eighty towns in Southern Illinois. Their business-like methods were shown by the advance agent, who plastered the country-side with big three-sheet posters: "Watch Out for The Suffraget, the Automobile with a Purpose." They also sent persuasive epistles ahead to the Mayor, asking him to introduce the speakers at the first street meeting, and to editors and presidents of women's clubs that a full-fledged suffrage society might be left as souvenir. The personal inconvenience may be appreciated by the fact that, on several occasions, the women were compelled to sleep at night in a neighboring orchard, owing to the intense heat. As the farmers flocked around their gayly-decorated automobile, the suffragets indulged in political "pestering" on the side. At Warren, Mrs. Catherine Waugh McCulloch, an attorney-at-law and vice-president of the National Woman Suffrage Association, unfolded the political history of Mr. Gray, their State representative. "He knifes the woman suffrage bill every time it comes up for a hearing," she declared indignantly. Thereupon several of his political supporters went to his near-by home, and, pushing him to the front, pointedly asked him to declare himself; and the blushing Mr. Gray shook hands with the suffragets, promising his future favor. New York suffragets, under Miss Harriet May Mills, conducted a thousand-mile trip thru the State, besieging the thousands of workingmen as they poured out of factories, and, moreover, always preceding the night meeting with a parade. In

the town where the band-stand served for a platform, the women had to climb up on a ladder. In Connecticut four automobiles traveled in out-of-the-way places, the party employing a band to play on the village green every evening. Between sessions they industriously pasted suffrage posters on barns and fences, shops and post-offices, and made a call on every farmer's wife in the community, not forgetting to leave suffrage literature with their cards.

As a cosmopolitan campaign center, New York naturally sets the spectacular pace. The Woman Suffrage party, admirably officered by Mrs. Jean Penfield while Mrs. Carrie Chapman Catt is making a woman-suffrage tour of the world, presented a patriotic sight on the Fourth of July. Sitting a-top of old-time stage coaches, driven by men in Continental blue and cocked hats, they showed themselves possessed of "The Spirit of 1776," as one poster proclaimed, by decorating with wreaths the monuments of departed national heroes who declared for woman suffrage—Lincoln, Lafayette, Washington and Nathan Hale, not forgetting the great Garibaldi, their Italian friend. Compared to the noble sentiments of these patriots, Mrs. Penfield, in the course of her address, excoriated the vulgar statement of the late Senator Grady, made in the recent woman suffrage debate in the New York Legislature: "Women watchers go to the polls as to a dog show—to admire the different animals." The Women's Political Union started their summer campaign at Syracuse under Mrs. Blatch, who, compelled to sit in the smoker en route, improved the opportunity to make a little suffrage speech to the men passengers. Having opened a "suffrage shop" in the downtown district as headquarters during their sojourn, they proceeded in a Chinese lantern procession, at night, to the residence of Senator J. Henry Walters, sitter on the political fence whenever suffrage is presented. Following this public importunity of suffragets, he indulged in the same old diplomatic reply: "I hope that my constituents will trust me in believing that I shall act, as I always endeavor to do, in the manner which I consider to be best and for the greatest good to the greatest number"—which polite evasion marks the gentleman for future attack. Under Mrs. O. H. P. Belmont's patronage the Political Equality Association began the season with a brilliant political ball at Terrace Garden, notable as the first in the world; and, typical of subsequent pyrotechnics, was the sailing of 300 votes-for-women balloons from one of their headquarters, incidentally annoying Carl Damchinsky, their "anti" neighbor, who felt compelled to erect a spiked fence.

Perhaps because Massachusetts is the "anti" stronghold, its suffragets have been particularly ingenious in their publicity. Previously, Miss Margaret Foley, campaign manager for the New England Suffrage Association, went up 800 feet in a balloon at Lawrence, showering yellow suffrage pamphlets on the watching crowd below. Thereupon the Brockton women put a dashing team in the circus parade, distributing colored flyers and campaign buttons all along the route. At Taunton the megaphone was used on the street corner and at factory gates to announce the evening meeting on the common, when a band concert, with torches and colored fire, preceded the talks. During the recent Cotton Carnival at Fall River an automobile, placarded "Working Women Need the Vote," created such a sensation that the Mayor, thru the Chief of Police, invited the suffragets to stay out of the parade next day; thereupon they twice maneuvered the same automobile, embellished with more banners, so that it squarely met the first carriage containing President Taft and the Mayor, and afterward took a conspicuous place in the cleared pathway down which the official party passed in leaving the grand stand.

In promoting the big spectacle, shrewd suffragets always improve every small opportunity to appeal to the masses. When Miss Jane Addams headed the "Woman Suffrage Special" from Chicago to Springfield, fifteen-minute stops were made at every station for speeches from the tail-end of the train. At Bradley one factory closed so its five thousand working men could go to the station; also the public schools at Clinton. During "suffrage week" at Albany, engineered by Mrs. Clarence Mackay to advertise the legislative hearing, great

SPELLBINDING IN ILLINOIS

Mrs. George W. Trout, president of the Chicago Political Equality League, spoke from the rear of the "Woman's Suffrage Special" on its way from Chicago to the State capital.

three-sheet posters, even in surrounding towns, announced the coming of a train-load of New York suffragets; street cars were fairly plastered with suffrage sentiments; an electric sign across the principal street emblazoned its message, and even the moving-picture shows presented the suffraget in action. In Baltimore the prospective parade was supplemented by suffrage-inscribed fans, distributed to the perspiring multitude at the cost of only $16 a thousand, and paper bags printed for sympathetic grocers for $1 10 a thousand. At countless county fairs a be-bannered suffrage booth blazed forth; likewise brilliant tents at public pleasure grounds, as Van Cortlandt Park, Clason Point, and Coney Island in New York. Under the auspices of the Woman Suffrage party the metropolis claims the first suffrage club house opened this summer, where every piece of linen is embroidered with the eternal "Votes for Women," and its permanent or transient guests from over the country are served with similarly marked china by maids attired in suffrage colors. Clubs in the cities support from one to fifteen imposing headquarters, where typewriters click incessantly with official business; and, moreover, the individual suffraget, adorned with suffrage button, writes her letters on yellow stationery and sticks a suffrage stamp, imprinted with the five full suffrage States, on every epistle or package.

As counterpart to this spectacular publicity the "pestering" of opposing politicians, incidentally mentioned, promises to be increasingly employed in an organized way; and, only the other day, Miss Margaret Foley and six of her followers were arrested at Roxbury, Mass., for repeatedly questioning ex-Senator James F. McInerney during an open-air meeting. It is significant that both publicity and "pestering" were recommended by two men distinguished for a lifetime of devotion to the cause. When John Stuart Mill, whose "Subjection of Women" aroused the thinking world to the unjust position of the fair sex, made an impassioned appeal for woman suffrage from the English Parliament in 1867, he said: "I admit that one practical argument is wanting; women do not hold great meetings in Hyde Park or demonstrations at Islington"—and his hearers laughed uproariously at the idea. The late Henry B. Blackwell, of Boston, shortly before his death, reiterated in a signed editorial in *The Woman's Journal,* which, with his famous wife, Lucy Stone, he founded forty years ago: "Whenever our women discover that the primary object of woman suffrage clubs should be to question candidates for the Legislature and then to help elect the men pledged to the cause, they will succeed." The enemies, on the other hand, have been mercilessly assailed by New York suffragets in two instances. Under Mrs. Blatch a two weeks' fusilade of speeches—eighty the day before election—concluded the campaign in the district of Artemas Ward, candidate for re-election to the Legislature; and his majority dwindled from two thousand to two hundred. Mrs. Belmont conducted a personal attack in Senator George B. Agnew's bailiwick, and the gentleman suffered a total eclipse at the polls.

That these stratagems have moved the sought-after "man in the street," who, in turn, elects the lawmakers, is evident. Everywhere this interested person—this easily-interested person, so say the curbstone orators—has signed his name to petitions, put the suffrage button in the lapel of his coat, and promised his support. Particularly encouraging are the men's clubs in fourteen cities, organized to promote the cause; while eighty prominent New Yorkers, who composed the "husbands' section" of the parade, prove that conviction is matched by chivalry. The unenlightened onlooker, however, may be likened to the party of East Side newsboys, obviously imbibing their idea of suffragets from scare-heads of the sensational papers they peddle, who, stationed on the sidewalk, were prepared with apple cores and paper wads to assault the paraders. When that magnificent body of women, proudly marching to the music of five bands and bearing one hundred banners, appeared on the scene, the ringleader turned to his companions and said, half-disappointedly, "Aw, them ain't the kind!"—and the missiles were promptly relegated to breeches pockets. This was precisely the attitude of mind of the man who had never seen a suffraget except on the funny page; he went to the parade to ridicule, but, awed and interested, ridicule was turned to respect.

Picturesque campaigns, in the meantime, are pending in five States. Stimulated by lately-enfranchised Washington, whose suffragets employ every clever scheme from stereopticon shows on the streets to placards on racehorses, their sisters in California, Oregon, Nevada, Kansas and Wisconsin—these legislatures likewise voted to put the question to the people—have strenuously taken to the curbstone speech. If the listening "man on the street," in California, expresses his approval to the polls the 10th of October it will mean the political freedom of 400,000 women, and, moreover, the greatest woman-suffrage victory in America.

New York City.

# "The Imp"

BY LOUISE DUNHAM GOLDSBERRY

MY neighbor's Imp. I have none, of either sex. If I had, they would be born well-bred, with poise, and no pre-Adamite tendencies to universe-defiance of *lungual* exercise. I coined the word for the occasion; for it came, quite unexpected, when racking my brain for a vocalization of the extraordinary voice-power of that Imp. And I think *lungual* a word of force; it means what it says. So does the Imp.

Mine would have been proper. Absolutely. Would have wept as decorous born-well-bred babes should weep. They would not have inherited from me, in that regard. For when I weep, all the pent-up, dammed-in pre-Eve elemental emotionalism of abstract womanry, comes out. The storm rends me, spends me. Leaves me prone on the floor; face down; a rag of soul at the Divine Feet.

But they say I did that in babyhood. Face down on the floor. I suppose it was the elemental too big inside the tiny woman-thing, seeking mother earth's comforting: ergo; no forest padded lap of ferns to flee to, instinct took to the floor. And still takes to it, now.

But let us hope my man would bequeath poise and mental equities. Would have, I should say. For there has never a baby come to blossom for us. Never a one. Though I have cried at Calvary's Cross and vowed vows to the Child of Mary.

He found me, one dusk-time. Some woman went by and a baby laughed his kisses against her lips. A woman of the people. And she spoke a swift strange speech of foreignry back to the child, that I could not understand. But I understood the baby-laugh and the baby-kiss. They are the only language God has made of one tongue over all the earth.

And in the dusk my heart broke again; for *my* baby's laughters and *my* baby's wet lips—the babe I had never had. And he found me, storm-rent and storm-spent. I'd forgotten to lock my door.

So, *don't* you understand how the Imp annoyed me?

And how, from the first time I looked into his blessed eyes, I coveted? Those eyes; fresh from the angel journey in the little ark of life? Can't you see, how I coveted? And how I hated the little mother with loving hatred, because the interpretation of the look of those eyes just sent to her new-finished from God's hand, was for her alone?

I did not kiss him.

She said: "My lady, only you may kiss him right on his lips."

But I kissed her, instead.

"*I can't,*" I whispered; "dear little mother, I can't."

She just drew my face down to the new velvet of his cheek, and said never a word. I was his slave ever after. But I have never kissed a little baby. And I could not find a word precious enough to call his preciousness—so I called him the Imp.

His lung-power was phenomenal.

When inclement weather confined the sounds in-window, the neighborhood did not rebel. But as he reached the toddle-age, and made predatory incursions thru defective hedges and neglected fences and left-open gates; and took squatter's rights in some adored tulip-bed, gold-pollened from the pillage of a summer's en-flowering; or when he was found prone and angelic-sweet in a blowing lily-of-the valley bed, or sucking the honeysuckle's honeys, the neighborhood filched my name for him. For he lifted up his voice, when ejected. Lifted it up far and wide and cried to the winds of the

heavens and the fowls of the air—and the neighborhood went down to look to its gate latchets and said: "Just *hear* that Imp!"

And the name I gave him because of the sheer preciousness of him the neighborhood called him to express otherwise un-expressible feelings.

He lugged my cat by its tail. My black Angora. And bite-and-bite-about fed her bread-and-honey.

His own cats were always kittens. Kittens do not scratch. His puppy was known abroad and under city guardianship. A policeman once found a gamin and the puppy arm-in-arm. Said he: "What yuh doing with Th' Imp's Pup?"

Said the gamin: "Honest?"

Said he: "Sure."

Said the gamin: "Found ut; les take ut home."

As they came up the square a voice rose up to meet them.

"*For gracious!*" said he; "he's just about discovered the pup's lost."

So it was, and he embraced them all, pup, policeman, gamin. And the neighborhood went down to look to its gate latchets.

He said to me one day: "'Fere is *all* you babies?"

I said nothing.

He said: "Doesn't you not want some boys *an'* babies *an'* dirls?"

I said nothing.

He said: "My muvver is drefful, offul *dlad* she've dot me."

Wheedlesomely, alluringly, as tho to win me to want them, those "boys *an'* babies *an'* dirls."

Whereas the neighborhood kept hedges in repair unknown hitherto, I made a hole in my hedge, cut it out with scissors, kept it trimmed and green-soft, that no twig catch in the silken skeins of the little head coming thru, nor trip the little feet.

He came back from the hole in the hedge.

Leaned hard against me, lovering, sighed. "I *fink* you's drefful pwitty," he said; "mos' as pwitty's my muvver," he said; "course she's the mostest," he said.

Came a day when the doctor's buggy stood at the Imp gate, and no one in all the neighborhood thought of its hedges or went out to look to its gate latchets.

And the silence in the Imp's house dumbed the sounds in the street, and the wagons went 'round the other way, and carts turned aside, and on the Imp's front door a scrap of pasteboard read: "*Please do not ring the bell.*"

And the neighborhood soft-stepped across the threshold, in and out, with eyes that gave pity the lips might not utter. And came a day when my lilies of the valley hung, a tear-dewed wreath, from the doorknob, and within in the odorous dusk, white and still as never before, slept the Imp.

And I crept in in the dusk, and kissed the little chill feet. "Oh, little feet! little feet! Blessèd the flower beds in His fields that are trod by you," I sobbed to them. And the neighborhood crept in, and we made of all the floor of the dusk-dim room where he slept a carpet of flowers for the feet of them who carried him out to trample under.

And we hid in flowers, in roses and pansies and tulips and honeysuckle, the wee bed that should cradle him never again, and the wee chair that never again would go a sea-sailing with him and his kitten and his puppy; and never a blossom beloved by the Imp remained in all the gardens of the neighborhood. And we made beautiful the little last bed where we must lay him down. And we carried him out, and we laid him lovingly down to his baby rest, to sleep with the kings and the lovers and the mothers of all the earth until the day break and the shadows lift and flee away.

And I, in the dark of the night watches, kept soul vigil with the mother who "would not be comforted."

She *had* had him. He *had* lain in her bosom. All the sweets of his lips and his eyes and the white bloom of him had been hers.

And forever and forever would be hers.

Forever and forever.

WASHINGTON, D. C.

# American Professors of Dramatic Literature

BY MONTROSE J. MOSES

[Mr. Moses is the author of "The Literature of the South," "Henrik Ibsen," "Maurice Maeterlinck," and other books, of which the latest, "The American Dramatist," has only just been issued by the publishers.—EDITOR.]

TOWARD the close of the New Theater's second season, Prof. Brander Matthews conceived a very excellent plan of impressing the development of the drama upon the minds of the people. He gave short talks upon significant periods in the theater's history, emphasizing how far the plays reflected the life of the age in which the dramatist lived; he likewise called attention to the manner in which the physical proportions of the stage determined, in many respects, the scope of the plot.

But Professor Matthews, with the assistance of Director Ames, did more than this; he actually had presented before the people scenes from plays of the distinctive periods, and these scenes were all mounted in accordance with the conventions of the times. During this course of lectures, the New Theater was crowded from pit to dome by those young students of the drama anxious to see a pageant wagon upon which the mystery plays were performed in medieval days, curious concerning an interlude platform or an Elizabethan "apron," and so on thru the various eccentric details of the stage. The plan was informing, and marks Professor Matthews's contribution to the university's endeavor to teach the drama. The scholar's idea of the theater is likely to be as thoro and as dry as Dr. Felix Schelling's "Elizabethan Drama," which examines closely the forms and shades without aiming to catch the spirit. The research worker must do a certain amount of essential hounding of fact. But, inasmuch as the theater is born of the people, it is wrong to deprive it, in the written record, of its distinguishing humanity.

PROFESSOR ROBERT HERRICK
Professor in the University of Chicago, and American novelist

That is what our universities are now beginning to realize, and while they still insist on spending most of their energies in investigating the period of Shakespeare, and while in their consideration of modern drama they hardly advance beyond plays of the Restoration, they are revitalizing the work which scholars have made as dry as dust.

At Columbia University, Professor Matthews has begun a dramatic museum; this is an outward proof of his insistence that always the drama has been written to be presented on a stage, by actors, and before an audience. In his book on "The Drama" this belief has full exposition, and the museum idea is graphically suggested, if it is not specifically mentioned. A room has been set

GEORGE PIERCE BAKER

The first Professor of Dramatic Literature in Harvard University; author of "The Development of Shakespeare as a Dramatist," etc.

aside in the university for models of the different theaters thruout the ages. Instead of reading volumes of specifications, the student may be brought before the theater of Dionysus, the Roman theater at Orange, the Passion Play stage, the Tennis-Court Theater, and, with the text in hand, see wherein the practical dramatist—Æschylus as practical as Thomas, Shakespeare and Molière as practical as Fitch—had to consider the physical limitations of the "boards."

Recently Professor Matthews acquired, while in England, a reconstructed interior of the Fortune Theater, in which Shakespeare is supposed to have acted. Already English scholars are looking jealously at Columbia's luck in securing this model, made by Mr. A. Forestier from specifications left by Edward Alleyn. To my mind, this represents scholarship vivified, for analysis should always be followed by synthesis. Shakespeare is for all time, but he wore an Elizabethan ruff, and his audiences had Elizabethan tastes.

This objective dealing with the theater is a new phase of collegiate work. A literary discussion of the drama is different from actual dramaturgic consideration. While there have always been courses in the Greek drama, and on Shakespeare and his related craftsmen, it is only since 1892 that a more strictly theatrical consideration has begun to develop. Professor Matthews believes that drama may be taught, since it can be learned, but tho the technique is in a way evolved in accordance with the laws of mechanics, what goes inside, what covers the mere framework of the drama, is dependable upon the individual dramatist.

Aptitude for the drama, according to Professor Matthews, is best determined by familiarity with the historical aspects of its development, subjected to critical method. If one consider for a moment it will be seen why the university is careful in its courses on drama. The college should not be offered opportunities in the study of the contemporary stage, for the reason that to the student, in the formative period, only permanent examples of dramatic art should be presented for study.

The general belief is that the university should leave its impress upon a body of dramaturgy. But I believe that this is true only in so far as a body of doctrine, emanating from a university, might educate a people, arousing their appreciation for better things. Of course, if the university can send forth dramatists filled with serious determination—men and women trained to the best technique, prompted by the best traditions, then so much the better for the stage. But where the university has yet to exert itself is in the matter of awakening the student body to vital ideas, without which even the best technique is a mere husk.

Because of this widespread interest in the theater, our universities thruout the country have had to add courses to their curriculum. Matthews, of Columbia; Baker, of Harvard; Phelps, of Yale; Burton, of Minnesota; F. W. Chandler, of the University of Cincinnati; Tucker, of the Brooklyn Polytechnic, and Gay-

ley, of the University of California, are actively engaged in working out the best methods of teaching the drama. To these may be added the latest recruit, Prof. Robert Herrick, of the University of Chicago. Thru their zealousness, the college "show" is becoming something worth while, and when we can have such an organization as the Yale Dramatic Association, which has not only presented plays of vital significance in the history of the drama, such as Sheridan's "The Critic" and Ibsen's "The Pretenders," but has also issued acting versions of these plays, we then readily understand the almost revolutionary character of the methods of teaching drama in our universities and colleges.

Professor Baker, of Harvard, is somewhat didactic and theoretical, but his results are perhaps the most encouraging in the university at present. Harvard teaches the academic phases of drama, and the student finds ample opportunity to delve in research to his heart's content. But from the student came the natural request, after a course in the study of technique, that, instead of devoting time to minute analysis, he be allowed to practise what the course had preached, in actual examples of playwriting.

The consequence is that as an outcome of this practical work, in a course known as English 47 on "The Technique of the Drama," the applicants for admission to the course have to submit an original play. For the MacDowell Fellowship, established to encourage the collegiate playwright, this condition is increased. English 47 requires, during its progress, that the student write an adaptation, a one-act play, and a play of three acts. Harvard's Dramatic Club presents, each autumn and each spring, plays selected by members of its student body. Even undergraduates in smaller colleges are showing their rival interest in the acted play, other than musical comedy. Saint Francis Xavier, Tufts, the University of Syracuse, and the College of the City of New York are all interested along this line.

Every university has its distinctive interest in the study of drama. One still continues to hope that in the East there will be erected a Greek Amphitheater similar to that erected by Mrs. Phoebe Hearst at Berkeley, California. There is no doubt that what Professor Matthews is demonstrating by his museum will be followed by others. And now, Professor Robert Herrick has added another feature that has been esthetically done heretofore in the study of Shakespeare and the Restoration dramatists only—he has established a course in play analysis of dramas since Ibsen; thus coupling contemporary drama with technical treatment.

The universities are likewise beginning to show interest in the preservation of dramatic records, and, while there will never be an ideal dramatic library until there is a definite library for the drama, at least the scholar is beginning to see that there must be sources assured him. I have always stood for some definite building dedicated to the literature of drama, and sufficiently endowed to allow its librarian to buy up all collections that, under the auctioneer's hammer, become scattered among curio hunters.

WILLIAM LYON PHELPS

Professor of English Literature in Yale University, author of several volumes of criticism and a contributor to THE INDEPENDENT.

Professors of dramatic literature should give this matter consideration. Where are the extensive libraries of John Brougham, W. E. Burton, or Augustin Daly? Our dramatic books are scattered, and the public libraries have not yet given the drama that specialized position accorded it by the university.

Now, all this activity would be as theoretical as the former manner of treating the drama, had it not led to practical effect. Such dramatists as Middleton, De Mille, Broadhurst, Shipman and Goodman were once students of Professor Matthews, Mackaye, Ames, Eaton, Corbin, Sheldon, Miss Dix and Miss Peabody students of Professor Baker. And I think that in every phase of the subject there have been practical results. Only the best results can come from such activity—results that will lead to the widespread appreciation of the best in drama, and to the most effective workmanship.

New York City.

# Applied Doctrine

BY MELLA RUSSELL McCALLUM

Were I a hooded monk in a monastery gray,
I'd open only half an ear to what folks have to say.
I wouldn't be deciding what was right and what was wrong,
Unless the provocation was unusually strong.
(Oh, dear, look coming down the street! It's Genevieve Jerome.
I think it's something scandalous the time that girl gets home.
Of course I know she works long hours, but it really looks to me
'S if she flirted on the corner with that Mr. Satterlee.)

Were I a hooded monk in a monastery gray,
I wouldn't always shake my head in horror and dismay
When I saw folks getting tangled in their frail domestic life.
I'd remember that they're human, and that man was born to strife.
(Oh, dear, it fairly drives me wild, the way my neighbors scrap.
Will you believe it—sometimes I can hardly get my nap!
They'll fight all day about a penny button on a blouse.
I really wish they'd get divorced, or rent another house.)

Were I a hooded monk in a monastery gray,
My heart would be compassionate toward all who went astray.
I'd credit them with struggling with all the strength they had,
For you never know the real truth and temptation's mighty sad.
And most o' the awfully good folks never want to be real bad.
(Oh, dear, there's tales and tales going around about May Lee.
And I'm afraid they're partly true, for she's wild as she can be.
To think a Christian neighborhood should have that dreadful smirch!
I almost hope that Elder Doane will put her out the church.)

Were I a hooded monk in a monastery gray,
My heart would beat for all the world, my lips would ever pray
Lest I set myself above folks, in ignorance of their sin,
Lest, safe within my sheltered nook, I shut the door and din:
"Go right away, you sinful soul—of course you can't come in."

Waterville, Ont.

# The World's Divorce Record

BY WILLIAM B. BAILEY, Ph.D.

Assistant Professor of Political Economy in Yale University.

THE size of this country and its pre-eminence in certain lines of production among the nations of the world appeal to the pride of the average American, but there are certain forms of pre-eminence in which this sense of national pride is likely to be somewhat tempered. One of these is divorce. The figures upon which this chart is based refer, with one exception, to the average annual number for five years ending in 1902 or 1903.

| Country | Number of Divorces | Per 100,000 of Population |
|---|---|---|
| Austria | 179 | 1 |
| France | 8,864 | 23 |
| German Empire | 8,628 | 15 |
| Great Britain | 743 | 6 |
| Hungary | 2,179 | 11 |
| Italy | 819 | 3 |
| Japan | 93,049 | 215 |
| Norway | 120 | 6 |
| Sweden | 390 | 8 |
| Switzerland | 1,053 | 32 |
| United States | 55,502 | 73 |

Japan alone surpasses the United States here. The United States with an annual number of over 55,000 has more divorces than all the rest of the so-called Christian world. The European nations in this list furnish less than half so many divorces and yet had a population in 1900 of more than 200,000,000. There is no European country with a divorce rate half as high as that of the United States, and in some countries divorce is almost unknown. In Ireland, for instance, there was but one divorce granted in the five years from 1899 to 1903. Whatever evils we may claim are brought upon this country by the large foreign immigration, a greater tendency to divorce is certainly not one of them. Whatever the cause, we do not need to search for it outside our own country.

# Literature

## The New Italy

A PROFESSOR in the Royal University of Rome wrote, some years ago, a study of contemporary Italy, its conditions and institutions.* For prudential reasons he threw his criticism into the form of letters written by a suppositious American resident. His book has, however, passed thru three editions, and the cat is out of the bag. As for the translation, tho without literary merit, it is of decided interest to American readers. It is even a book for which there exists a special demand. As the author writes, "The Past throws its shadow over the Present" in Italy; and most Anglo-Saxons go thither

"with the same sentiments which we would carry with us to Egypt, Mesopotamia, or Greece; that is, we come to see ruins and visit museums. . . . It is very natural that Italians are provoked at this preoccupation of our tourists, and they often return it by a cordial antipathy. They feel themselves to be a live nation, and they wish to be studied and judged as such."

The plan of the volume does not lend itself to terse statement. Yet these "letters of a Yankee" do contain much meat. In especial, the Italian fiscal system is vigorously and justly attacked. But that is not all.

"The lack of men with a practical and direct knowledge of business is felt thruout the whole public administration of the kingdom of Italy; of the 508 deputies I verily believe that at least four hundred are lawyers; there are very few bankers or business men, and even fewer agriculturists."

The bad fiscal policy is one result; the mistaken administration of the public treasury a second. Professor Garlanda charges also that the Italian Government has failed to meet the problem of the Campagna; its "timid, rickety law of amelioration . . . has cost the taxpayers a considerable sum, but the practical results are about zero." "For many years the Italian Government never remembered agriculture, except to tax it. . . . Even today, out of sixty-nine provinces, fifty-four are more or less infected with malaria." One hears a great deal of the tobacco and salt monopolies, and, in general terms, of Italy's overtaxation.

The system of land tenure (in so far as it admits of *latifondo*) comes in for censure here; so does the educational system, with its uniform and inadequate programs, and its inadequate salaries for teachers—sometimes as low as $120 per annum! Like many other institutions of the land, the educational system is a kind of inverted pyramid; primary instruction is neglected, while there are no less than twenty-one Government universities—of a sort. In discussing the ills of contemporary Italy the learned professor is fully as polemical as he is expository. His object is, doubtless, to stir up a "divine discontent." Let us not, then, fail to take his propaganda *con grano di sale.*

In conclusion, let us quote a passage from his chapter on "Colonies and *Irredentismo.*" This chapter is peculiarly apposite today, when Italy is seizing a territory three times the area of the peninsula. "If there is a nation in the world that should enjoy having its own colonies, it is Italy," writes this author. Next to Belgium, she of all the European nations has the densest population:

"But in reality it is more packed in Italy than it is in Belgium, because all of Belgium is a rich plain, cultivated or capable of cultivation, without mentioning the rich products under the earth and her manufactures; the soil of Italy, on the other hand, is mostly mountainous; in parts it is marshy. . . . Besides this, her population increases enormously by virtue of her prolificness.

"Now, how can any one seriously maintain that colonies would not be useful to a nation having these conditions? If Italy had had a colony of her own into which to pour the excess of her prolific and laborious population, it would today be an empire of forty millions; her industrial and commercial forces would be greater; above all, that conscious-

*THE NEW ITALY. A Discussion of Its Present Political and Social Conditions. Translated from "La Terza Italia: Lettere di un Yankee," of Federico Garlanda, by *M. E. Wood.* New York: G. P. Putnam's Sons. $1.50.

ness of collective power would be stronger, which is always favorably reflected in the energy of the individual. . . .

"So long as Italy has no vast colony of her own adapted to her inhabitants she is in the position of a man with an incurable disease, who loses every day a part of his blood and his strength."

## How the Other Half Lived

NOT since the Franceschini-Caponsacchi scandal was written up by Robert Browning in "The Ring and the Book" have we had a story so thoroly told from different viewpoints as it is in the Five Towns trilogy of which the second volume is now out.* The first volume dealt exclusively with the life and feelings of the hero (to use the old but no longer appropriate terminology). The heroine, Hilda, flashed into Clayhanger's life and then vanished, the most mysterious of her sex, startling and inexplicable in speech and action. *Hilda Lessways* is their explanation, but tho we understand her better, we do not love her more. She is a harsh and repellent heroine. Her lack of frankness may be condoned on the general law of the secretiveness of lovers, which acts almost automatically, causing them much misery which frankness would remove. A Cornell student of Shakespeare once said to Professor Shackford: "Why didn't Ophelia walk straight up to Hamlet and say, 'Hamlet, what's the matter? Tell me, and let me help you'?" "Ah," said the professor, "if Ophelia had been that kind of a young woman, there would have been no tragedy!"

Hilda alternates between senseless shyness and astonishing boldness, making her an uncalculable creature, puzzling to the reader and to herself as well as to Clayhanger. But all the time Arnold Bennett sits in her brain, watching its devious workings, and looking out of her eyes sees the world about her as she sees it, just as he crouched in the corner of Edwin's soul in "Clayhanger."

The scenes where they meet are again described in the same detail as before and the conversations are word for word the same, but the incidents look altogether different and the remarks have quite another significance from this new standpoint. With marvelous skill the author brings out the contrast between the way they regard each other and their own conception of themselves. Clayhanger thinks himself a timid, ineffectual, vacillating youth, crushed from childhood beneath the dominant personality of his father. Hilda has similarly felt herself repressed by her mother and lacking in individuality and initiative. But when they meet each appears to the other a powerful and original individual, independent in thought and daring in action.

Arnold Bennett says of Hilda in her first ardent adventure: "She had slipped out for a moment from the confined and stifling circle of *domestic dailiness.*" Those words describe the essence of his art. The "domestic dailiness" shows its psychological side of intense inner drama. "She began to perceive that this that she was living thru was life." It takes years for Hilda Lessways to find out just that, but it takes most of us quite as long. There is an immense expectation in youth that soon life is going to begin, that it is just around the corner waiting to pounce upon us. Hilda Lessways has a dramatic sense of the importance of the events that touch her personally, and a sympathy, genuine enough, albeit often harshly exprest, for those who suffer. She has a gift for attaching responsibilities. Yet she is not an attractive young woman, with her alternate impetuosities and reserves, her frown at the world and her secretiveness toward those she loves. This volume is also less interesting than the first in that it has none among its minor characters so remarkable as Edwin's father, who played a prominent rôle in the first.

We are promised a third novel which will continue the history of Edwin Clayhanger and Hilda Lessways after their marriage. The chronicles of the Five Towns may go on endlessly, but they are always interesting. Mr. Bennett has discovered that the obscurest life is absorbingly interesting to itself; and it is this vivid sense of hidden drama which holds our attention no matter how externally monotonous the story may be. Nobody's story is dull to himself and Mr. Bennett, without adopting the cheap

*[illegible] By Arnold Bennett. New York [illegible] $1 50.

device of using the first person in letters and diary, shows us how things look from the inside. Like the favored auditors of the Elizabethan playhouse, we have seats on the stage as near to the actors as one person can ever be to another.

**The Mother of Parliaments.** By Harry Graham. Pp. xii, 314. With Twenty Illustrations. Boston: Little, Brown & Co. $3.50.

There is an obvious reason for giving a cordial welcome to Mr. Harry Graham's *The Mother of Parliaments*. Ten years ago there did not exist a single good history of either the House of Lords or the House of Commons, or of the representative system in England. The history of Parliament in all its aspects was a subject which had been singularly neglected by English historians of the last half of the nineteenth century, and this despite the accumulating volume of material for a history of Parliament that had in this period become easily available. With the beginning of the present century, however, this long neglect of Parliament came to an end, and within the last ten years histories have been published of the House of Commons and of the House of Lords. At least two of the histories of the House of Commons have been written on this side of the Atlantic; and the fullest and most scholarly history of Parliamentary procedure is the work of an Austrian. The standard history of the House of Lords is the work of an English student; but until Mr. Graham's *Mother of Parliaments* was published, notwithstanding this new interest in Parliamentary history, there was no single volume in which was embodied a history of both the House of Commons and the House of Lords. Mr. Graham has given no sustained or systematic attention to the franchises on which the House of Commons was or is elected. Only incidentally does he allude to either the new or the old representative system. But he has written an exceedingly interesting popular history of the two Houses of Parliament; and it is because his book covers both the House of Commons and the House of Lords that it is likely to meet an obvious need. Students of English constitutional history will continue to use the monographs on the representative system, on the House of Commons, on the House of Lords, and on Parliamentary procedure which have been published during the last ten years. For these students Mr. Graham offers nothing that is new. He goes over ground that is familiar to them; but for the general reader Mr. Graham has done a real service. He has emphasized the lighter, the picturesque and more personal aspects of Parliamentary history and Parliamentary life, and has woven into his book a serviceable story of the development of political parties and of the Cabinet, and his book also contains a particularly good popular history of the old and the new Palaces of St. Stephen's.

**Letters of Sarah Orne Jewett.** Edited by Annie Fields. 12mo, pp. 259. Boston: Houghton Mifflin Co. $1.50.

Not many, since Cicero, have been able to write easy, charming letters about nothing and everything; and one who could was Sarah Orne Jewett. In her younger literary career she began to write regular letters, which would almost constitute a diary, to her friend, Mrs. Fields, with many a criticism of books and authors, and many a dear touch of the loved life about her home in South Berwick, Me., which she has pictured in "Deep Haven." Our eye falls on the description of a call one evening of John Lord, the popular lecturer on history, who was, like her, a native of the town. He rambled on about his visit to England in his younger days, his interviews with Cardinal Wiseman, Carlyle and others, and she concludes:

> "Egotism is the best of a man after eighty. He is chiefly valuable then for what he has been and for the wealth of his personality; and what is silly self-admiration at forty is a treasure of remembrance. The standpoint has changed."

But the letters are not all to Mrs. Fields. They are addrest also to literary friends here, like Mr. Aldrich, or to Mrs. Humphry Ward, whom she met in England, and to not a few others, but with the marked omission of any to her family, who had her most intimate love. We warmly commend the volume to any

of those who have loved one of the purest and most tranquil of all our better writers, and to others who would enjoy the touches of description of a multitude of literary celebrities, all told in that pellucid style which flows easily thru fresh meadows of epistolary conversation.

**Home Rule Speeches of John Redmond, M. P.** Edited with an Introduction by R. Barry O'Brien. New York: Frederick A. Stokes Company. Pp. xl, 348. $2.50.

At the present moment, when John Redmond stands out as one of the most prominent political figures in the English-speaking world, the publication of this volume of speeches is especially timely. No politician is personally more widely known on both sides of the Atlantic than the leader of the Irish Nationalists, for no other man of such prominence in his own country has appealed on the platform to the public of the whole English-speaking world. In Australia and New Zealand, in Canada and the United States, John Redmond is a familiar figure, and the echoes of the cry of the purchase of the British electorate with the "American dollars" which he took back from his recent tour in this country and Canada have hardly yet had time to die away. John Redmond is an excellent platform figure. His speeches not only to the public, but also in the House of Commons, are both good hearing and good reading. Without reaching the highest flights of oratory, Redmond is a speaker who commands the attention of his hearers, and his speeches in print will bear close examination. They are not immoderate in tone, in spite of the depth and intensity of feeling which he throws into them, and it is not possible seriously to impugn the accuracy of his statements of facts. It must be acknowledged that the case he makes out for the self-government of Ireland is unanswerable. It is the fashion among the English Unionists to assert that Irishmen are unfit for self-government, that they are unable to work representative institutions with fairness. To this John Redmond makes the crushing reply that the government of Ireland could not possibly be worse conducted than it is at the present moment, with the English in full control of Dublin Castle and of all the governing machinery. Ireland is a notoriously poor country, yet its Lord Lieutenant is paid a salary of $100,000 a year. The salaries of the judges are proportionately high. The number of public officials is ridiculously out of proportion to the population and resources of the country, and their salaries are on an extravagant scale. Ireland is encumbered—it is scarcely correct to say ruled—by sixty-seven boards or departments, centering in Dublin Castle, but many of them responsible to no one and none of them responsible to the people of Ireland. The number of officials—more than half of whom are useless and superfluous—amounts to 100,000 and their salaries to $15,000,000 a year. The outcome of all these boards and all these officials is that the real government of Ireland is wofully neglected. Nothing is done for the development of either industries or natural resources. Harbors are neglected and allowed to silt up; great areas of land are allowed to run to waste for want of drainage schemes such as are instituted in Holland and in parts of England. Public buildings are erected without regard to their utility or the convenience of the people. Irish railways are allowed to charge the highest freight rates in the world; and worst of all, the education of the people is starved and neglected. The facilities for education in Ireland — primary, secondary and university—are miserably inadequate, and only 55 per cent. of the children of school age are attending school.

**Margery** By E. F. Benson. Garden City, New York: Doubleday, Page & Co.; $1.20.

Mr. Benson has added a delicately finished portrait of an egotist to his gallery of character sketches. Arnold Levison is so unconscious an egotist, so fastidiously selfish, that he exasperates and attracts at the same moment. Margery, who is drawn by affectionate impulse toward all living things, chooses most unhappily to fall in love with this man whose real passion is for Athens and Egypt and for no human woman. Mr. Benson has drawn a most attractive person in Margery, whimsical, loving, and

most appealing in her selflessness and goodness. That such a sunny wave of joyous girlhood should break upon such a stone as Arnold is one of the mysteries Mr. Benson makes no attempt to explain. A manlier lover than Walter Morrison no author could hope to portray, but Margery's need of loving is so much greater than her desire of being loved that she gives her gentle heart to the lesser man, who loves himself in pathetic unconsciousness of his own poverty of nature. There is humorous delineation of minor characters in Mr. Benson's best vein of satire. And Margery is a most lovable woman as well as a "happy-hearted Tanagra figurine."

**The Life of Robert Louis Stevenson.** By Graham Balfour. Abridged Edition. New York: Charles Scribner's Sons. $1.

The life of Stevenson by Graham Balfour, somewhat abridged, now makes its appearance in the small-volume Biographical Edition. It gives us the essentials, from the ancestors and the "Covenanting childhood" down to the end in the far South Seas, where the romancer now lies buried under a stone inscribed with verses of his own:

"Under the wide and starry sky,
Dig the grave and let me lie.
Glad did I live and gladly die,
And I laid me down with a will.

"This be the verse you grave for me:
*Here he lies where he longed to be;*
*Home is the sailor, home from sea,*
*And the hunter home from the hill.*"

Stevenson is read now, seventeen years after his death, no less than during his lifetime; and this sympathetic account of his life, written by his cousin, will in the new edition win him more readers yet.

**Alpine Plants of Europe,** together with Cultural Hints. By Harold Stuart Thompson, F. L. S. With 64 colored plates (311 figures), 8vo, pp. xvi, 274, with map. New York: E. P. Dutton & Co. $3.

There is a peculiar fascination about the collecting, and especially the cultivating, of Alpine plants. What can be more gorgeously blue than the gentians that show a solitary stout upright bell rising scarce two inches above the chill soil of a Swiss mountain side? Such are the gentians Bavarica, verna, and Clusii. Then there are half a dozen and more pigmy pink primulas, one of them a farinosa, much in cultivation. Nearly a dozen blue campanulas—snow loves blue—lift or hang their bells, the dearest of all pusilla. Nor must we neglect the Linnæa, which may be found in some of our own cold swamps, which the Swedish botanist chose to bear his own name. Over three hundred mountain plants of Europe are well figured in the colored plates of this most attractive and instructive volume, which is desirable for the botanist, the horticulturist, or the visitor to the various mountain resorts of Europe. All needed directions are given for the culture of these plants. Hardly a more attractive book comes to our table.

## Literary Notes

....From Appleton we receive a popular treatise on air craft and aeronautical meterology by Dr. A. F. Zahm (*Aerial Navigation*).

....*St. Paul's Friendships and His Friends* (Gorham Press) are discussed at some length by Rev. Carl Hermon Dudley, who gives much material that might be used for homiletical purposes.

....A complete translation of Geiger's brilliant lectures on *Judaism and Its History* (Block; $2) has been made by Charles Newburgh. Altho delivered nearly half a century ago, these lectures, now for the first time published entire in English, have still a lively interest.

....For readers of the *Notes and Queries* type who delight in picking up stray bits of curious information on the borders of history, F. J. Snell's *Customs of Old England* (Scribners) will prove an attractive volume. Church and school provide most of the material.

....For purposes of comparison readers will find a helpful book in Frank J. Firth's *The Holy Gospel* (Revell; $1), which is an arrangement of the Authorized English Revised, American Standard, and Douay Versions of the four gospels in parallel columns. A short history of these versions precedes the text.

....Two daintily made anthologies come to us from Thomas Y. Crowell Company ($1 each): *On Life's Highway*, a book of verse for presentation to school graduates "who have received their equipment and are to begin their journey," compiled by E. A. Bryant, and *Poems of Friendship*, compiled by John R. Howard.

....The Glasgow Repertory Theater opened its autumn season ten days ago with Arnold Bennett's comedy, "The Great Adventure," which is founded on his novel "Buried Alive." In its dramatic form this is a

"fresh and witty comedy founded on a farcical case of mistaken identity, and conducted later, on the comic plane, to a fourth act which is a masterpiece of high comedy."

....From Harper's comes to us James Oppenheim's latest: *The Nine-Tenths* ($1.25), similar in theme to his former books, but differing in that it is a novel. Here one finds an account of a disastrous conflagration of last spring, the shirtwaist makers' strike, and other matters of the "human muddle," including experiences of those who seek to remedy the ills of the present industrial system.

....Of interest to students will be *A Study of Tindale's Genesis Compared with the Genesis of Coverdale and of the Authorized Version* (Holt), by Elizabeth Whittlesey Cleveland, Ph. D., in which is shown by means of extended comparison the debt of the Authorized to Tyndale's version. The Introduction contains discussions and notes concerning words and grammatical usages peculiar to Tyndale.

....From the Government Printing Office we receive the *Calendar of the Papers of Martin Van Buren.* This volume extends to 757 pages and is prepared "from the original manuscripts in the Library of Congress by Elizabeth Howard West, Division of Manuscripts." The book is illustrated from the painting of Van Buren by Huntington, and the *Calendar* is very fully indexed. The preliminary work was done by Mr. Worthington C. Ford.

....Americans should soon know what good criticism is—criticism of the modern kind, that is. Messrs. Dutton & Co. are issuing Sainte-Beuve's essays, and have already reached volume viii of the *Causeries du Lundi.* The translator and annotator is Dr. E. J. Trechmann, and the price per volume fifty cents. The present volume is not one of the most important. Essays on the Cardinal de Retz, Rivarol, La Harpe and Perrault are none the less included there.

Other readers as well as young ministers will find a large amount of wisdom and keen observation served up in a spicy way with plentiful dashes of humor in *Letters to a Ministerial Son* (Pilgrim Press; 75 cents), by "A Man of the World." These "Letters" appeared originally in a London religious weekly and have called forth many guesses as to their authorship. Whether layman or cleric, the writer evidently knows his subject and the way to present it in an attractive fashion.

....Five addresses delivered by Rev. Charles Reynolds Brown before the faculty and students of the Teachers College have been made into a book bearing the title *The Modern Man's Religion.* In these addresses the new Dean of the Yale Divinity School treats such themes as Truth and Life, Incomplete Knowledge, and Fellowship Thru Service with vigor and clarity of style. (Columbia University; $1.)

....From England it is reported that the Duke of Argyle has been asked to edit the correspondence of the late King Edward, which, when finally arranged, will form his biography "under authority." Queen Alexandra was desirous of taking a personal hand in the work, and, with King George, will have the responsibility of going thru a vast mass of material, much of it necessarily of a character too private for publication.

....We cannot altogether regret the fact that ill-health prevented Miss Mary Taylor Blauvelt doing as much literary work as she had intended when she left America and her schoolroom behind and took up residence in an English university town. The essays which she collects under the title, *In Cambridge Backs,* are the compensation: and they range from academic subjects like The Writing of History to good old-fashioned essay-themes like Friendship and Immortality and The Artistic Temperament (Sherman, French & Co.: $1.20).

....The encyclopedic edition of *Webster's New Standard American Dictionary* is strikingly different in appearance from its rivals in that it is printed in large bold-faced type, generously spaced, so there is no strain on the eyes in using under any circumstances. Illustrations, plain and colored, are plentiful, more than one to a page, among them an up-to-date plate of different types of aeroplanes. But it is a misnomer to have the name of Webster given to a book that gives no encouragement to spelling reform. (Chicago: Laird & Lee; $3.)

....The publication of the gossipy autobiography of Madame Toselli, former Crown Princess of Saxony, recently reviewed in THE INDEPENDENT, has been much discussed in Germany. Great curiosity was felt as to what action the Saxon court would take in view of the publication, since the contract under which the former Princess receives an annuity of nearly $10,000 contains a clause restraining her from publishing anything against her former husband. It is understood, however, that the King decided at once to take no notice of the book.

....*America* has fallen foul of the Irish players and playwrights. They bring us no Gaelicism, says a certain Father Kenney there, but only "Gallic decadence." This Jesuit critic, who shows great cleverness in his attack, would persuade us that Mr. Yeats is an imitator of Maeterlinck, Lady Gregory a secondary Ibsen, the late John Synge a lesser Baudelaire. We wonder if he has really persuaded himself of all that!

....Another organ of American Catholicism, the *Sacred Heart Review*, tackles the Irish playwrights a little more gingerly. "The complaint is justly made," says this periodical, "that the Yeats and Synge school of dramatists take what is abnormal in Irish character and present it as typical. That there is beauty in these plays may be admitted, but it is not in all cases the beauty of truth."

The Catholic Church, in attacking the new Irish drama, thru its press, is only following out the line of its literary tradition. As Mr. Calvin Winter points out in the current *Bookman*, eight of Balzac's novels were forbidden to good Catholics as early as 1841; seven more were added the following year. There was a pause till 1864, when all of Balzac fell under the ban. The same edict that condemned Balzac put "Les Misérables" on the list—followed "Nôtre Dame," and George Sand's works up to 1863. The works of the two Dumas, in every language, stand condemned. Zola escaped censure until the publication of "Lourdes" in 1804. The following year came a second edict which tersely disposed of the case: *Opera omnia*.

....Mr. Winter retells a pretty story of Pope Leo XIII and d'Annunzio, who for many years escaped the censure of the Index. When the question was raised of placing d'Annunzio's writings upon the Index, and this fact came to the ears of the Pope, "What is this, what is this?" he asked of the secretary of the Index. "You are thinking of prohibiting the works of Signor d'Annunzio?" "Yes, your Holiness," answered the secretary. "Don't do it!" rejoined his Holiness emphatically. "I sometimes like to do a little reading myself, and Signor d'Annunzio is the only living author who can write decent Italian!" The reasons for sentence being passed are never given in the Index, but are manifold. Milton's "Paradise Lost" is on the Index, but the censure applies only to an Italian translation by a certain Paolo Rolli, who inserted a preface containing a discussion of Voltaire's essay on epic poetry. If anything is established by all this, it is that the Irish playwrights, in being damned by clergy, are introduced into excellent company!

## Pebbles

PRIDE is all right if you don't let it interfere with your work.—*Atchison Globe.*

"O, MOTHER, why are the men in the front baldheaded?"

"They bought their tickets from scalpers, my child."—*Chicago Tribune.*

WHAT is a pessimist? Well, there is one in this story, told by the Cleveland *Plain-Dealer:*

"I had a mighty queer surprise this morning," remarked a local stock broker. "I put on my last summer's thin suit on account of this extraordinary hot weather, and in one of the trousers pockets I found a big roll of bills which I had entirely forgotten."

"Were any of them receipted?" asked a listener.

The listener was *a pessimist.*

PAT, thinking to enliven the party, stated, with watch in hand: "I'll presint a box of candy to the loidy that makes the homeliest face within the next three minutes."

The time expired, Pat announced: "Ah, Mrs. McGuire, you get the prize."

"But," protested Mrs. McGuire, "go way wid ye! I wasn't playin' at all.—*Ladies' Home Journal.*

RECENTLY in Seattle in a cigar stand appeared the sign, "We give $15 for 1909 Lincoln pennies." No less a person was attracted by this than Judge Watson. He walked up to the counter and laying down a penny triumphantly asked for $15. The clerk took the penny, examined it closely, asked if it were genuine, and after several minutes sighed and said he guessed it was good.

"Certainly it is," answered the Judge. "Where is my $15?"

"Where," said the clerk, "are the other 1908?"—*Life.*

EASY PAYMENTS.

I bought me a home on a plan
  A real estate agent devised.
I labor as long as I can,
  I earn and I pay; I am prized
As one of those chaps who are strong
  On paying out coin they may get.
I dwelt in my purchase full long—
  I haven't quite paid for it yet.

The house that I bought is no more;
  'Tis gone with its closets and halls.
The windows fell in on the floor,
  The plaster dropped down from the walls.
I've changed, and I've builded anew,
  The old place I almost forget—
But tho it has vanished, 'tis true,
  I haven't quite paid for it yet.

Oh, schemes there are, large ones and small,
  To capture the coin that is free;
But this is the peer of them all—
  This home selling plan that got me.
Forever and ever and aye,
  I cough up my cash—and I'll bet
With my last dying breath I will say,
  "I haven't quite paid for it yet."

—*Chicago News.*

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Trust Commissions

In the course of some remarks about the Trust problem, on September 28, we asked: "Is it not possible by official supervision and regulation to gain for the people and the country the advantages of consolidation and concentration, and at the same time to prevent the wrongs as to which complaint is so justly made?" It seemed to us that the compulsory disintegration of a great manufacturing combination, and the restoration of competition among its separated parts, would not necessarily be beneficent to the public and the nation, and might cause considerable loss. We also said:

"The subject is one that might reasonably and profitably be submitted to a carefully selected commission, which should inquire not only concerning conditions here, but also as to the policies of other nations which are dealing with the same problem."

This was not the first time that the appointment of a commission to make careful and thorough inquiry about the great incorporated consolidations which are commonly called Trusts had been suggested in The Independent. The suggestion was renewed because of the evident determination of the Government to prosecute a considerable number of corporations simply because they are consolidations of concerns that once were independent and competing, and to require a dissolution of them in order that competition among the parts may be restored; also because of that "doubt and distrust among investors," of which Mr. Taft has spoken in one of his recent public addresses.

In an interesting contribution to the discussion of this Trust question, Mr. George W. Perkins has since asked for the appointment of such a commission. He was speaking, on the 4th inst., before the Detroit Chamber of Commerce. Mr. Perkins, formerly one of Mr. J. Pierpont Morgan's partners, has been prominent in the management of the Steel Corporation and the International Harvester Company. A few months ago he began to withdraw from active business, intending to give much of his time to the study of projects for the benefit of great industrial corporations' employees. But the only subject of his address at Detroit was the nation's policy concerning Trusts.

At the election of 1908, he said, the people supported the party whose platform asked, as follows, for amendment of the Sherman Anti-Trust law:

"Experience has shown that its effectiveness can be strengthened and its real objects better attained by such amendments as will give to the Federal Government greater supervision and control over, and secure greater publicity in the management of, that class of corporations engaged in interstate commerce having power and opportunity to effect monopolies."

He quoted passages from Governor Hughes's attack upon the Trust plank in the Democratic platform, one of them being as follows:

"It is the function of law to define and punish wrongdoing, and not to throttle business. In the fields of industrial activity the need is that trade should be fair; that unjust discriminations and illegal allowances giving preferential access to markets should be prevented; that coercive combinations and improper practices to stifle competition should be dealt with regardless of individuals, but that honest industry, obtaining success upon its merits, denying no just opportunity to its competitors, should not be put under prohibitions which mingle the innocent and the guilty in a common condemnation. The line of progress lies not in arbitrary action, but in securing suitable publicity and supervision, and by accurate defi-

mitton of wrongs and the infliction of proper punishment."

After the election, however, Mr. Perkins continued, Congress enacted no amendments; it neither defined the wrongs not provided for suitable publicity and supervision. This is true, but it was not understood that the platform required definition of Trust wrongs or any change in the words of the Sherman act. Something additional providing for supervision by means of Federal incorporation or otherwise was indicated. Mr. Perkins errs a little in asserting that the Republican party is now "carrying out the Trust plank of the Democratic platform." The Republican Government is enforcing the Sherman act, "full enforcement of which," Mr. Roosevelt said, "would destroy the business of the country."

It is impossible, Mr. Perkins says, for any large interstate industrial company to know definitely whether its form of organization is legal or not. Senator Cummins's opinion is that "the extent of lawful restraint cannot be known by a business man until he is prosecuted and his case reaches the court; he does not and cannot know as he proceeds with his business whether he is a good citizen or a criminal." But this is not true of a great many business men, altho some may justly complain of uncertainty. Mr. Perkins points to the promotion and expansion of our export trade by great corporations, saying that the export sales of two companies alone have increased in ten years from $20,000,000 to $100,000,000, and that dissolution or disintegration would seriously affect this foreign trade. It is true that export shipments have grown under the management of great combinations, but Mr. Perkins must know that the growth has been due in part to the practice of selling abroad at prices lower than those which the combinations exact from the American people. The practice should be discontinued. Such discrimination is unjust. This part of his argument can have little weight with the American public.

As we have said, he suggests the appointment of a commission of inquiry. He thinks such a commission would recommend the establishment of an executive commission, to which any group of men planning to extend a business enterprise from one State to others and across the seas might apply:

"My belief is that these men should go to our Federal Government and at least lay bare their plans, expose their capitalization, their methods and their objects; that they should agree that at stated intervals they would submit to the Government complete statements as to the operation of their business, so that the Government in turn might say to the labor employed, to the consumer served, and to the investor, that the statements these men are making are complete and honest."

We think there should be a commission of inquiry, and we believe such a commission would ask Congress to make an executive commission, like that which is now concerned with the affairs of railroads. But an Interstate Trade Commission would not undertake to guarantee the "honesty" of a great company's operations or the value of its shares. It would seek to prevent injustice, and insist upon that publicity which in itself tends to regulate the conduct of a corporation. Supervision might be exercised effectively by means of Federal incorporation and in other ways. Revision of the Sherman act would be required, and, of course, would be recommended by a commission of inquiry. The President and the courts are bound to enforce the present statute, which, if Mr. Taft's and Mr. Wickersham's views of the recent decisions and opinions be correct, is hostile to many corporations simply because competition among their component parts was silenced when they were organized.

## The Intellectual Mood

THE moods of the folk-thought change like the moods of the sea. Calm and storm follow one another in the public mind, and popular ideas form themselves into shifting patterns, as the waves of the ocean do. One day they are a choppy sea of chaotic fancies; another day the resistless roll of an emotional disturbance. And now and then they smooth out to the broad expanse of deep but unruffled intellectual interest, on which the commerce of our material and our moral life rides safely and moves swiftly to its port.

The weather signs today promise a

return to the intellectual mood, and happy will it be for the world if they do not fail. It is long since any great tempest has rolled up the long swell of profound popular emotion. Nothing comparable with the vast movements which we know as the Protestant Reformation, the American Revolution, the French Revolution, and the American Civil War, has been witnessed by the generation now in middle life. The folk-thought of our time has for the most part been a choppy sea of fads and fancies, of broken creeds and traditions, swishing and swashing with innumerable heresies and fantastic varieties of "new thought." At intervals the intellectual mood has intervened; and once, in the latter half of the Victorian Age, it lasted so long that the world made more progress in knowledge in thirty years than it had made in two thousand years before. Our outlook upon the universe was changed, and the means wherewith to make man comfortable, if not altogether happy, were brought within our grasp.

It is an interesting experience to turn over the files of the scientific publications of forty years ago. As we look back upon those days, we see that Darwinism and the Spencerian theory of evolution were not only making their way among educated men with marvelous rapidity, but also that they were affecting the ideas of the masses to an extent that was not then realized. And yet the expectations of the more optimistic were destined to quick disappointment. The human millions of Europe and America did not forthwith forget their superstitions and become patient scientific investigators. They cared for the new ideas while they were new, but tired of them when the stimulus of novelty had spent its force. Then began confusion and unrest, and men turned to the pursuit of those material advantages and to the enjoyment of those pleasures of sense which scientific achievement had placed at their command. In a life of extravagant indulgence and insatiable desire the intellectual toil which had made the new things possible ceased to appeal.

The signs of reawakening interest in the intellectual life are not numerous as yet, but they are real and are multiplying. In college and university circles there is everywhere a thoughtful condemnation of tendencies which have been disintegrating intellectual discipline. There will be a return to standards, to intelligent selection of courses, to insistence upon intellectual effort and achievement. In the press there is a noticeable increase of respect for knowledge, and of intelligent handling of subjects within the domains of science and scholarship. Managing editors do not permit their headline writers as often as they did a few years ago to display the utmost possibilities of an asinine originality. In national and State governments there has grown up a genuine regard for the scientific expert, and the recent disposition of the case of Dr. Wiley, revealing, as it has done, an unmistakable popular realization of the importance of scientific integrity in departmental work, is altogether encouraging, as is also the popular demand for commissions to investigate present conditions before the enactment of laws.

Even more significant, as we think, is the new note which may be detected in the utterances of men whose business it is to take part in discussion and to mold public opinion. Until recently there has been a discouraging absence of intellectual appeal. In the volume of talk about social and economic problems, insistence has been laid upon "doing" this or that. The assumption has been that, if external conditions could be changed, or the social organization in some way remodeled, mankind could easily enough be made happy. Not only have we been told that the poor man is quite as good a fellow as the prosperous man, but we have been assured also that the ignorant and the stupid man could give quite as good an account of himself as the educated man, if he only had "a chance." It is heartening to see that here and there a public speaker is plucking up the courage to talk plainly about this particular kind of drivel. The ignorant man is the chief danger in any social situation. He has always been, and he always will be; and no plan of social reorganization, individualistic, socialistic or communistic, will ever work out in satisfactory results unless the campaign against ignorance is

waged with ceaseless and untiring determination.

We are not indulging in predictions, but, as observers of the folk thought, we are happy in being able to report that the mental weather map looks better than it did.

## Mr. Roosevelt and Panama

It was in March last that ex-President Roosevelt, in California, speaking about his action concerning Panama and the Panama Canal, said:

"If I had followed traditional, conservative methods, I would have submitted a dignified state paper of probably two hundred pages to Congress, and the debate on it would have been going on yet; but I took the Canal Zone and let Congress debate, and while the debate goes on, the canal does also."

Those who have thought that he was incorrectly reported on that occasion may now read the following paraphrase of those remarks in his defense of his action in *The Outlook:*

"If I had observed a judicial inactivity about what was going on at the Isthmus, had let things take their course, and had then submitted an elaborate report thereon to Congress, I would have furnished the opportunity for much masterly debate in Congress, which would now be going on and the Canal would still be fifty years in the future."

We also quote a characteristic passage, which fairly indicates the general tone of his defense:

"Of course there was at the time, and has been since, much repetition of statements that I acted in an 'unconstitutional' manner, that I 'usurped authority' that was not mine. These were the statements that were made again and again in reference to almost all I did as President that was most beneficial and most important to the people of this country, to whom I was responsible, and of whose interests I was the steward. The simple fact was that when the interest of the American people imperatively demanded that a certain act should be done, and I had the power to do it, I did it, unless it was specifically forbidden by law, instead of timidly refusing to do it unless I could find some provision of law which rendered it imperative that I should do it."

A treaty is, or should be, law for a President of the United States. There has been "much repetition" of the statement, not that he acted in an "unconstitutional manner" and "usurped authority," but that he violated a treaty in which the United States "guaranteed" Colombia's "rights of sovereignty over said territory," meaning the Isthmus of Panama. There has also been repetition of the statement that his action was in violation of the recognized principles of international law. These are the statements by which Colombia supports her petition for a submission of the controversy to the Hague tribunal. As Mr. Roosevelt is convinced that there was "no more honorable chapter in the history of the United States," and that it "is foolish to claim that Colombia is entitled to one dollar because of that transaction," he should not, of course, object to arbitration which, if he is right, would simply give him worldwide vindication and confound all who have criticised his course.

The patent defense of President Roosevelt's course is that the treaty with Colombia had nothing to do with internal war. We were obliged to defend Colombia against foreign aggression, but not against secession. That is plain. When the United States had secured the succession to the French rights in the Isthmus, Colombia made extravagant claims and refused a concession. Thereupon, with no incitement on our part, Panama seceded from Colombia. It was to the advantage of the United States to recognize the secession, and this President Roosevelt did with full right. But then Colombia attempted to subdue the rebellion, and was about to send an army, when Mr. Roosevelt forbade it, and sent forces to prevent it, on the ground that we had large property interests there, railroad, canal, etc., which would be imperiled by war. By major force he did not allow Colombian soldiers to come within fifty miles of the canal.

That our Government was in sympathy with the secession, was glad of it and took advantage of it to do what we would have been glad to do with Colombia, there is no doubt, but our Government had given no aid to the secession itself. The question at issue is as to whether, after the secession, we had the moral right to forbid fighting there, with the result that Colombia could not by war recover possession. It was hard on Colombia, but Colombia had played no wise part in refusing a treaty, and she had to suffer. We cannot see but that

we had the right to forbid fighting where we had large rights of property and person, and we took advantage of conditions which we had not created. The most that can be said is that Americans in Panama sympathized with and helped the secession, but that could not be helped, and was quite within their rights. It was a revolution which justified itself.

If, now, Colombia still thinks that she has suffered deep injury from the United States and demands indemnity, we do not see any reason why this country should not allow the case to be referred to the Hague tribunal, and indeed it ought to be. We see no reason to condemn Mr. Roosevelt for his part in the transaction. He acted positively, vigorously and at the instant and with success, to the great advantage not of the United States alone, but of every one of the republics of North and South America, Colombia included, and of the world; and if he has seemed to boast a bit of his vigor, and to tell us that devotion to the end will not allow us to condemn the means, it is proper to interpret his words charitably and not represent him as confessing to having done evil that good might come.

## Industrial War

We hear much in these days of industrial war. It is well to have a clear idea of what is meant by the term. We know what war is between nations. It means killing one another until one nation is tired of having its citizens killed and its cities burnt, and gives up and submits to the terms which the stronger imposes; or both nations get tired of the losses involved and they agree to terms to stop the killing and burning.

Now is this the kind of war we have in mind when we speak of an industrial war? Or is the word used figuratively to represent a sort of conflict which has to do with words and disputes over conditions of industry, over refusals to work and refusals to employ labor? In order to secure the end sought in an industrial war is the wilful killing of people included when other means fail? This is a very serious question, and we are brought face to face to it by the later developments of what is called industrial war. The question then is, Is this a real war or a figurative, rhetorical war?

Perhaps the highest representative of organized labor, its selected spokesman before the courts, is Mr. Clarence Darrow. In his article in *The American Magazine* of last month he has much to say of industrial war. He tells us that it is based on utter selfishness on both sides; that there is nothing ideal about it, but that it is necessary and inherent in the present social and industrial system. This war, he tells us, must go on to the end; for each side, the employer and the laborer, is selfishly determined to get the best for himself that he can; but Mr. Darrow does not answer the question—he seems to avoid it—whether or not this is a real, literal war of killings when necessary for success. Yet the fact that he is the ablest defender of those tried before the courts for being responsible for killings, would lead one to conclude that it is literal war that he would defend.

Laborers demand the closed shop for the success of their unions and the protection of its members. We allow that they have the right to demand the closed shop and to strike if it is not allowed, as Mr. Darrow argues; but what we want to know is whether killing with dynamite, and the shooting of non-union men is legitimate in an industrial war. Of course killing is illegal, but Mr. Darrow tells us that the employers do a multitude of illegal things in constructing their vast combinations; but that, under present industrial conditions, they cannot help themselves; that they have to combine, law or no law; and we may not be unfair in the conjecture that he would equally apologize for, or even defend, the illegal killing of men under the stress of industrial war.

And the history of strikes seems to bear out this conclusion, that those engaged in it regard it as real war, a literal war of classes. It is a terrible conclusion to reach. It is one that may overthrow our social system. "We did not make the social system," says Tom Mann. "If the bottom falls out of it, that is no concern of ours."

We pass the Los Angeles murders and the case of McNamara whom Mr.

Darrow has been selected to defend, and look at the last case, that of the Illinois Central and Harriman Lines strike which reaches as far South as New Orleans. A number of workmen — or we may call them scabs or strike-breakers, were taken to McComb City, Miss., to do the work which for a very good reason, perhaps, the old and competent workmen had left on strike. Then followed riots there and at other points further South. We do not suppose it will be claimed that at McComb City, at New Orleans and elsewhere it was the boys or the local hoodlums who entered into a real war of violence and murder in which many people have been killed or fatally wounded. It was the strikers themselves who not only profited, or hoped to profit, by the war, but who were its army. So violent were they that the mayor of McComb City took the unusual course of compelling the strike-breakers to be taken from their work and out of town for fear that the strikers would kill them.

We are not just now defending or condemning those who, on either side, incite an industrial war; we only state the fact that in the minds of a large number of the union workmen, particularly of the Socialist or Anarchist faith, to call it a war is no longer a figure of rhetoric but a literal fact. We have got to familiarize ourselves with this understanding with whatever of social revolution it may involve; for Tom Mann tells us that those he represents did not make the present social system, and that if the bottom falls out that is no concern of theirs.

In this connection we may call attention to one of President Taft's late speeches on his Western trip. He declares that industrial combinations must be broken up; for we must return to competition, or fall to Socialism. We are not so sure of the alternative.

## The Public Cup

We are inclined to believe that the prevailing crusade for the prohibition of cups at public drinking places belongs to that class of hasty legislation due to a failure to look at the effect of a measure from both sides. Legislation always involves a choice between two evils and in this case one evil, the danger to the public health thru the spread of contagion, is undeniably real and striking, while the other evil, the lessening of water drinking, is no less real but not of a nature to be so easily demonstrated by specific instances. In such a case, the public is aroused to the more spectacular evil and endeavors to remedy it by force regardless of the effect upon the other tho it may be the greater. It seems to us that a generous consumption of water between meals is so essential to health that it is very dangerous to interfere with it in any way.

The ice water tank is one of America's greatest contributions to civilization. It is a most powerful influence for temperance, much more effective than purely negative and restrictive measures. It has resulted in a lesser consumption of alcohol and a larger proportion of abstinence than in any other country outside of Islam. The doctors, who sometimes follow rather than lead in hygiene, say much less nowadays about the injury of ice water to the digestion than formerly and prescribe it in certain cases, as in fevers, where once they prohibited it. Abroad America has been chiefly known in the past by the cocktail, because the vices of a country are always those first borrowed by other nations, but now the ice-water tank and its ally the soda fountain are conquering Europe and beginning to exert their beneficent influence there as well as here. Nowadays when our friends return from abroad with an acquired taste for wines, "because, you know, we could not get drinking water anywhere," we know they are lying, whereas we only suspected it formerly. We do not accuse the brewers and saloonkeepers of having furnished funds to bribe state and municipal authorities to promote the anti-public cup movement, but it is undeniably in their interests to do so and they have not usually been reluctant to spend money in their own behalf.

Of course, if whenever a common cup is removed by law some substitute were obliged to be provided, little could be said against it, but this is not likely to be the case. Public watering places are not likely to be maintained and new ones

established if a constant additional expense for cups is to be imposed. Nor is it probable that the custom of carrying private pocket cups will become universal in the near future, and if it is always necessary to drop a penny in the slot to get a drink poor people and children will often go without it. The effect will be bad even upon those who always have pennies in their pockets. For having taken the trouble and gone to the expense of getting the water they will naturally drink down the cupful at once, which is the wrong thing to do. Ice water should be taken frequently and in small quantities instead of rarely and much at a time.

We have been interested in the new forms of drinking fountain, hoping that some of them would solve the problem, but we confess disappointment so far. The physical structure of man does not seem adapted to drinking upward. A favorite feature of the old-fashioned circus was "the human siphon," a man who could drink with his head inverted, and it is not likely that the trick will be acquired by everybody. But it is as good as a circus to watch the novice trying one of these new-fangled fountains. There is always an exciting uncertainty about whether the squirt will seek entrance at the eye or at the nose.

A more practical expedient would be the use of straws. Drinking thru a straw is the neatest way of imbibing a liquid and also the most enjoyable, for it extends the area of gustation. For iced drinks it is particularly desirable, because the teeth are not chilled and the thirst is satisfied with a smaller amount. Straws are cheap enough to be supplied abundantly, and by using them one can drink with comparative impunity from the foulest cup, because the disease germs to be feared are not usually in the water, but smeared on the edge of the cup by the lips. Contact of the mucous membrane with the cup can also be easily avoided by holding it just below, instead of above, the lower lip.

As we advance in civilization the use of personal and perishable utensils and apparel becomes more extended. This progress is, however, better promoted by increase of knowledge of real hygiene and the revision of the rules of etiquet than by general compulsory measures. The boundary line between public safety and individual rights is vague and shifting. Our own inclination in such doubtful cases is always toward the greatest allowable liberty, whether it is a matter of physiological or of moral prophylaxis. We are opposed to the theatrical billboards which force vulgar pictures and incitements to vice on every passer-by, but we do not urge the establishment of a censorship of the drama. We want all foods and drugs correctly labeled with what they contain and how they are made, but we do not think it right to prohibit the use of any ingredient or process unless it is clearly proved to be harmful. A wide margin should always be kept between what is inadvisable and what is prohibited. Those who do not want to avail themselves of the common cup at railway stations and public buildings are not obliged to.

The use of individual cups at communion is a good custom, and we hope it will be extended to all Protestant churches. At the communion service where one chalice is used every one is virtually obliged to partake or to confess himself either an unbeliever or a victim of some contagious disease. It would not look well for the fearful or fastidious communicant to whip out of his pocket his collapsable cup and help himself from the tankard.

The common cup should also preferably be banished from the schools, provided always that adequate substitutes are furnished. It was the custom in "the little old red schoolhouse on the hill" or "in the dale" (depending on which rime was wanted for the second line) to get water in a pail or bucket (according to locality) and carry or tote it around and serve it at every desk with a dipper or gourd, as often as the teacher would grant permission. This was probably the reason why every childhood disease that was introduced was expected to go the rounds of all who had not had it, and generally did. But it is of doubtful advantage to the health of the community to banish all public cups unless other means of getting water as freely and conveniently are introduced in their place.

## Duchesne and Rampolla

Mgr. Duchesne, Director of the French Academy which occupies the second floor of the Farnese Palace in Rome,—the seat of the French Embassy,—enjoys a rather unique status in regard to his erudite and well-known "History of the Ancient Church." Originally it appeared in French and with the *imprimatur* of the Dominican Lepidi, who is Master of the Sacred Palace and hence the official censor of the Vatican. Its great success led to an Italian translation. Thereupon troubles began for its author. The Anti-modernists of Italy with the *Unita Cattolica* of Florence in the van, began a rabid onslaught on the work, which ended in a partial success. In this affair of Duchesne, who meanwhile was elected one of the Forty Immortals, is witnessed a curious ecclesiastical anomaly. It is the duty of the Index to condemn books, and yet the History of the learned Frenchman has escaped the ban, while it has been rejected by the Consistorial Congregation. For the first time since its creation this Congregation has claimed for itself the duties and powers of the Congregation of the Index. That it could rightfully do so, is at once apparent, when we recognize that its Prefect is the Pope himself, the fulness of all power. Again, the condemnation takes on a mild form. It invites the bishops of Italy to exclude Duchesne's History from all their seminaries. True, the Sub-Prefect, Cardinal De Lai, wrote a strong denunciation of the work, yet instead of an interdict the circular contains a mere request, which, however, no bishop will overlook; at least during the lifetime of Pius X. In fact, the letter may be called an interdict, altho at the same time the author is not obliged to recant and withdraw his writings. Condemned and not banned, a rejected book and a faithful author, it had received the required imprimatur, and had afterward been allowed by the decision of a well-known historical writer to whom its examination was entrusted, but with the reservation that it was better adapted for the learned than for untrained readers. Now it is to be excluded either as a textbook or a book of reference in the libraries. At present the interdict applies only to Italy, but will doubtless be extended elsewhere, so that it would be well for "levites" here to make haste to read it before the book is forbidden them. The reasons given are: Certain reticences on subjects relating to the supernatural; the elimination of a host of martyrs who are spoken of as fanatics, while their persecutors were men of genius influenced by political ideals; the disparagement of certain of the Church Fathers; and the conflicts with heretics at times represented as controversies over quibbles. Indeed, the honor paid to the Blessed Virgin, the unity of the Church and the state of the Roman Church are not adequately emphasized. It is regarded as not safe to let students preparing for the priesthood know what even reputable Catholic scholars believe. What sort of an education is that which gives a faith unexercised and unproved?

All this merely proves that the circular is the result of pretty bitter feuds. Cardinal Rampolla has ever been the stanch friend and defender of Duchesne. In fact, it was only after Rampolla had left Rome and gone to Einsiedlen near Zurich, that the circular appeared. No doubt it is as much a defeat for the Sicilian Cardinal as for the French scholar. This circular is a pretty sure omen that Rampolla will not be the next Pope. At present the College of Cardinals is small with a majority opposed to Rampolla. Its three most influential men, Dal Val, Vives y Tuto, and De Lai, are bitterly determined to keep Leo XIII's Secretary of State from being Pope. These three are *oscurantisti* of the straitest sect; the first the son of a Spanish diplomat by an Irish mother, the second a Spanish Capuchin friar, the third a secular priest who began life as a curial *minutante* and has always been in Curia, rising at last to be Cardinal.

Another point evident from the condemnation is that the Papal Censor, Lepidi, is shoved aside. His office belongs to this order—Dominican, and the circular letter is but one more proof that the Jesuits are downing their life-long enemies—the Black Friars of St. Dominic.

It will be no great surprise, however, if Duchesne's History, both in French

and Italian, is put on the Index. We ourselves believe that from Rome's standpoint the work should be banned, for it is no doubt bold, if not heretical. The brilliant Frenchman has put an interrogation mark after many, if not most, of the Church's historical dogmas. If condemned by the Index, Duchesne will probably submit, but his defender, Rampolla, seems destined never to wear the Tiara. The Consistorial circular is the first straw to show how the Conclave wind may blow.

Meanwhile the reports as to Pius X's ill health are more specific. We would not depend upon them except that the private news that comes to us from what ought to be trustworthy sources confirm them. We are told of his serious loss of memory, and the practical abolition of audiences, so that even Cardinals must offer the gravest reasons to see him. Of course, Cardinal Dal Val is a daily visitor. The Pope lives in the second story of the Vatican, and in descending he uses the elevator to avoid meeting any one. At the same time we are informed that he stands a good chance to live quite a long while. Of course, he is most tenderly cared for, and everything is done to maintain his physical strength.

**The Failure of General Reyes**

Immediately after his return to Mexico, Gen. Bernardo Reyes promised, at a conference attended by President De la Barra, to support Madero and to take office in his Cabinet as Minister of War. Some time afterward, yielding to temptation, he broke the agreement and became a candidate for the Presidency. This breach of faith must have convinced the Mexican people that he was unfit to be nominated for any office. Probably a large majority of them saw in it sufficient evidence of his unworthiness. The recent course of General Reyes has been disappointing and is much to be regretted. Madero is not the greatest or wisest of men, but he was the logical candidate of the revolution and he deserved to be elected. Reyes, if he had been faithful to the conference agreement, could have given him valuable aid and thus would have served his country well.

**A Chicago Report**

It is rather surprising to learn that the post office authorities have forbidden the report of the Chicago Commission appointed to consider and advise on the social evil to be sent thru the mails. There is in the report nothing to promote immorality, but quite the reverse. It tells plainly what the evil is, its extent, and the protection it receives from the police. It calls bad men and women by their proper designations, but with all the accounts of typical cases it gives no names or places. It is a report to startle easy-going respectability and to make the citizens of Chicago ashamed of the disgusting vice which is discovered; and it ought to lead to legislation and other actions to abate it. What is there printed is no worse than will be plainly said in public in Columbus, Ohio, October 23-27, at the meeting of the American Purity Federation, the society which has made such a fight against the white slave traffic. The campaign against the social evil in Iowa, and particularly in Des Moines, has had remarkable success, proving that it can be suppressed. Its suppression means not so much the cure of the morally tainted, altho this is not impossible, but the saving from corrupt influences of a growing generation of young people, and the multiplication of the number of marriage and of decent homes; for prostitution has always been the great foe to marriage.

**Columbus Day**

There is coming to be one serious objection, we are sorry to say, to the celebration of Columbus Day as a holiday, and that is, that it is being made a sectarian day. There is nothing sectarian about Independence Day or Labor Day or Thanksgiving Day. They are good for Protestants and Catholics and Jews alike, and even Jews make the Christian Christmas seem one of their celebrations. So Columbus Day might be and should be a day for all of us to honor the discoverer of America; but it is being perverted to be a specially Catholic holiday, a day to magnify the glory of the Catholic Church. Altho the Catholic order of the Knights of Columbus has sought the enactment of it as a legal

holiday in thirty four States, it was not presented to these legislatures as sectarian. Not only do the Catholic organizations devise the great processions of the day, but we observe that the Catholic newspapers are treating it as specially their day. Thus the Boston Pilot, owned by Archbishop O'Connell, says:

> Every Catholic man who is in a position to do so, should take part in the great parade of Columbus Day. It should be a source of pride thus to make public profession of the faith that is in him. He should not be deterred by false human respect. In honoring the great discoverer he is paying tribute to the faith that prompted and still prompts greatness of character, high ideals and noble achievements."

In a second editorial *The Pilot* urges the value of the day for Catholics, saying that "to us as Catholics it bears a special significance," and that to the Catholic it brings "a special thrill of enthusiasm." Such a special right in the day does not encourage the remaining States to adopt it. In this connection we may mention that, on the presentation last Sunday of a tablet in honor of Governor Dongan, the first Governor of New York, set up in St. Peter's Church, in this city, Archbishop Farley had the bad taste, in the presence of Governor Dix, to say that we ought again to have a Catholic Governor, and that no other would as safely protect the liberties of the people.

**A New Profession**

The formation of a Civic Secretaries Committee by the National Municipal League brings out clearly the development of a new career for young men who would devote their services to public work and at the same time earn a livelihood. Just as the charity organizations and the business associations need professionally trained secretaries, so the lengthening list of city clubs, municipal leagues and civic federations learn that they cannot depend upon spasmodic, voluntary effort if they are to amount to anything. There was a time when enthusiasts felt that all that was really needed to change conditions was to form a league or an association, adopt a platform that ran trippingly from the tongue, raise a few war-whoops and "the trick was done." Now we know better. Our cities are coming to be served by a group of voluntary bodies which, guided by thoughtful and efficient men, are contributing largely to the solution of difficult municipal problems. The City Clubs of Boston, New York, Philadelphia, Chicago and Kansas City are a quintet of organizations serving as nuclei, around which city-wide movements have been formed and are forming. Their activities call for high-grade civic secretarial work. The voters' leagues likewise require men of judgment and discernment, courage and foresight. There are improvement associations and civic commissions and federations and sundry other bodies, all manned by those who may reasonably be termed civic experts; moreover, business bodies are coming to retain civic secretaries to look after their increasing civic activities. The National Municipal League's Committee is but a year old, but already its membership exceeds forty, which is an encouraging evidence of the growth of this "new profession." The committee serves as a clearing house for its members. Reports, advices and suggestions are freely exchanged for the benefit of all; but, above all, it promotes an *esprit de corps* in civic affairs that promises to be of the largest usefulness to the civic movement.

**End of Prize Fighting**

Some do say that the reason why the authorities forbade the fifteen rounds boxing bout between the American boxing champion Johnson and the Englishman Wells was because it was feared that if Johnson won the bout it would arouse the Kaffirs of South Africa to insurrection against their white rulers. We prefer to believe that the reason was a worthier one: that it was because this was to be no simple practice of skill, but the bloodiest kind of a brutal, knockout fight, and that is an offense to decency and morality. To be sure, Mr. Chesterton says there is no great wrong in two men pummeling each other if they want to, and that the evil of it is that people should pay money to sit and see it, instead of fighting in a manly way themselves. That is characteristic of a man who loves to say paradoxical things. He

would have it that we are not as manly as our fathers were in the good old days when knights contended in the jousts with their swords, and the Robin Hoods and Friar Tucks with their quarter-staves and single-sticks; but we do not see but that athleticism has a very fair contingent of adepts in these days, even if we have better ways to prove courage and endurance than by killing each other.

**Dry Farming**

The predominant French trait, says Stendhal, is vanity, which shows itself in resenting any possible superiority of others. A curious example appears in Algeria. Having heard much of the success of dry farming in the arid regions of America, the French Government of Algeria sent to this country a commission, in charge of M. Malcor, to study the conditions here. On his return he reported that excellent results were achieved, and plans were made to introduce the system in the semi-arid portions of Algeria. His mission and publications made a profound impression, but not what might be expected. While statesmen approved, the agriculturists were passionately opposed to any change. Some professors of agriculture opposed, and the bulletin of an agricultural society printed a furious article against dry farming. It said to the French colonists: "Do just as you have been doing. Don't waste your time searching for the philosopher's stone. Leave these new ideas for the Utopians." Everywhere thru the colony is heard the same chorus: "Take notice that all this noise is made to create more functionaries"; or, "We already know all the Americans can teach us." Fortunately, the Governor will make the experiment, and, in the old way of learning, "*probat ambulando,*" the test will settle it.

**Foreign Phrases**

No habit affected by certain Americans is more laughable than their misuse of French phrases when they are trying to express themselves in English. An English clergyman, who stayed in Paris five months in order to polish his accent, was asked if he had occasion to speak a great deal of French. "No," he replied, "but in my sermons French expressions will come to me, you know, and it wouldn't be just *comme il faut* not to give them the right accent; would it now?" But this is no new folly, nor is it confined to Englishmen and Americans. Especially in the world of sports and "extra-snob" society, do French folk use English coinage. They even sing out *play* and *forty love* when practising the game of tennis—derived from the old French *jeu de paume.* No wonder a reaction has set in, and "The Friends of the French Language" have organized themselves to combat the use of English frills and phrases. Why, argue the "Friends," say *smoke room* and *interview* and *flirt* (always, by the way, meaning the man in the case) and *footing* (meaning "walking") when perfectly good French words express the ideas involved? No reasonable person can wish to root out those borrowed words which, better than any native expression, convey one's meaning. Thus *trust* will remain good French, and *chauffeur* good English, however the words may be mispronounced. But there never can be a good excuse for interlarding one's conversation with foreign inventions used precisely because they *are* foreign.

**"Boston—1915"**

This means that by that date Boston proposes a well planned city; better homes at a minimum rental; absolute protection for health and life; the prevention of crime, disease and degeneracy, at least of slum congestion. It proposes also recreation for the people, thru well organized work, and that reaction which takes place by the study of art and music—while playgrounds of course are included for the children. This will require the economic use of all public buildings, churches and school houses specifically included. The school system will be reorganized on the basis that boys and girls are to be trained rather than fed with facts; that they must be trained to do for themselves efficiently and to accomplish their work as citizens. It will not be possible to carry out large social ideas unless we can educate our coming generation to apprehend and cooperate. The Boston proposition deter-

times also to establish a better and wiser relation between workman and employer. We believe this to be quite within the range of possibilities, and we have no faith at all in that pessimism which looks upon labor and capital as naturally inimical. In short, Boston proposes the implanting of a true spirit of civic patriotism in the mind of every member of the community; announcing its absolute faith that "the city can enter upon a new era of social life—co-operative in the fullest sense of the word."

Other great questions have been settled by the *ipse dixit* of the Pontifical Biblical Commission. They are those which relate to the Gospel of Matthew. It is declared that the Apostle was the author of the Gospel that bears his name; that it was originally written in Aramaic; that it was translated into Greek before Paul returned to Jerusalem, and so before the prophecies of the destruction of Jerusalem were fulfilled; that Matthew wrote the Gospel as we have it and not merely a collection of our Lord's sayings expanded by a later editor; that the statements made in the Gospel are all trustworthy, and have not been dictated by any desire to accommodate facts to prophecies about the coming Messiah; and, finally, that full credit must be given to the account of Christ's birth and infancy, to the passage on the primacy of Peter, to that on the formula of baptism (28:19, 20), and "the profession by the Apostles of their faith in the divinity of Christ" (14:23). It is so restful to be told what to believe.

It is not pleasant to observe how the trial begins of those guilty of the lynching and burning of a negro in Coatesville, Pa. The district attorney began with bringing to trial two boys not out of their teens. They could hardly have been among the most guilty ones, and it is not so very strange that the jury should have been merciful to them and acquitted them. But it is a bad beginning. Such an atrocious crime could not have been committed without adult leaders, and they are the ones who should have been first brought to trial, the world will think. We see these acquittals, and then the endorsement of the Republican primary which makes the indicted Chief of Police candidate for an elective office. All this gives lovers of justice anxiety. We could not have imagined that Chester County, a seat of education and culture, could first commit such a crime, and then fail to punish it.

It was all right when Senator Stephenson was spending his money freely to elect Mr. La Follette, but when he spent $107,000 to secure his own election to the Senate it was bribery. We cannot doubt that the money was used illegitimately in both cases. He must have known that the men into whose hands he put all this money must have spent it in corrupt ways. There are laws that limit the amount a candidate can spend, and such a law they ought to have in Wisconsin.

Following the law of the State of Indiana, Notre Dame University forbids its students to smoke cigarets, and Columbia University also has a rule against smoking on the college grounds. We wish these rules might be made effective there and in other similar institutions. But we observe that the more stringent government of West Point and the Naval Academy cannot prevent the students wholly from hazing and securing intoxicating liquor.

The so-called aerial post is not an innovation, any more than the taxi-meter, that was known to ancient China. Fifty years ago postal balloons drifted between Metz and Paris; forty years ago the English post office made a successful experiment with a postal balloon at the Crystal Palace; during the siege of Paris by the Prussians mail bags were carried by balloon from the capital to Tours. Ecclesiastes, I, 10.

A debt of gratitude is owed to the directors of the Cambridge (Mass.) Young Women's Christian Association, who have ruled that a woman is a young woman until she is thirty-five. Will some one in authority be so kind as to tell us when the graduate of a college for women ceases to be a "girl"?

So far the Turco-Italian war is less fatal than aviation.

# Insurance

## Policy Loans

We have in the past commented on the evil of policy loans. The extent of these loans increases rapidly. In 1902 the companies in New York State had $60,000,000 of policy loans in their assets. At the end of 1910 these figures had increased to $265,000,000. In outside companies the policy loans increased from $47,000,000 to $175,000,000 in the same period. Many causes have been advanced for this increase, such as hard times, speculation, real estate development and the purchase of automobiles. The fact remains that the loans represent an unwise business practice, and that despite the discouragement of the privilege by the insurance companies the evil constantly increases. In a recent address by Mr. Preus, a Minnesota insurance expert, the following significant remarks were made:

An insurance company undertaking to loan on demand a sum on every policy outstanding approaching the amount of the reserve on such policy is not only encroaching on the realm of banking, but is subordinating its true function of protecting families in order to assist speculators and indiscreet citizens, and thus steering its craft upon an uncertain sea. The time has gone by when we would think of asking for the termination of the policy loan practice, but there is no reason why this feature of a policy should be permitted to destroy the purpose of the insurance contract.

Cologne, Germany, with a population of 517,000, has not had a total loss in a dwelling house in many years. Nearly all the fires which break out are confined to the rooms in which they originate. There are no wooden structures in Cologne, and all new buildings erected must be of brick, stone or concrete, and absolutely fireproof. Wooden stairways are permitted only in single dwellings of not over two stories. The fire losses in Cologne are less than one-tenth those of the ordinary American city of the same size.

A tabulation of dividends paid to stockholders of life insurance companies of the United States during 1910 shows said payments on that account amounting to $1,251,055. One hundred and eleven companies are listed, with an aggregate capital of $32,746,180. Sixty of the companies paid dividends to their stockholders, the average rate being 5.6 per cent.

Joseph Leiter, of Chicago, who acquired fame by his spectacular career as a speculator in grain, has the largest personal accident policy on record, amounting to $250,000. The policy is with the Travelers' Insurance Company, of Hartford.

The "Olympic," which collided with the cruiser "Hawke" near Southampton recently, is insured in London for $5,000,000. The terms of the policies provide that the underwriters shall pay only in the event of a claim exceeding $750,000.

A life insurance company is to be organized in San Francisco to insure Chinamen exclusively. They are going after the business which American companies have been getting in the past. A Chinaman is a good risk.

There is almost twice as much life insurance in force in the United States today as there was ten years ago. The assets of the companies, taking into consideration the new companies as well as the old, have more than doubled.

The Supreme Court of Massachusetts has rendered an opinion, signed by five judges, declaring that the workmen's compensation bill before the Senate is constitutional. It is anticipated that the measure will now pass into law.

Governor Dix, of New York, has signed the bill extending for another five years the time in which life companies must dispose of their stock investments.

A Pennsylvania man hid $700 in a stove, then his wife lit the stove. He said he had lost faith in banks and in insurance.

# Financial

## Trusts and the Market

Owing to the President's public addresses, to legal proceedings, and comments of the press, the securities market continued to be affected, last week, by the attitude of the Government toward incorporated combinations engaged in manufactures or trade. Brief reference to the week's events and reports is made below:

*Steel.* Reports from Washington of impending suits against the Corporation for violation of the Sherman and Elkins acts. Other reports that the independent companies will combine if the Corporation is not prosecuted.

*Wall paper.* Nine prominent manufacturers or wholesalers indicted at Cleveland for violation of the Sherman act, one of the defendants being W. A. Huppuch, Governor Dix's partner, chairman of the New York Democratic Committee, and member of the New York Public Service Commission.

*Harvester.* President McCormick says he is confident that the company will meet the requirements of the Government.

*Tobacco.* Many rumors about the dissolution plan. Louis D. Brandeis employed by independents to protest if the plan should preserve the Trust's power.

*Anthracite railroads.* In a brief, on appeal, the Government takes a new line of attack.

*Cotton corner.* Action taken by the Government, on appeal from the quashing of parts of the indictment.

*Lumber.* Black list produced in Missouri suit against Southwestern Association. Eastern States Association filed answer in Government's suit.

*Florida Railway Company.* This corporation sues the Seaboard Air Line and several financiers, under the Sherman act, asking $6,000,000 damages.

*Burley Pool.* Renewal, for ten years, of this combination of growers of tobacco by means of a contract with James B. Haggin.

*Electrical, Southern Grocers, and Powder.* Reports that each of these prosecuted combinations has submitted a satisfactory plan of dissolution.

At the same time several merger projects were announced, each one involving suppression of competition. A combination of iron interests in Alabama, to be capitalized at $30,000,000, is under consideration; also a combination of Northwestern lumber mills, capital $40,000,000. The merger of nine copper mining companies with the great Calumet and Hecla has been abandoned, owing to appeals to the courts in Michigan from certain minority stockholders. Officers of the Calumet and Hecla assert that the combination would permit economies of production and promote conservation of mineral supplies.

A well known writer on financial topics asserted, on the 3d, over his signature, that Mr. Wickersham, before he became Attorney-General, was employed by the Steel Corporation to examine its organization and operations, and to give an opinion as to whether in any way the Corporation violated the Sherman Anti-Trust law; that he criticised "only some trifling details," and that "the blemishes he discovered were eliminated." As no denial has since appeared, we assume that the statement was a true one.

*

....Deposits in our postal savings banks at the end of August were about $2,500,000. It is estimated that now the total exceeds $4,000,000.

....Representative Sims, of Tennessee, gives notice that at the coming session of Congress he will introduce a bill to abolish the new Commerce Court.

....Official tax reports show that about 10,000 motor cars, for which about $12,000,000 was paid, are owned in Kansas. It is said that more than half of them were bought by farmers.

....The value of our farm lands, according to a recent report of the Census Bureau, has more than doubled in the last decade, rising from $13,051,033,000 in 1890 to $28,383,821,000 in 1910.

....Italy's exports of cotton cloth to Turkey have grown rapidly in the last few years. This trade will be checked by the war. American exporters hope to get a part of it. It is asserted that the exporting Italian manufacturers have excited prejudice in Turkey against American cottons by selling cloth of poor quality under counterfeited or closely imitated American trademarks.

The Independent

VOL. LXXI NEW YORK, THURSDAY, OCTOBER 19, 1911 No. 3281

# Survey of the World

**Mr. Taft's Travels**

At Bellingham, Wash., the President said, last week, that if all went well the Panama Canal would be open to traffic by July, 1913, altho that is promised only for January, 1915.——On October 13, after speaking at Sacramento, Cal., on the Nicaraguan and Honduran loan treaties, giving reasons why they should be ratified by the Senate, Mr. Taft reached San Francisco. That night, at a banquet, he paid a tribute to ex-President Roosevelt's "promptness and energy" in the matter of the Panama Canal. Next day he broke ground at the site of the Panama-Pacific Exposition. A military and naval demonstration was followed by music and speeches. Governor Johnson, of California, is an insurgent, and it is interesting to note his formula for the introduction of Mr. Taft: "Ladies and gentlemen, the President of the United States." No name, no adjectives. San Francisco newspapers comment on the warmth of the President's reception.——Mr. Taft traversed Mount Rainier National Park, Washington, in an automobile, notwithstanding the bad condition of the roads. At one moment he came within 2 feet of going over a precipice 1,000 feet high.——In Seattle, Wash., the President addrest an outdoor audience of about 15,000 persons on his arbitration treaties. At Tacoma he returned to the subject of Alaska, saying, in part:

I made a speech in Seattle two years ago on the government of Alaska. My impression was that Alaska will not make progress until it has a local government that may act upon all local needs. I then said I did not think the people of Alaska were of sufficient solidarity to justify turning the government over to them, and I would prefer a commission government like that we had in the Philippines. That has not met general approval. I still think that would be the better way."

Yet he would concede, he added, "a part elective and part appointive government." There ought to be no politics in the action of Congress as to Alaska; only regard for proper development. He said:

'I confess that I see no reason for departing from the ordinary rules in respect to Alaska that we have in other parts of the public domain. That is, I see no more reason for government ownership there than elsewhere. I think we may introduce there the same disposition of that domain that we have introduced elsewhere. I am in favor of the leasing system. I find that they have the leasing system in Australia, New Zealand and Canada, and that it has worked well."

——Mr. Taft took advantage of his opportunity to inform himself upon the workingmen's compensation law, in Washington. He spoke of this at Olympia, saying:

"I want to congratulate you on the progressive legislation which you have adopted in this State. I am especially interested in the act providing for workingmen's compensation. It is a subject that we have been considering at Washington and which is now under examination by a special commission appointed by Congress. That they will look into the operation of your Washington statute goes without saying, and I have attempted to elicit from the Governor and have obtained from him a great deal of valuable information as to the statute, its operation and its beneficial effects."

——In two towns in the State of Washington Mr. Taft referred to woman suffrage. At Centralia, while it was still supposed that the constitutional amendment granting the vote to California women had been defeated, he said:

"I see that they defeated the suffrage in California yesterday, so that you still remain the largest State with the largest number of women contributing to your government. The whole world will watch your experiment to

see how it is coming out and what good effect the suffrage may have. I do not know how it is in your families. Josh Billings used to say that the man who consented to be a lieutenant on his wedding day was never promoted. My experience is that where the man is the lieutenant the family is best governed. I dare to say that in the presence of a great many ladies who will agree with me. Whether the men do or not is not important."

At Castle Rock, Wash., he said that the success of woman suffrage "depends upon the women."

"If they are going to exercise the suffrage and be careful about it and give the attention that men give to it, then I have not any doubts about the result. I am looking forward with a great deal of interest and a great deal of confidence to what the women of Washington do, and I sincerely hope that the problem that has been entered upon with so much courage by you will be properly solved and will justify what you have done, and then of course all over the country we will follow you."

——After reports to the contrary, it became known last Friday that, by a majority of at least 2,000, California had given the suffrage to women, the vote being 119,880 for, 117,779 against. The vote, for the constitutional amendments providing for the referendum and recall (including judges) were 138,181 to 44,850, and 148,572 to 46,290, respectively.

**The Opposition**

Gifford Pinchot, who has been touring in Alaska, expected to reach Chicago in time for the anti-Taft Republican conference of last Monday. Ex-Senator Beveridge will not return from Europe in time to attend, and has avoided expressing himself as to the conference. Senator La Follette, in whose interests this meeting of about 400 progressive leaders seems to have been planned, was expected to assist; as also Senators Borah, Bristow, Clapp and Cummins. "President Taft will not be renominated," the Iowa Senator said last week.——According to Chicago reports, Republican insurgents stand ready to spend $2,000,000 to found a national organ, to be published in that city, beginning in November. A quarter of that sum was pledged a week ago, it is alleged.——Senator La Follette will make two trips into the Middle West this fall in the interests of his candidacy for the Republican Presidential nomination. He will first visit Iowa, Minnesota, Nebraska, North and South Dakota, Michigan, Illinois, Missouri and Oklahoma. Later he will go to Indiana and Ohio. The Wisconsin Senator will travel on a special train. He plans to make ten big speeches, setting forth progressive principles and the choice of delegates to the national convention by direct vote.——Participation in the Chicago conference by James R. Garfield, Secretary of the Interior in the Roosevelt Cabinet, was not originally contemplated by that gentleman. His change of heart is said to have followed a consultation with Mr. Roosevelt.——Woodrow Wilson, Democratic Governor of New Jersey, said in part at Red Bank, N. J., October 11:

"You have heard the President speak about the execution of the anti-trust law. You have heard the Attorney General quoted with regard to that. Do you know what either of them is going to do? Do they themselves know what they are going to do? They have everybody guessing, their friends included, and you cannot conduct sound business upon a test of guessing. This country is backing and filling, backing and filling, under an Administration that never defines what it is going to do. This country should insist that affairs should be taken charge of by some persons with definite opinions and absolutely unconquerable resolution, and then say what they are going to do, and do it."

The next day, before the undergraduate body of Princeton University, Governor Wilson repeated his denunciation of the Administration.

**At Washington**

John M. Harlan, Associate Justice of the Supreme Court of the United States, and its oldest member, died of acute bronchitis at Washington, October 14, aged seventy-eight years. He was the one member of the court who dissented from the recent "rule of reason" decisions against the Standard Oil and American Tobacco companies, and had been ill less than a week. When the President chooses Mr. Justice Harlan's successor he will have named an actual majority of the Supreme Court. ——The food committee of the National Consumers' League, sitting at New York last week, commended the President for exonerating Dr. Wiley, and urged the removal of Secretary Wilson,

Solicitor McCabe and Associate Chemist Dunlap.——The Review of Reviews Company, magazine publishers, last week filed a petition in a suit in equity against Postmaster-General Hitchcock and Postmaster Morgan, of New York City, asking that the defendants be restrained from enforcing the new postal regulation for forwarding monthly and bi-weekly periodicals by fast freight instead of on regular mail trains, thru Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa and Missouri.——The Postmaster-General advocates in his annual estimates a parcels post, for which he asks an appropriation of $50,000 to cover the preliminary expenses of establishing a parcels post on rural mail routes, and an equal amount to start the parcels post in the city delivery service. Another new item in the estimates is one of $50,000 to cover experiments in the delivery of mail by aeroplane.

**Cuba and Other Islands**

Two Cuban Senators and nine Representatives, acting as a committee of the political supporters of Vice-President Zayas, called upon President Gomez, on the 14th, and told him they had information of a conspiracy to assassinate Zayas, Gen. Pino Guerra and Congressman Marquetti. They warned the President that if one of these men should lose his life during the campaign they would hold the Government responsible. He replied that he knew nothing of such a plot, but had heard rumors of a similar conspiracy with which several members of this committee were said to be connected. He paid no attention to such stories.——The two new ships of Cuba's navy—the protected cruiser "Cuba," 2,200 tons, and the training ship "Patria," 1,200 tons—were launched on the 10th at the Cramp Company's yard, at Philadelphia. Four of President Gomez's daughters were present. Miss Mariana was sponsor for the "Cuba" and Miss Narcissa for the "Patria." The cost of the ships is about $750,000. ——Near Santiago, last week, bandits captured Jennings S. Cox, Jr., general manager, and Pedro Aguilera, mining engineer, of the Spanish American Iron Company. Demanding $20,000 ransom for Aguilera, they released Cox in order that he might procure the money. He returned from Santiago with armed men, and in the fight which ensued Aguilera escaped from the bandits, uninjured. Two of the outlaws were captured.——There is abundant proof that the "Maine" was not wrecked by explosion of her boilers. These have been found intact. A little more than half of the wreck can be floated and thus removed from the harbor.——In Santo Domingo an earthquake, on the 6th, ruined the town of San Juan de la Maguana. An American customs inspector, assisted by the Agricultural Department at Washington, is teaching the natives near the Haytian boundary how to cultivate the soil in modern ways. Not even plows have been in use there.——In the Philippines, the constabulary have killed Otoy, a noted outlaw for the last thirty-two years in the island of Samar. He was the last chief of the Pulajanes.

**Nicaragua's American Loan**

Nicaragua's Congress, on the 9th, approved the loan project by a vote of 25 to 6. President Diaz and War Minister Mena had threatened to resign if approval should be withheld. The loan, which is to be $15,000,000, was negotiated by Ernest H. Wanda, the American financial adviser of the Government, with Brown Brothers and J. & W. Seligman & Co., of New York. The money is to be used in refunding the foreign and internal debt, building a railroad and establishing the gold standard. Nicaragua's foreign debt is $4,628,385 and her internal debt a little more than $5,000,000. Nearly all of the foreign debt is owed to the Ethelburga Syndicate, of London, and the British Government recently gave notice that interest must be paid on October 21. A treaty pending in the Senate at Washington relates to this loan. Speaking at Sacramento, Ca., on the 13th, Mr. Taft defended this treaty and the similar treaty with Honduras, together with the policy which they represent.——Following approval of the loan, Congress approved the election of General Mena to succeed President Diaz. Fernando Solorzano will be Vice-President.

**The Situation in Mexico**

Mexico's Presidential electors voted on the 15th. There are a great many of them and the decision concerning a vice-president could not be promptbe ascertained. After asking Dr. Gomez to withdraw in favor of Suarez (which Gomez refused to do), Madero asked the Catholic Party's committee not to press for the election of De la Barra, saying that a political controversy might lead De la Barra to reject the Cabinet office of Minister of Foreign Relations. The committee decided that it would continue to support De la Barra, altho he had publicly declared that he would not accept the Vice-Presidency. A proposed constitutional amendment, approved by the States, ratified by the Senate and soon to be ratified by the House, will disqualify him. The Catholic Party decided to vote for Gomez, if De la Barra should be ineligible. Its committee asserted that De la Barra had 42 per cent. of the electors, Suarez only 30 per cent., and Gomez the remainder. Gomez, in a public address, predicted that Madero would ruin himself by trying to force Suarez upon the people, as Diaz had lost by compelling them to take Vice-President Corral. Madero will retain several of the present members of the Cabinet. De la Barra may accept the first place, but for four months to come he will be in Italy as special ambassador. The remainder of the list will probably be as follows: Interior, Suarez (candidate for Vice-President); Finance, Ernesto Madero; War, General Salas; Communications, Manuel Bonilla; Fomento, Rafael Hernandez; Justice, José Tagle; Education, Jesus Magon. Madero told General Reyes's son, last week, that he would guarantee the general's safety if he would return to Mexico.——In Chiapas, last week, the rebels (most of them are Indians) were severely punished. In a battle on the 9th thirty were killed; in another, on the 11th, 130 were killed and 106 captured. Three days later a peace agreement was signed.——In Morelos, Puebla and Guerrero, States near the capital, the Zapatists have not been subdued, altho 1,500 of them were routed, on the 9th, in Guerrero, by the army. They have burned railroad bridges, robbed railroad trains and looted ranches.——A great storm has caused much loss of life and property in Guaymas and other towns in Sinaloa, on the east shore of the Gulf of California. It is said that an earthquake in the Gulf made a tidal wave 20 feet high in the night; that the wave swept along the coast, carrying sailing craft inland and wrecking seventeen in Guaymas harbor; that the wave was followed by a five days' hurricane, with the greatest rainfall known in fifty years, and that not less than 300 lives were lost, while mining plants and other property suffered injury amounting to several millions of dollars.

**Canada's New Ministry**

R. L. Borden, the new Prime Minister of Canada, and his Ministers, with the exception of Mr. Burrill, took the oath of office October 10, in the presence of Earl Grey, at Government House, Ottawa. The Ministers and their portfolios are:

W. T. White, Finance; George E. Foster, Trade and Commerce; J. D. Reid, Customs; Frank Cochrane, Railways; T. W. Crothers, Labor; Col. Samuel Hughes, Militia; A. E. Kemp, G. H. Perley and Senator J. A. Lougheed, without portfolio; Hon. Charles J. Doherty, Justice; L. P. Pelletier, Postmaster-General; F. D. Monk, Public Works; W. B. Nantel, Inland Revenue; W. J. Roche, State; Martin Burrell, Agriculture; Robert Rodgers, Interior; J. D. Hazen, Marine and Fisheries.

Three days later the Duke of Connaught, Earl Grey's successor as Governor-General, arrived at Quebec. Addresses of welcome were presented on behalf of the Government of the Province of Quebec, and to these the Duke replied fluently in French. Next day the Duke and Duchess reached Ottawa, where they were received with much less enthusiasm than the appearance of the former Premier, Sir Wilfrid Laurier, evoked.——The Government's decision to hold ministerial by-elections November 1 caused embarrassment, as this is All Saints' Day, a legal holiday in the Province of Quebec, where five of the Ministers seek election. The date was subsequently postponed. The Liberals threaten to contest several by-elections, which would delay the meeting of Parliament until later than November 15.

**The Occupation of Tripoli**

The landing of the Italian troops at the city of Tripoli and other points to the eastward was successfully accomplished during the week. The Tripolitan coast has been notorious from the dawn of history for its perils to navigation, and even at the present time steamers have been kept by storms from calling at Tripoli for a week at a stretch. But fair weather favored the Italians, and no attack was attempted by Turkish vessels on the transports in their passage across the Mediterranean. The first contingent of the army of occupation sailed from Naples on the night of October 5 and captured Tobruk on the 10th after a brief bombardment by four battleships. The departure of this fleet and its destination had been kept absolutely secret from the newspaper correspondents until its aim had been accomplished. Tobruk is the port nearest the Egyptian frontier, and it is rumored that Italy's sudden action against Turkey was instigated by learning that Germany had designs on Tobruk for the purpose of establishing a center which would command the Mediterranean trade routes. The main part of the army of occupation was composed of three contingents, sailing respectively from Naples, Taranto and Agosta, and assembling east of Malta. The sixty steamers, carrying the men, horses, munitions and supplies, were convoyed by battleships and cruisers, in two lines, a mile apart and five miles long, and further protected on all sides by the smaller vessels of the navy. The fleet traveled slowly and without lights at night. Naval attachés of the European Powers and of Japan, China and the United States accompanied the expedition. A novel addition to the military equipment was eleven aeroplanes and two dirigible balloons. These may be used for fighting as well as reconnoitering, since they are provided with bombs for dropping on the enemy. The troops, as they were rafted to land, were received with great enthusiasm by the Italian officers and garrisons, and the inhabitants of Tripoli seemed almost as well pleased, for thousands of rations were distributed to the destitute and all who wanted it could find employment as porters or in providing for the accommodation of the soldiers. A large part of the entire army of occupation, estimated at 40,000, is now safe in Tripoli. The chief danger is from cholera, which has broken out in Tripoli and caused fifteen deaths in the first two days.——The Turkish garrison, numbering two or three thousand, under Munir Pasha, retired about twelve hours' inland upon the capture of the city, with most of their movable artillery, amounting to some thirty pieces. This, however, was soon abandoned and the camel drivers deserted the Turks and returned to the city with their trains. Before the evacuation 30,000 modern Mauser rifles were given away to the Arabs. The Turks are said to be encamped among the hills of the desert suffering for lack of food, cut off altogether from communication with Constantinople and both indisposed and unable to offer any serious resistance to the invading army. A small party made a night attack in the attempt to capture the Boumeliana springs near Tripoli and so cut off the water supply of the city, but it was repulsed by Italian outposts at that point after half an hour's fighting with the aid of the warships in the harbor, which, under orders by wireless, sent six and twelve inch shells over the city and among the Turkish troops.——There has been no fighting in Europe during the week and in all probability hostilities will be confined to Africa. An armistice is expected, if indeed it is not already in effect. The Italian Government has announced that the time has gone by when it would consent to assume a protectorate over Tripoli. Having now gone to the expense of occupation it will accept nothing short of annexation. The threat to expel all Italians from the Ottoman Empire has not yet been carried out, and the apprehended massacres of Italians have not taken place anywhere, with the possible exception of Kenak, Syria, where, it is said, thirty Italian laborers employed on the Hedjaz railroad were killed. The Turkish Parliament assembled on October 14 and was addrest by Sultan Mohammed V, who denounced the action of Italy in firing on Turkish torpedo boats before the twenty-four-hour ultimatum

had expired. Russia has warned Turkey against interference with grain ships from the Black Sea, even when bound for Italian ports, since, according to the Declaration of London, food is not contraband of war unless it is destined for the use of troops.

**Rebellion in China**

An insurrection which broke out in Wu-chang on October 10 seems likely to prove the most serious attempt to overthrow the Manchu dynasty that has been made since the Tai-ping rebellion. The Viceroy of the Province of Hu-peh discovered the existence of the conspiracy on Monday and at once sent out troops to raid the headquarters. Thirty-two arrests were made and four of the prisoners were beheaded next morning in the street in front of the Viceroy's yamen. This action precipitated the insurrection instead of checking it, and before night the Viceroy had fled from the city and taken refuge on a yacht in the Yang-tse. Mobs of Chinese took possession of the streets, starting fires in all quarters and killing Manchus at sight. Eight hundred Manchus were slain the first day. The imperial troops mutinied, burned their barracks and killed their commander with a dynamite bomb. These soldiers, numbering 15,000, supplemented by some 10,000 volunteers who were armed from the arsenal at Han-yang, form the nucleus of the movement, which appears to be admirably organized and controlled. A provisional government was at once established, composed chiefly of members of the provincial assembly, with Tang Hua-lung, retiring president of the Assembly, as Governor of Hu-peh, and Li Yuan-heng as commander-in-chief of the rebel forces. Sun Yu, who was elected president of the Assembly, is a brother of Sun Yat-sen, well known in the country as a revolutionist. Dr. Sun is a republican and a Christian, educated in Honolulu, where his father was a wealthy merchant. Implicated in a conspiracy against the Manchu dynasty in 1896 at Canton, he escaped to America, with a price on his head. When the Empress Dowager, on her seventieth birthday, issued a proclamation of general amnesty, he was specifically exempted from it. In 1895 he was kidnapped in London and imprisoned in the Chinese Embassy there, but he managed to get a letter to Lord Curzon, Under Secretary of State, and Lord Salisbury secured his release, since he claimed to be a British subject. Within the past few months he approached financiers in London and New York to negotiate a loan of $2,500,000 to start the revolutionary movement, which he asserted had the backing of men worth $20,000,000. Dr. Sun is said to be now at the headquarters of the Young China party in Chicago. The rebels are well supplied with funds, as they are issuing paper money to replace the Government notes which are refused by the banks. The new currency is supported by the silver bullion, amounting to several million dollars, captured in the Government mint. A proclamation by the insurgent leader, Tang, announces as the objects of the movement the expulsion of the Manchus, the establishment of a republic and the construction of internal improvements by native capital. The land will be nationalized and the suffrage extended to all literate men and women. He declares that there will be no hostility to foreigners so long as they do not take sides with the Manchu Government. So far the insurgents have scrupulously abstained from any injury to foreign residents. The ten naval vesesls now in the river—four British, two American, two German and two Japanese—will afford ample protection to the missionaries and other foreigners in case the rebel leaders should be unable to control their followers. The three cities of Wu-chang, Han-kow and Hang-yang are all in the hands of the insurgents, and their power is said to be extending over the provinces of Hu-peh, Hu-nan and Ho-nan. The southern part of the Peking-Hankow railroad and the telegraph lines are under their control. The arsenal at Hanyang, working double shifts, is turning out 25,000 rounds of ammunition a day. The Government has called upon Yuan Shi-kai to take command and put down the rebellion. Yuan is a Chinese who, as Viceroy of Pe-chi-li Province, organized the first efficient army on modern lines that China has ever had, but his success and his progressive views

aroused the displeasure of the Manchu princes and he has been in retirement for over three years.——It is admitted that the insurrection in the Province of Szechuan has not been quelled by the Government troops, but what is its present extent and what connection it has with this new rising is not known.

YUAN SHI KAI REVIEWING HIS TROOPS

The Chinese Government has recalled him from his enforced retirement and made him viceroy of the disaffected provinces. He is expected to lead against the rebels the army which he, when Viceroy of Pechili, organized and drilled on the western manner. In the photograph Yuan is standing beside the Minister of War, Yu Lung and has just turned around. On the left is the Dragon Banner of the Imperial Government under which the insurgents have now raised their blue flag with the twelve-rayed sun

# The NASSAU BOULEVARD AVIATION MEET

by

## AUGUSTUS POST

THE recent "Flying Tournament," as it was called, which was held on the aviation grounds of the Aero Club of America and the Aero Club of New York, fully accomplished its purpose, which was to demonstrate practically the various uses to which an aeroplane could be put, and also to show the reliability and speed possibilities of the latest forms of machines made in America and in Europe.

Not the least among the features that were novel and that marked a decided step in advance was the fact that for the first time in this country women aviators entered into competition at a meet and flew for prizes. The Postmaster-General of the United States, Mr. Frank H. Hitchcock, descended, or to be more accurate, ascended to the level of an aerial mail-carrier and personally delivered a sack of United States mail by air route from the post office established upon the flying field to a station at Mineola, piloted by Captain Paul W. Beck, U. S. A., and accompanied by Earl Ovington in a second machine, also carrying a mail pouch. Besides appointing Mr. Ovington its first official aerial postman, the United States Government was represented by Captain Paul W. Beck and Lieutenants Henry H. Arnold and T. D. Milling, of the army, and Lieutenant T. E. Ellyson, of the navy, who hotly contested all the biplane events with their Curtiss and Burgess-Wright machines.

As usual in speed events, the French monoplanes, driven by T. O. M. Sopwith and Claude Grahame-White, outclassed the American biplanes, with the single exception of Mr. Ely's Curtiss, which was equipt with a high-powered engine and was only a fraction of a second slower than Mr. Sopwith's Bleriot.

Grahame-White's "Nieuport," which resembles a fish more than a bird, is the latest type of racing monoplane, and is capable of making a speed of about 75 miles an hour. It is the same type of machine which was used by Mr. Henry Weyman when he won the Gordon Bennett Aviation Cup for America last July. This particular machine is perhaps the most interesting of all the aeroplanes that were flying in this meet, for it represents

the greatest refinement yet attained both in details of design and in manner of construction. The graceful lines of its body and wings conform to the theoretical stream lines of the air, and offer the least resistance possible, and the entire body is covered, so that the wires and braces will not be exposed.

When flying this machine is as steady as a locomotive upon steel rails. There is no perceptible unevenness in flight, even in a high wind, such as is quite evident in the flight of slower and smaller machines. Mr. Grahame-White, besides his "Nieuport" monoplane, flew a small biplane known as the "Grahame-White Baby," a speedy little machine very much like a small Farman, over which he showed a marvelous control, flitting about like a swallow when not in competition and cutting figure eights and aerial capers only possible to such a master of the art of flying. His nearest rival in speed and cross-country flying was Mr. Sopwith with his Bleriot, who had also a Burgess-Wright machine equipt with a Gnome, or revolving cylinder air-cooled motor, instead of the regulation Wright motor. He also had this machine fitted with a Farman system of control, which consists of a single lever, movable in all directions, for steering up and down and balancing, and a cross piece for the feet to operate the vertical rudder, in place of the regular two-lever system used by the Wright brothers in their standard machines. With this machine he was able to carry passengers, and succeeded in attaining such proficiency in throwing make-believe bombs

MADEMOISELLE DUTRIEU AND HER BIPLANE

at a target on the ground that his accuracy repeatedly won for him in this event.

Mlle. Hélène Dutrieu, the representative aviatrice of France, brought with her a specially built Farman machine of the very latest type and exceedingly light construction, for Mlle. Dutrieu herself is of very slight build and weighs only 98 pounds. Mlle. Dutrieu holds the "Coupe Femina" awarded for the longest flight made last year by a woman, in which event she made 103¾ miles in two hours and thirty-five minutes. She won the Yves de Villars Prize, which was offered at this meet to the woman pilot who made the longest flight, and by remaining in the air one hour, five minutes and fifty seconds she won this prize and established a new American duration record for women pilots.

This meet has served to emphasize the growing distinction between the two classes of machines, monoplanes and biplanes, which seem to be particularly adapted on the one hand to speed and on the other to maneuvring, passenger carrying and general all-around flying.

Among the most interesting of the events that occurred during the meet, and one that won the most popular applause, was the new game, "Aerial Polo." This event, officially known as

"Communication from land to air forces," was suggested by Harry Atwood, the famous cross-country flier. Small toy balloons were liberated, each one having a message tied to the end of its string, which was to be caught by the aeroplane pilot or a passenger carried with him, opened, read and acted upon. It was very funny to see the antics of the aviators as they swooped down upon these innocent balloons like great vultures, sometimes completely missing them and blowing them far away by the rush of air, requiring a long chase until finally captured. The messages contained instructions to land at a designated spot, and the pilot doing this in the shortest period of time was the winner.

Troops concealed on the ground two miles from the flying ground were discovered by aerial scouts, and a rifle match was held between Lieutenant Fickel, U. S. A., and Captain Patrick Hamilton, of the English army, each shooting from an aeroplane at a target placed upon the ground below. In fact, all the uses that could be thought of, to which an aeroplane could be put, were tried; a relay race was held in which a dispatch was carried by one aviator and then passed on to his waiting partner, as in the days of the old "Pony Express"; a passenger-changing race and a mail carrying race furnished good sport for the spectators. A mail-delivery race, in which five aviators carried United States mail across country and brought back other packets on their return, was a further practical demonstration of the future's possibilities. One world's record was broken by Lieutenant T. D. Milling, who flew for 1 hour, 54 minutes, 42⅘ seconds, carrying three passengers. This is noteworthy for the fact that if, instead of the weight of the passengers, gasolene had been carried, the aeroplane could have had fuel enough for a 500 mile trip.

During the entire week of the meet, when there were sixteen men flying in competition nearly all the time and upon one occasion eight machines in the air at once, when there were over 150 hours of flying and 1,000 miles were flown, in most cases with a passenger, it is particularly notable that not a single accident of any nature whatever occurred to any of those regularly entered, altho three were women, and that the only serious accident that did occur should have happened to one aviator who was not flying in competition.

Over twenty thousand dollars in prizes were won, and a dozen new American records established, besides many practical results which will serve to benefit aviation and aeroplane construction in America. With the growth of the sport of aviation, and as flying meets clearly emerge from the simple tho hazardous exhibition and pass into a higher state of organized and controlled competition for prizes, instead of haphazard flying wherever the whim of the aviator may take him, a new element enters, and this organization and control will be a great power in the future to develop both the aviator and the machine to a state of practical perfection, just as contests and races have been in the past for the automobile industry. When the pilot has a definite object in view or a task to perform his mind is occupied and focused upon the end, and he will think the problem completely thru to its finish. Hesitation, wavering, change of decision is more serious in the air than anywhere else, and the well-known adage, "He who hesitates is lost," applies nowhere more truly than to aerial navigation, for the quickness of the wind almost exceeds the speed of thought, and Nature never stands still. These tests, properly observed, give accurate data upon which to build, strong and weak points are brought out clearly, and may be quickly remedied.

An organization to run the sporting side of a meet is quite as elaborate as that required to manage spectators and financial matters. A committee has to provide rules, programs, new events, instruments, experts in timing and measuring and systems of communication, and to see that all the pylons are properly manned by observers, who note if any of the machines fly inside of the imaginary lines which they mark. Aides to each aviator are also provided, who act as attorneys to interpret the rules and conditions, make official entry for events and see that all formalities are carried out, leaving the aviator free to attend to

the details of his machine. Protests are entered and decisions are made with due regard for precedents and decisions in other cases, and the "code of the air" is rigidly maintained. The "code of the air" provides that you must not pass nearer than 75 feet on the same level, and if passing over or under another machine the distance must exceed 150 feet, in addition to the regular racing rules referring to fouling, crowding on the turns, and similar practices.

Matters have been developed to such an extent that aeronautics and aviation are practically upon a universal basis. There is but one power, the Féderation Aeronautique International, commonly known as the F. A. I. National lines are only geographical. Records, machines, pilots and organizations are so inseparably interwoven that they form one great body making for universal peace and mutual understanding, for if you have one bond of union and sympathy, others more easily follow.

The Aero Club of America was organized to bring together men of ideas and to enable them to exchange these, to avoid repetitions and mistakes, to profit by mutual co-operation, and to bring the subject clearly before the public in its right light. It was eminently successful in this undertaking, and also in making America foremost in the rank of nations in aeronautics and aviation. We propose to continue in this position, and to bring the industry and the practical, material result of our thought also into line with the foremost achievements and to organize and control action to this end, just as was done during the period of education just passed. Experiments and exhibitions have gone, contests are here; the great race is on, and may America win.

New York City.

# Ex Oriente Lux

BY KATHARINE LEE BATES

Brown were the feet,
Burned by the Syrian heat,
That wistful Mary with the nard anointed
Till all the house was sweet;
Such feet as yet
Beside the Sea of Galilee are met,
On those sad shores whence rises, heavenward pointed,
Only the minaret.

Those hands were brown
That wrought in Nazareth town,
As brown hands there today the white walls fashion:
Hands that drew down
—O pierced hands!—
Blessing for far-off, undiscovered lands.
Within the shelter of their wide compassion
The pale-faced Gentile stands.

Out of the East
The Light came and increased
Upon the skies till our dim west was litten.
Guests at the feast,
Our pride of race,
Smiteth a holy face,
That young, dark face by Roman soldiers smitten.
Christ mend us of His grace!

# The Turco-Italian Conflict

BY SYDNEY BROOKS

ALL Europe is in a nervous tremor. From St. Petersburg to London the atmosphere is clouded with apprehensions and a sharp sense of insecurity—apprehensions such as Americans must find it difficult to realize and a sense of insecurity that never disturbs their remote tranquillity. It is, indeed, precisely at such times as this when the armed camps of Europe are bustling with preparations, when it rests with perhaps half a dozen men to say whether an essentially trumpery conflict is or is not to develop into a vast conflagration, and when all men are abruptly made to recognize that national safety, national existence even, depends today, as much as it ever did, upon sheer brute force—it is at such times that one appreciates the uniqueness of America's position, the happy chance and the sound policy that have spared her the burden of militarism, and her admirable good fortune in being exempt from the panics, animosities and perils that convulse the older world. It is a good fortune purchased, of course, at a price, and America no doubt loses something, even if she gains much, by standing above and apart from the elements of international strife and by finding a law of nature virtually suspended in her favor. But I do not suppose that any American would consider the disadvantages of the situation to be other than enormously outweighed by its advantages, or would have been willing for a single moment to have his country change places during the past few weeks with any of the great Powers of Europe. Lord Salisbury used to say that, while most of the obvious causes of international conflict could be foreseen and guarded against in advance, the real peril to European peace—the thing that would probably precipitate Armageddon—lay in some small unnoticed issue that diplomacy had scarcely troubled itself with, that would spring upon the world suddenly, and spread and spread until it had ranged all the leading Powers on one side or the other. What Europe is wondering today is whether the Turco-Italian clash over Tripoli is the sort of issue that Lord Salisbury had in his mind.

Certainly it appeared on the stage of international affairs with all the requisite suddenness, with a suddenness, indeed, that was almost brutal. A week before war was actually declared only a handful of people in Europe had any idea of what was impending. The average man was just beginning to gather from his papers that some dispute—precisely what he could not make out—had broken out between Turkey and Italy in regard to Tripoli, when he found that the dispute had developed into active hostilities. It was not on Rome that European opinion had been concentrated, but on Berlin; not on Tripoli, but on Morocco. After months of slow anxiety the negotiations between Germany and France were at last known to have taken a favorable turn and to be nearing their end. Every one was eager to learn what sort of a settlement had been patched up; every one was beginning to breathe a little more freely and to congratulate himself on the passage of one more crisis; when, in almost the twinkling of an eye, all was changed, the scene was shifted from Morocco to Tripoli, France and Germany and their respective rights and wrongs were forgotten, and Europe found itself confronted with the amazing, the utterly unlooked-for, development of a war between Italy and Turkey. It is not, it is true, in itself a very serious war. Italy having no intention of invading Turkey, and the Turks having no navy wherewith to oppose the Italian occupation of Tripoli, neither combatant can get at the other, or wishes to get at the other, with any effect. It is a struggle between wolf and whale; it is what Lord Halsbury in the latter days of the conflict with the Boers immortally described as a "sort of" war. The specific object, moreover, to which it is directed

the supersession of Turkey by Italy as the ruling power in the Tripolitaine is not one that involves any vital changes in the balance of power or that affects the political or economic interests of other nations to any considerable degree. None the less the Turco-Italian war is of grave importance. It is important as an object lesson in the kind of political morality that obtains in twentieth century Europe. It is still more important by reason of its possible reactions and of the dire consequences that may flow from it.

Italy's action in the matter has aroused universal disquietude and been pretty roundly condemned from one end of Europe to the other, and not least by the public opinion of Italy's own allies. At the same time there is little disposition to question the reality of Italian grievances in Tripoli. That Italy politically, geographically and economically has a superior interest in the Tripolitaine to that of any other European Power; that the Turks, and the Young Turks especially, have persistently and systematically thwarted Italian enterprises; and that Italian protests have been treated with contemptuous evasions—all this is admitted even by those who are most strongly opposed to the extreme course adopted by the Italian Government. If one were to take the official list of Italian complaints seriatim, one would doubtless find that here and there there had been some exaggeration, and that this point or that was susceptible of explanation. But on the whole the legitimacy of the Italian case against Turkey is acknowledged. All those exasperating devices which the Turks know so well how to employ have undoubtedly been used in Tripoli to humiliate the Italians and to keep their commercial undertakings confined to the narrowest limits. It may of course be replied that this was the only policy open to the Turks under all the circumstances; that for thirty years or more Italy has openly proclaimed her reversionary expectations to the ownership of Tripoli; and that to facilitate her designs by allowing Italians to buy land, by alloting them profitable contracts and by encouraging their financial and commercial control of the country would have been, on the part of the Turks, little less than a quixotic form of treason. But to this the obvious answer is that, such being the conditions, the true policy for the Turks to pursue was that of effecting an arrangement under which free scope would have been given for the development of Italy's economic interests in return for an explicit acknowledgment of the sovereignty of the Porte. That Italy until very lately had no intention of occupying the Tripolitaine by force, and that she would gladly have assented to some such arrangement as I have outlined, may be taken for certain. If a solution on those lines is now impossible the Turks, and they alone, are to blame for it. They have met all Italian representations with provocative indifference or wilful obstruction, and they are now paying the penalty for their myopic folly.

It is a very significant fact that the Italian people are standing shoulder to shoulder behind their Government in approving and supporting the expedition against Tripoli. The fact is significant, first, because anything approaching unanimity on any question of Italian policy is almost a new experience in the Peninsula; secondly, because the Italians are not an aggressive people; and, thirdly, because ever since the disaster of Adowa they have shown a marked disinclination for further adventures. Moreover, the Italians are an economical nation, and even a naval war with Turkey costs money and deranges the already delicate scheme of national finance. They cannot, again, hope to win from the expedition any material equivalent that will compensate them for its risks and expense. The Tripolitaine some 2,000 years ago was highly cultivated and supported a large population, and with prodigious exertions and a free resort to dry farming, it might, in spite of its lack of rivers and scarcity of wells and springs, again be made a land of thriving agriculture. But the prospect, like the possibility of mineral wealth, is too problematical to tempt a sane and calculating people like the Italians into a war of conquest. The organizers of the Jewish colonization scheme examined the hinterland of Tripoli not long ago and turned from it in dismay; there is little chance that it will ever serve to deflect

the stream of Italian emigration from the Argentine and the United States; and its commercial future, now that the Trans-Saharan caravan trade has been largely captured by the Niger and the Benue and threatens to disappear altogether when the Lagos-Kano Railroad is opened, can hardly be said to be bright. Furthermore, the Italians know better than any one can tell them that there is all the difference in the world between capturing Tripoli and establishing an effective control over its roadless, waterless, sand-swept hinterland, where the Arabs, and especially the Senussi, have never shown anything but abhorrence of the thought of Christian rulership. They must also be as fully aware as any of their critics of how much they have risked by their drastic handling of the Tripoli question. They have jeopardized their place in the Triple Alliance, they have brought the Balkans within measurable distance of a terrific explosion, they have exposed Albania, where their interests are and must always be of far greater moment than any conceivable stake they can ever possess in Tripoli, to the possibility of Austrian intervention, they have dealt the Young Turk régime, with which they have always professed and felt an instinctive sympathy, a staggering blow, and they have forfeited, for the time being at any rate, the friendly regard of Great Britain.

In the face of all this, when every consideration of prudence, equity and self-interest seemed to counsel moderation, why, it may be asked, did the Italian Government decide upon war, and why have the Italian people backed it up with such spontaneous unanimity in its fateful choice? The answer is that step by step Turkish dilatoriness and bad faith have worn out the patience of the people, the press and the Government; that it has been borne in upon Italians that the Turks would treat no other Power as they have treated Italy; and that to submit longer to a studied policy of insults and contumely was to throw honor overboard and acknowledge a craven inferiority. The Turkish conduct of the whole question of the Tripolitaine has been such as to flick Italian *amour propre* on the raw and to convince the people of the Peninsula that they owed it to their own dignity to assert themselves with decisive vigor. The average Italian is under no illusion as to the profit, either political or commercial, that is to be had from occupying Tripoli. He is not seeking profit; he is seeking to rehabilitate himself not so much in the opinion of Europe as in his own eyes; he is seeking to safeguard that national honor which further inaction or forbearance would have compromised, as he believes, beyond redemption. That is the spirit which has produced and accounts for the miracle of Italian solidarity; that is why the Socialists and the anti-militarists have been swept away by the full tide of national patriotism; that is why all other considerations have seemed irrelevant compared with the necessity of recovering the national esteem. That the ministers, statesmen and officers have shared this popular impulse cannot be doubted. That mingling with it there has also been the reflection that Italy by her own shortsightedness had thrown away repeated chances of becoming a North African Power; that Tripoli was the one opening left to her; that it, too, might be closed if, with the settlement of the Morocco question, France began to expand southward and eastward from Tunis, and if Turkey took to strengthening her fleet, and that the hour had therefore struck for risking everything on a single throw—that these calculations helped to fix the purpose of the Consulta and to nerve its action is very probable. But the general operative temper of Italy as a whole thruout this business is that of a nation reluctantly taking up arms to save its self-respect and grimly resolved not to lay them down until the humiliations of the past are made for ever impossible of repetition.

It is probable that neither Europe nor America has quite understood that this, and no other, is the spirit in which Italy has engaged in her amazing adventure. If they had understood it they might not have sympathized with her proceedings any the more, but they would at least have realized that no mere documentary schedule of grievances and complaints can convey the real inwardness of the Italian case. As it is, in Europe at any rate, the well-nigh universal disposition

has been to compare Italy's published statements of her wrongs with the extreme measures she has adopted for redressing them and to conclude at once that the former were no justification for the latter. No statesman and no journal, so far as I am aware, has ventured to assert that Italy's case against Turkey warranted the delivery of an ultimatum, followed within twenty-four hours by acts of war. The moderation of the Turks in the face of the unexampled situation which was forced upon them, the restrained and negotiable spirit in which they replied to the ultimatum, and their repeated appeals to Europe to prevent hostilities, have certainly thrown into high and displeasing relief the brusqueness of the Italian procedure. Twenty and even fifteen years ago such action as the Italians have taken would have seemed to the world such a profound violation of the accepted code of international morality that a concert of the Powers would have sprung into existence almost automatically to prevent it. But the conscience of nations has been blunted by the idolatry of force; "the public law of Europe" is a phrase that, ever since the annexation of Bosnia and Herzegovina, has lost its old and vital significance; the new doctrine of "compensation" which Germany has exploited so adroitly in Morocco is little but "the good old rule, the simple plan" under a high-sounding name; international politics have drifted from their legal moorings and now resemble nothing so much as a series of floating mines. So that while Italy's policy has been roundly reprobated as the most barefaced—at any rate since Germany's seizure of Kiao-chow—example of the rule of might that we have seen in modern times, there has not been, nor will there be, any effective intervention to stay its course.

Europe meanwhile awaits developments with anxious trepidation. There is no Power that does not feel in its own sphere of interests the reflex action of Italy's escapade. Great Britain with 100,000,000 Mohammedans under her sway is gravely embarrassed when a Power to which she is bound by innumerable ties of political and sentimental interest commit a seemingly unprovoked attack on the head of the Mohammedan faith and initiates a campaign of conquest against a Mohammedan country. Germany is driven well-nigh to distraction at having to choose between her Turkish friend and her Italian ally. Austria-Hungary watches with ill-concealed anxiety and disfavor, tho not without a hope of ultimate profit, the repercussion of Italy's adventure on the tumultuous politics of the Balkans. France foresees that the prolonged negotiations with Germany over Morocco, just when they were nearing a satisfactory settlement, may be completely thrown out of gear if other States take fire from Italy's example. The Young Turks find all their difficulties—already so great as to be almost overwhelming—intensified ten times over. What is to prevent them, asks one foreign office after another, from adopting the principle of "compensation" themselves and recouping in Thessaly the losses they are destined to undergo in Tripoli? And tho Italy has undertaken not to attack Turkey in Europe and to discourage every insurrectionary movement in the Near East, how can she, engaged as she is, restrain the ambitions of the Balkan States or prevent the conflagration from spreading? If the Turks follow up their threat to boycott all Italian goods and expel all Italian residents, is it even certain that the war begun in North Africa will not be transferred to the Near East? What of Albania and Montenegro, of Macedonia and Servia, of Greece and Bulgaria, of the Young Turk régime itself? Is it to be supposed that the violent dismemberment of the Ottoman Empire in North Africa will have no effect on these explosive interests? London, Berlin, Vienna, St. Petersburg and Paris are all asking these questions and many others, but without receiving a comforting answer to any one of them. The more need, therefore, that they should get together while there is yet time and devise a diplomatic formula that will save Turkey's face and give Italy what she wants.

LONDON, ENGLAND.

# In Darkest Connecticut

BY POULTNEY BIGELOW

CONNECTICUT is a purified Massachusetts, or at least was deemed so in that fortunate period of our history before the poison of Protectionism had sapped away the conditions which made life on the soil profitable in New England. No one of our States surpasses Connecticut in rural charm. It is a land well wooded and watered; admirably diversified by mountain and plain; a seaboard with many harbors and a climate where tobacco flourishes side by side with the pine.

Fifty years ago this whole beautiful State was dotted with the homes of well-to-do and public-spirited citizens, descendants of that sturdy band of settlers who in 1636 established broader principles of civil and religious liberty than were tolerated amidst the Puritans of Plymouth Rock.

These reflections come to me at the close of a driving trip with my wife and two Morgan horses—a trip which covered about five hundred miles of lovely scenery between the upper Hudson and the Thames. It is a form of holiday which I cordially commend to my friends—unless they are able to go afoot—which, of course, is the ideal method of studying political conditions at first hand. As to motor cars, they should be classed with locomotives and limited to special roadways maintained for their exclusive perambulation and—perfumery.

If we as a nation decide that the horse is to be exterminated from the farm, then is our present road-building policy a wise one; but motor cars are no more likely to abolish horses than steamboats to suppress sails. Is it not time that our central government in Washington should take charge of our great land highways thruout the country? Our waterways are already in the hands of Government—why not our land ways? No one who knows the West Point graduate doubts that we would get better highways from our army engineer corps than from the ten thousand political bosses who today get rich from dishonest road making.

We did our best to dodge the State roads of Connecticut, for in most cases they are hard as city pavements. They rejoice the soul of the benzine burner, but they are torment to the feet of my pattering nags, who would rather do fifty miles a day on the old-fashioned country road than a third of that distance on asphalt.

Thruout Europe the road-making authorities show regard not merely for the motor and the heavy cart but also for the horse under saddle or in light harness—and above all for the traveler on foot. As compared to Europe it is rare on New England roads to see people walking for recreation—even in my own beautiful Catskills a pedestrian is a curiosity—and no doubt the condition of our roads is a partial explanation.

In Germany and France we often note very hard macadam at the crown of the road, but at the sides a good dirt road or even bridle path, and also a well-kept footpath. The contractors or politicians who have had the making of our latter-day roads have apparently concluded

that those who are too poor to afford an automobile are too feeble to exert political pressure against them.

What has become of the many beautiful homes that were sprinkled up and down Connecticut a short half century ago? Let us drive up thru the weedy roadway of some venerable mansion whose architecture and massive stone steps suggest dignified pedigree. We look in vain for the prosperity promised by the apostles of Protectionism. On all sides the eye of a farmer sees evidence that those who live here are people of yesterday who may be gone tomorrow and whose interest lies in pillaging the place of whatever can be sold for cash. Nor are we disappointed when we discover that the inmates are a colony of Galician Jews whose passage has been paid by some philanthropic Hebrew society in London. These Jews have never yet loved labor on any soil nor are they apt to develop their first agricultural ambition in Connecticut. But they gladly camp upon abandoned farms until such time as they have secured capital and experience enough to go out upon the road as itinerant merchants. The overwhelming majority of those we saw by the roadside were Italians—the noble race of Garibaldi and Christopher Columbus—industrious, prolific, and excellent material for future citizenship. They cannot yet speak English, nor can the hundreds of Slavonians, Hungarians, Bohemians, Poles, Roumanians, Syrians and Bulgarians who seem to stand sentry at every cross-road where we yearned for someone of English speech from whom we might extract information.

The Americans have disappeared, like the red man. We only guess at their whereabouts. The census gives us but partial information, and the bulletins from Washington publish the triumphs of Protectionism and not the disasters to American farmers in New England. To find the children of those whose homes represent the ruins of modern Connecticut, follow me into the slums of New York, Boston or Chicago, or into the hundreds of equally unsavory factory towns that blot the landscape of this otherwise beautiful State. Here are the altars reared by the priests of Protectionism and here are the human sacrifices; hundreds and thousands of girls and boys drawn away from the healthy outdoor life of the farm, lured by the precarious wages offered by big stores and factories. Side by side with the contents of the last emigrant ship you will find grandchildren of once notable New England landowners earning a mere subsistence and wondering why farming no longer pays in their native State. The great army of typewriters, stenographers, school-teachers, shop-girls—the dependent class of daintily-reared, well-educated but empty-handed children of American ancestry—these seldom revisit the old Connecticut homesteads, for they are too proud to let their tears be seen by the present possessors.

On all sides thruout Connecticut the same lament is heard from those who still doggedly seek to live upon the land of their fathers—the cost of living is so high—the cost of labor so prohibitive—the cost of transportation to market so exorbitant—each wonders how long he can stagger under his mortgage or when he shall have to abandon the farm and take day wages in a neighboring factory.

Am I unfair? Will Mr. Taft once more command a host of salaried "experts" to denounce me as a traitor to the sacred cause of High Tariff? Have I seen only darkest Connecticut? Am I blind to the tremendous progress this country has made since the Civil War, all of which is periodically printed in Washington and distributed at great expense?

And indeed Connecticut abounds in magnificent country seats; costly private schools where rich people send their children from every State west of the Mississippi. There are beautiful villages today—notably Sharon, Ridgefield, Farmington, Saybrook, Branford—I cannot enumerate them all. Those who have made fortunes thru the tariff and the trusts buy land and rear palaces and sing the praises of Protectionism, without whose aid they could not have dispossessed the former proprietors. The shore line of Connecticut is a marine esplanade of costly residences built by men from the big cities and the factories to whom the history of Connecticut is as strange as that of ancient Chaldea.

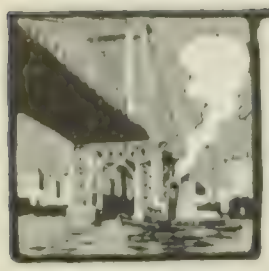
They know that they have grown rich and they know that the high Protective Tariff exists. It does not interest them to be told that while they have been growing rich New England farmers have been growing poor. The rich man has little difficulty in looking upon trusts and tariffs as divine institutions like a storm at sea or a drought in the valley of the Ganges. The idea of seeking to subvert the pillars of Protectionism seems to my plutocratic neighbor not merely unpatriotic but positively sacrilegious. My friend in his palace on the Connecticut thinks it quite right that the tariff should enrich a few manufacturers at the expense of millions who consume.

Personally I respect the Protectionist as I do any other American who lives to make money and succeeds; but politically I regard him with suspicion—even alarm, because Protectionism and her children, the trusts, have formed a combination by means of which the good things of this world are unfairly distributed; and when a nation of voters suspects that a privileged few are making inordinate profits out of those less fortunately situated then may we reasonably anticipate labor war.

My Connecticut drive is done; my nags are once more in the pasture; and my study table calls me. I have not singled out Connecticut with malice; on the contrary Connecticut was my home when at college and in the preparatory school, and there is hardly a village in that State that is not dear to me. Nor am I one of those Americans given to compare my country unfavorably with Europe when they themselves know nothing of America but New York. There are few of these United States in which I have not been; and the reflections which occurred to me during my recent driving trip might with equal justice have been noted down regarding almost any other of the original States that declared themselves in favor of free trade and free soil in 1776.

The study of Protectionism in Connecticut can but intensify one's natural aversion to injustice and special privilege. Free Trade seems to me as much a part of God's Law as Freedom of Thought or the duty to do as we would be done by. Free Trade tomorrow might hurt some of my Protectionist friends, but it would help millions of my fellow workers who have hitherto paid more than their fair share of the national taxes.

MALDEN-ON-HUDSON, N. Y.



# The Sea Mist

BY AMOS R. WELLS

It crept—crept—crept—
Into the rooms where people slept,
And breathed on the mirrors till they wept.
In hungry mood
It stole to the pantry crammed with food
And left the taste of its saltness there.
It sat in my chair
And moulded the leather. It filled the air
With a great gray ghostly horror that was not light
Nor dark, but a pall and a blight.
It crawled thru the trees,
And changed the woods into islanded seas.
It prowled, prowled, prowled.
And all that it touched it fouled.
It was not the sea,
My splendid, brave, and glittering sea,
But it held the ocean as it held me,
And hushed its waves with its mystery.

It was not the sea, for out of the sea there came,
With a cheery burst of jubilant flame,
My comrade the sun that put it to shame,
And thrust it away
With its trailings gray,
And its shattered horror that had to obey,
When, lo, a crystalline day!
But still, in the midst of the warmth and glow,
The clearness and fairness I know, I know
That out somewhere, beneath the horizon's rim,
Lurks the specter grim,
And soon, if I turn to sleep,
It will creep, creep, creep—
With its empty, mysterious dole
Back into the world and back into my soul.

# Profit Sharing

BY N. O. NELSON

[In our issue of September 23, 1911, we printed an article by Mr. Nelson, who is the head of the great profit sharing N. O. Nelson Manufacturing Company, of St. Louis, Mo., entitled "Co-operation." This second article is a logical sequel. In a personal note to the editor Mr. Nelson tells of establishing a co-operative creamery in Georgia, four milk shipping [illegible] by Dunlop and many other profit-sharing companies.—Editor.]

PROFIT sharing is in the air, and in this country unfortunately too much in the air and too little on solid ground. It has the approval of nearly everybody except the labor unions and the employers. The unions oppose it as tending to make peace and satisfy the workers; employers oppose it as a partnership of irresponsible men. The opposition is due entirely to ignorance. There are thousands of employers, banks, manufacturers and railroads, in this country who, in a perfectly well-meaning spirit, pay or give something besides wages to some portion of their employees. They call it profit sharing for want of a better name. Profit sharing has a well-defined meaning. The plans vary from Christmas gifts of turkeys or money to sales of stock on easy terms or pensions. None of these is profit sharing as implied in the composite word or as used in the books and the standard cases of practice.

Profit means the net gain after all expenses are paid, including interest on the money, which in this going world is worth its wages, and depreciation of property. Sharing means on equal terms to all. The essential conditions of profit sharing is that its terms be announced in advance, leaving nothing to the employer's caprice at the end; that it apply to all permanent employees of all classes; that it be rated on the wages of each man, his wages being the measure of his value or contribution; that it be paid in manner of distribution customary with the employer concern, whether as stock to increase the capital or in cash. It must recognize two reasons for its being: that it is fair to let every one who performs a share in producing the profit have a proportionate share of it, that men who have a share in the outcome will use more care and do more effective work and thus contribute more or less of the share they get. Not many employers will grant the truth of these claims, but only those who do will adopt any legitimate or valuable plan of profit sharing.

There is no lack of high authorities for this amended form of capitalistic business, for Mr. Roosevelt recommended it in a message, and Mr. Carnegie approved it many years ago and said in his recent book that to this equitable partnership between capital and labor we must come at last.

Profit sharing has a clear moral basis and a still clearer economic or business basis. No man's duty is ended when he has done what he is paid for. He is still a citizen, neighbor, friend. He scorns the imputation that money is the price of his manhood. By the same logic his work is not fully paid for in his wages. The full value of a man's work cannot be told in advance, the product may bring more or less; the expenses and losses depend on many circumstances. An employer could not safely pay as wages all the expected net proceeds. He must await the periodical inventory to learn the profit or loss. When he has paid the customary wages and paid the other charges and wiped out variable risks he can then award to each employee his share of the surplus, if any, in proportion to his wages, his relative value.

On the economic side it is assumed that most men will use more care and

waste less time and material when their own income is at stake, even in a remote and minor degree. Free labor is more effective than slave labor; the profit-sharing employer is working for himself and his associates; the wage earner is working for his stipulated dollar and by the clock or the union rule of limited production. It is not certain that every employee produces his own extra pay, but it is not merely imaginary that an entire profit-sharing force produces its part of the profit.

It is fair and it pays. It unites capital, ability and labor. The particular proportion of the profit that labor shall get, the division between capital and wages is elastic; it will depend much on the condition of the business, the motive and disposition of the owner and the attitude of the employees. Usually if not given up in a year or two the share of labor is increased; in some notable cases it has resulted in true co-operation, the employees paying off the original capital and becoming the owners and managers.

Commonly the start is made by allowing an equal rate of dividend on wages and capital—the same on $1,000 of wages as on $1,000 of stock; all charges, including interest on borrowed money and the capital, have been paid, and something for a surplus fund for future contingencies. Sometimes the dividend is on wages and the interest fund, which is regarded as the wages of capital. The dividend should be paid in stock as an accumulating income property and to make partners of the employees. Often part is paid in cash and the remainder as a deposit subject to conversion into stock or withdrawable when the man quits.

In my own St. Louis business I began in 1886 with equal dividend to wages and capital. Later I made it two to one in favor of wages. Beginning with 1905 I have divided all the profits between wages and the customers in about equal amounts, the capital getting simply interest. Under the original plan the dividends on wages were from 5 to 10 per cent. Under the later plan they have been 30, 20, 25 and one year 10 per cent on wages. Since the first two years the dividends have been paid in stock. The employees and customers now own about four-sevenths of the capital, or about a million in property value. They draw interest on the par value of their stock, which they may invest in stock or leave on deposit.

Friends and critics have feared that the management would be hampered and that a proprietary independence would interfere with discipline. Not a single such instance has occurred in the twenty-six years. Not a voice has ever been raised to change the management, altho the new owners have actual control.

Some economists and friends have asked why the customers were taken into partnership. For the same reason as the employees—they help make the profit, they are better customers when interested.

Let no one suppose there is any magic in the system; men are human, not economic skeletons. It is an influence, not a conversion. The slow accumulation of an income investment is not conclusive to a man or a class used to nothing but wages and cash. But semi-annual cash dividends are educative, the sense of partnership is dignifying, the motive gets understood, and the moral tone is raised. A certificate of stock in a reputable concern is a matter of some pride, and when it mounts into hundreds and thousands the dividend counts in the living.

England is the chief home of profit sharing, France a good second. Twenty-two years ago the South Metropolitan Gas Company in London adopted a plan, applying to all its 5,000 employees, by which wages should be increased ¾ per cent. for each two cents' reduction in the price of gas, the price being, by its charter, subject to reduction if dividends were increased. Thus if better work was done the cost would be decreased, the profit increased, the price decreased, and the dividend on both capital and wages increased. Later the employees were allowed to take stock or leave the money on deposit. And by act of Parliament they were authorized to elect a member of the board when they had $200,000 of stock. In June, 1910, it was shown that the employees had received $2,528,000, of which 5,000 employees now held $2,005,000 in stock; that they had three representatives on the board

of nine members, and their dividend for the past year was $205,000.

Numerous other gas companies have followed the example—235 millions of the 423 millions of gas company capital in Great Britain. Many are recent, yet the employees hold three millions of the capital and their share last year was $444,000; 19,643 employees are included.

Lever Bros., soap manufacturers, have an elaborate and extensive scheme, in which the employees already own over a million dollars of the two and a half millions partnership certificates, on which 10 per cent. dividend was paid last year.

Clarke, Nickolls & Coombes, publishers, have in twenty-one years paid employees dividends of $794,000, and have created a provident and superannuation fund of $165,000. They allow capital 6 per cent., and divide the surplus equally between capital and wages. There are hundreds more or less like these in Great Britain. France was the pioneer in profit sharing, as England was in co-operation. House painter Leclaire made his first distribution of dividend on wages, $4,200, in 1842, and step by step turned it over to the employees. He retired entirely in 1872, giving complete control to the men. The concern has long been the largest painting and decorating house in the world, employing in recent years 1,600 to 1,800 men. The dividends are very large.

Godin had a great stove and iron works at Guise, in the north of France. He was a reformer, a Fourierite, and a statesman. In the 70's he began sharing profits and building a great apartment quadrangle and providing social and educational and recreation facilities. He died in 1888, after having elaborated a scheme and constitution, making a small book, and with a large part of the capital already owned by the employees, provided by will for a complete transfer. The concern has gone on prospering greatly, employing now over 2,000 men at Guise and Liège. Paris has many profit-sharing concerns, notably that greatest of all dry goods stores, the famous Bon Marché. In this, as in most genuine profit-sharing companies, the same spirit which accepts and continues it adds social features, such as pensions, sick benefits, housing and the like.

The American spirit is original and independent from making a workable new national constitution, which Carlyle says is impossible, down to the Morganizing of railroads and factories. It has undertaken some thousands of co-operative and profit-sharing ventures, but throttled or invalidated almost all of them by inventing novel features, instead of following the simple and tried plans. There is nothing abstract, complex or difficult in profit sharing. It needs nothing but a profit-making business, good will, and common sense.

It has not spread greatly, like co-operation, but it is well accredited by abundant success, and it appeals to all employers who want to share their ability with the less fortunate and raise labor to the dignity of partnership.

ST. LOUIS, MO.

# The American Invasion of Tripoli

## A Forgotten Incident of History

BY GARDNER RICHARDSON

SINCE the outbreak of hostilities between Italy and Turkey there has been noticed in the padding of meager newspaper dispatches and in editorials written by former students of history occasional vague references to one William Eaton, an American adventurer, who figured prominently in the history of Tripoli over a hundred years ago. Little additional information is given, except that this soldier of fortune, known as General Eaton, led an army of 500 men across a barren desert and held the Dey, who had been the terror of the civilized world, in the hollow of his hand. Only the lack of support from the home government at Washington deprived the expedition of the permanent fruits of victory.

William Eaton

But who was this daring American of so long ago? To answer this question requires many hours of patient study among the dusty volumes of a library, and many evenings of search among ancient magazines and newspapers. When the facts are gathered we have a true incident of history that rivals the most imaginative novel.

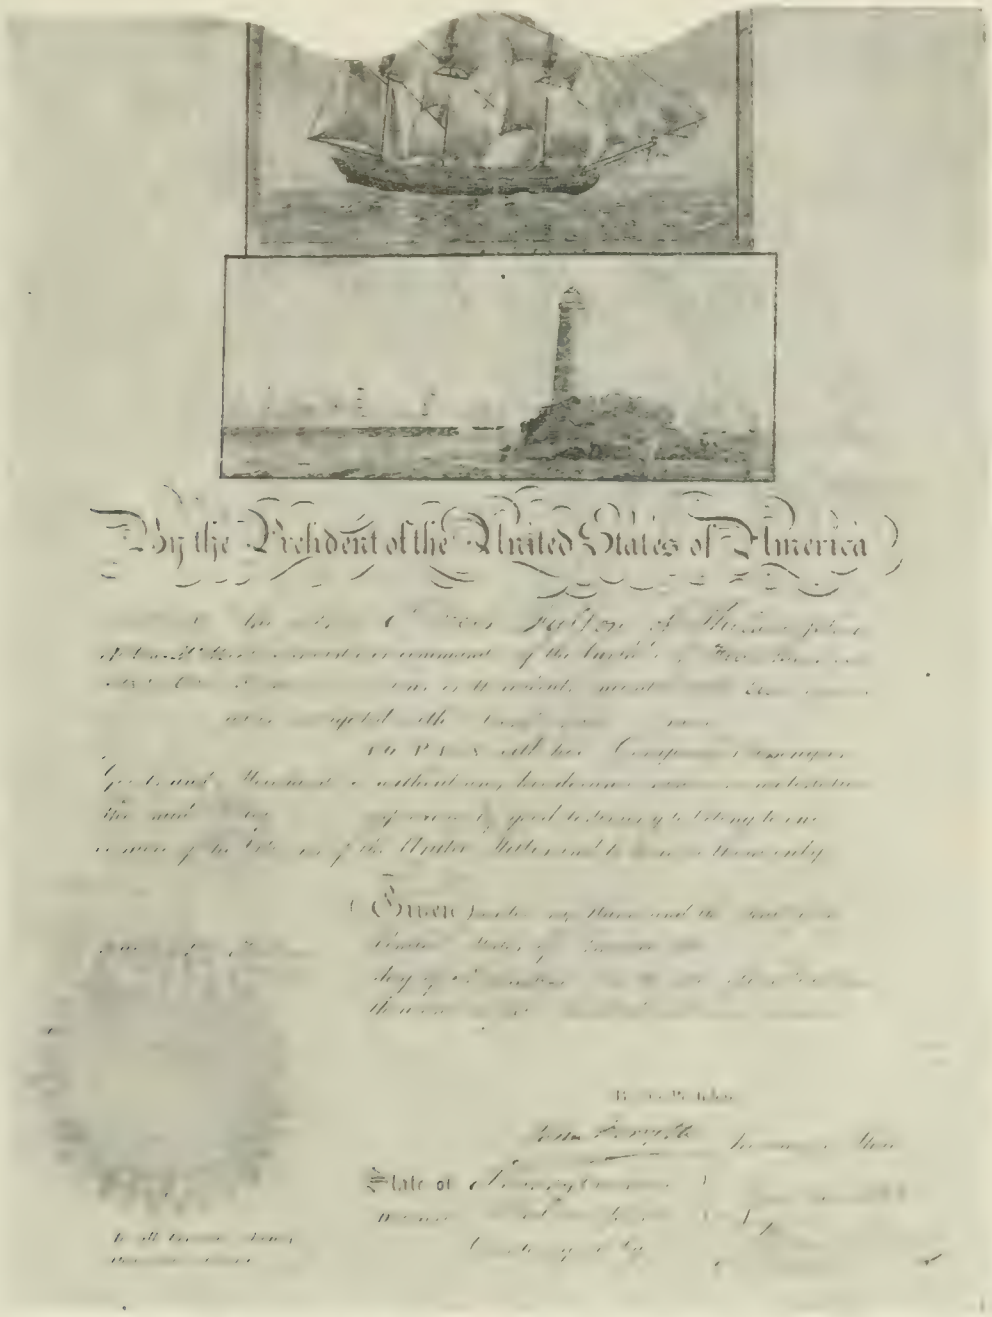
William Eaton was born in Woodstock, Conn., on February 23, 1764, the second son of Nathan Eaton. Contemporary historians record that "William early discovered intellectual vigor and eccentricity." To labor he was extremely averse in his boyhood. It is also noted that his fearless and adventurous spirit led him to climb a cherry tree one Sunday on his return from public worship. He fell, dislocating his shoulder, and was rendered unconscious for three days. At the age of sixteen he ran away from home and enlisted in the army, attaining the rank of sergeant. Upon leaving the army, in order to secure an education, he entered Dartmouth College and graduated in 1790. Two years later he received a commission as captain in the United States Army, and fought with distinction against the Indians in the vicinity of Pittsburgh.

The actual career that brought him into world's history began with his appointment in 1798 as United States Consul to Tripoli. It is hard to realize at this time the power that the Barbary States then exercised over the civilized world. Rather than go to the expense and loss of life necessary to subdue these piratical powers, it was customary to pay tribute for the protection of traders and merchantmen. The United States paid $22,000 as an annual tribute. This was the price for not having a navy strong enough to protect our commerce

in the Mediterranean. Soon after Eaton assumed his duties as Consul he received a notification that the Dey of Tripoli required 10,000 stand of arms at once from the United States. The demand, with a veiled threat of war, greatly angered Eaton. He wrote the Government at Washington that if, instead of tribute and presents, they would send him a 44-gun frigate he would undertake to destroy the Dey and his palace. But President Jefferson failed to approve.

Altho the Government at Washington was timid, General Eaton was made of sterner stuff and waited for an opportunity to strike on his own account. Not until November, 1804, did the chance come for which Eaton had waited. The *de facto* Dey of Tripoli was Yusef Karamauli, who had deposed and banished his brother Hamet, the legitimate ruler. The deposed ruler had fled to Egypt, while his three children were held as hostages in Tripoli. Eaton knew the usurper was unpopular in his country, and conceived the brilliant idea of reestablishing Hamet on the throne with American assistance. He made a special trip to Washington, but all his plans met with a cold reception. Nothing daunted General Eaton returned with a few faithful followers, and joined Hamet in Alexandria. Here he organized the most motley army that has ever been assembled. The force numbered about 500 men, mostly Arabs and Greeks, with a small number of Italian and French veterans. There were only nine Americans in the expedition, but they furnished the moving spirit and enthusiasm for the venture. The line of march was 600 miles long across the desert from Alexandria to Derne, a port of the small State of Barca, a dependency of Tripoli. On March 8, 1805, the strangely assorted army began its march over the unknown desert west of Alexandria. None of the Americans had any knowledge of the country, but their leader was not a man to be daunted by difficulties.

The careful diary kept by General Eaton is a modern "Anabasis." He writes on one occasion that the troops mutinied, demanded more money and refused to go further. He thereupon ordered his little band of nine Americans to take up arms and march away as if to abandon the expedition. This so alarmed the Arabs that they begged the Americans to return, and the march continued.



The expedition proceeded across the desert, suffering great hardships, but averaging about twenty miles a day, driven constantly forward by the indomitable spirit of General Eaton. They passed thru primitive villages where Christians had never been seen by the natives. Finally, exhausted and half starving, the expedition arrived before the walls of Derne. Here, to his great joy, General Eaton found Commander Hull, of the United States Navy, and the brig *Argus,* sixteen guns. He persuaded Commander Hull to join him in a concerted attack on Derne by land and sea.

General Eaton drew up his army on an eminence near the city, while the *Argus* began a bombardment of the ancient walls with her 24-pound cannon. The opposing batteries were soon silenced and a breach made in the walls, thru which General Eaton and his army charged. In a fierce assault the city was carried, and for the first time in history "Old Glory"—then with only fifteen stars—floated over a fortified place in the Old World. General Eaton was shot in the wrist, and fourteen Christians of his party were killed or wounded. The enemy, altho driven out of Derne, raised an army in the vicinity, and for several weeks there were sharp skirmishes between the combatants. Finally a pitched battle was fought between the Dey's troops on the one side and General Eaton's army, supported by the ship's fire, on the other. The battle proved a victory for the Americans.

General Eaton now arranged to make a march on Tripoli itself, when the most unwelcome news arrived that the United States had concluded a treaty of peace with Tripoli, by which $60,000 tribute was to be paid to the Dey in consideration of his renouncing future assessments. Eaton was naturally furious at this sudden ending to his brief but glorious campaign, the only one ever undertaken by the United States on African soil, and in which our little band of countrymen had covered themselves with so much glory.

His indignant protest to Commodore Rogers on board the *Constellation* ends with the eloquent peroration: "In a few minutes more we shall lose sight of this city, which has experienced as strange a reverse in as short a time, as ever was recorded in the disasters of war, thrown from proud success and elated prospects into an abyss of hopeless wretchedness. For no other crime but too much confidence in us. Hamet experiences a reverse as striking. He falls from the most flattering prospects of a kingdom to beggary." The treaty, of course, upset all that Eaton had done, and Hamet was again an exile and a wanderer.

In a letter to Eaton, written by Commodore Preble, after the lamentable end-

FOR PROTECTION AGAINST THE BARBARY PIRATES

ing of this most remarkable historic incident, the following endorsement is found: "The arduous and dangerous services you have performed have justly immortalized your name, and astonished not only your country, but the world.

[illegible] pecuniary resources and naval strength had been at your command, what would you not have done! You have acquired immortal honor, and established the fame of your country in the East."

General Eaton returned to the United States, where he was received as a popular hero. He landed at Hampton Roads, and on his way to Washington was honored at several public banquets. The President, in his message to Congress, made honorable mention of his successes and services. Thruout the United States his name stood exalted. He was considered as having, by his own prowess and enterprise, compelled the Dey of Tripoli to make peace, while the general sentiment entertained was that if he had been properly supported by the American naval force then in the Mediterranean, he would in a short time have been master of the Kingdom of Tripoli. The State of Massachusetts made him a grant of 10,000 acres of land in what is now Maine.

He was, in later years, approached by Aaron Burr, and invited to take part in his treasonable design, but Eaton would have nothing to do with Burr except to bear witness against him in a sworn statement. General Eaton retired, as a private citizen, to Brimfield, Mass., where he died on June 1, 1811.

General Eaton is described as being about five feet eight inches in hight, of a fair complexion, his eyes large and blue, expressive of energy and authority, his mouth large, his cheekbones prominent, and his forehead unusually high. His whole countenance proclaimed vigor, dignity and command.

A resolution brought forward in the House of Representatives to award him a medal was defeated. His application to Congress for reimbursement of the large sums he expended was ignored. These disappointments led to a premature death at the age of forty-seven. The only tangible evidence in this country to recall his victory is Derne street, an obscure thorofare in Boston. Whittier's poem, "Derne," is the only poetic memorial of his exploit. In his native town of Woodstock no stone marks his birthplace, and in Brimfield no monument marks his neglected grave.

Woodstock, Conn.

# The Truth About Intellectual Japan

BY YONE NOGUCHI

[Our readers will remember previous articles by Yone Noguchi, the distinguished poet and author of Japan. The term Bushido is used by the cultured Japanese to express the perfection of their chivalry. In a recent issue we printed an account of the life and work of Inazo Nitobe, the author of "Bushido."—Editor.]

IT has become my habit, quite a proper, even profitable kind of habit, too, I believe, to drop into Maruzen's (a Japanese Brentano) whenever I pass by Nihonbashi Tori, where my questioning on the real nature of the modern civilization is always pointed. The general aspect of the street, with electric cars and foreign buildings (with only bad taste), serves to make my old conclusion more firm that the present civilization is a creation of speculators, wise or foolish —and we are all sad speculators—in the same sense in which Luna Park originates as a business proposition. The psychological interest is in the point that we even believe it was a spontaneous outgrowth of our mood or impulse. We have many a reason to answer to the name of good adopters given us by Western critics.

As I passed by Nihonbashi Tori today my mind, as usual, was on the bookstore; presently I found myself climbing up the stairs into the gallery, where I saw the faces of my casual acquaintances, whose expression at once declared the selfsame love of foreign literature. I

was not troubled by a clerk, as he knew I wished to have my own way with the books. He knew, too, that I would blow the dust off the covers and smooth them with my fingers before I would even open the leaves; I do not mind even straightening them if they are turned up. He knows well the moment when I need him; at that moment I might act, in spite of myself, affectionately and more affectionately with a book which, to be sure, I might take away carefully wrapped in a *fukusa* wrapper of crape. I saw only a little difference between the books of today and those of one week ago; in place of a large stock of Pinero's plays the books of Phillips and even John Galsworthy (whose name was first mentioned in the press only a few days ago) were found; as before, Walter Pater and Nietzsche and George Brandes and Tolstoy are placed side by side.

"Sale of Shaw is slightly falling lately, sir," the clerk said. "Chesterton is the coming man in Japan."

"How about Wilde?" I ventured.

"We carry quite a stock of 'Dorian Gray' and 'Salome,' as you see. However, I think the Japanese literary taste is at the turning point now; the wonder is about Maupassant, who never fails to interest Japanese students. By the way, did you read Maeterlinck's latest, 'Mary Magdelene'?"

I thanked him for his suggestion, but I had grown somewhat tired of this author, and the "Blue Bird" is still left on my table unopened. I kept my slow walk amid the books by Ibsen, Kuropatkin, Strindberg, Carl Marx, Dostojowski, Wedekind and a hundred others; I observed that the work of D'Annunzio was holding a little table at the other side. I gradually entered into my usual meditative mood, and wondered how the Imperial Edict on Education of 1890 stood relatively with those pieces of literature. I dare say that the old idea of loyalty and filial piety, of duty (*giri*) and human affection (*ninjo*) can in no way help toward an appreciation of Leonid Andreieff and Gorky, who interest us tremendously.

Not only do we eagerly read the books of Western writers, particularly those of naturalistic or anarchistic tendency, they are also put on the stage with success; Ibsen, Björnson and Shaw are quite familiar already to the modern theater-goers; the "Lower Depths," by Gorky, which was first played in London in 1905, is promised in a very few weeks by my friend, Kaworu Osanai.

The question is: How can we remain old Japanese in such a composite age, which we fortunately or unfortunately created ourselves?

I do not mean to say anything striking if I say that "Bushido" was an English discovery, or, more true to say, an English creation, in the same sense that we say the Japanese color print was discovered in London or Paris; with that discovery we Japanese have almost nothing to do. We have had, indeed too often, a strange experience which made us happy and sad alternately, being praised for what we least expected to be praised. "Bushido," in some sense, is one of those things. The ethics of our forefathers combined life and death on equal terms, but that creed is today like the Japanese sword and armor. When Dr. Nitobe brought out "Bushido," long before the Russo-Japanese War, it was looked upon here as a sort of fiction; the Westerners, not finding a satisfactory answer for the reason of our victory over Russia, made the fiction turn to a fact. I believe it does not exist in the present heart of Japan; it has declined, if it ever existed, as the color print declined in the last fifty years. When any writer attempts to connect it with present Japan I am sorry to say that he much misunderstands the real condition; he, too, is one who dreams a fairyland out of Japan. Ignorance is often a blessing; it is the magic of distance that makes everything romantic. Japan is still far enough; she gives every chance to a Western dreamer to speculate with his own dream; the true condition of Japan and the Japanese is not very different from any other country in comedy as well as tragedy, with various beliefs and still more various skepticisms. "Bushido" helped doubtless to a great measure in the formation of old Japan; but modern Japan is the creation of the Western civilization we have adopted.

Mr. Shigetaka Shiga, the well-known writer, who himself saw the fall of Port Arthur, said to me that it was the West-

[illegible] more than the Japanese courage that made us the winners, and he laughed in saying that the dead ethics called Bushido had nothing to do with that war. And I should like to insist upon the fact that our present Japanese life has also nothing to do with Bushido. It is more or less a sort of Japanese curio so much valued in the West. If any one ever thinks it is the real spirit of Japan he is much mistaken; and, again, if we think we have any particular Japanese spirit today we are wrong too. If we have it, it is speedily dying.

I am told by a curio dealer that there are almost no color prints left in Japan, while they are sold and bought at the highest prices in New York and London; it made me reflect that it might be the same with Bushido. How little we have it now in our minds! Altho it may sound strange, it is true that we cannot all afford to practise it; its ethics are too expensive for our present life. We have one measure here; that is no other but economy. There is nothing so easy, nothing so cheap to buy as the Western wisdom; if we feel uncomfortable now under its burden, one great fact at once reveals to us that we have failed, after all, to get its real soul. We have many things to say before we can fully acknowledge the success of the present civilization; and, on the other hand, we have lost our old Japanese spirit. But that fact is clear to the people who can compare the old and the new, the East and the West; more often to the people who are totally blind to the West and the new. It is a curious fact that the Government, while she is supposed to represent enlightenment, is always somehow hopelessly chauvinistic, especially for the spiritual problem; therefore she often foolishly acts against the great tide of current thought of the younger generation who are to build the future Japan.

It was mainly the Government's scheme that the revival of the Chinese classics made its sudden appearance; their archaic simplicity was altogether too invigorating for our modern minds. One should have a strength to adjust the influences which he has received already from various sources before he will wholly accept them. What little impression this attempted Chinese revival produced on our life in general may be seen more directly from the fact that many publishers of Chinese classics failed; the unsold books are piled on the shelves of the bookstores. The Confucius vogue was only momentary. How can we forget the luxurious taste of literature and philosophy which we learned from the West at such a great cost of unconditional submission? Let me say that the above-mentioned Imperial Edict of 1890, known as the educational edict, and also the edict of 1908, would be more valuable as a protest; it is still to be seen what relation they will form with our intellectual life, whose true aspect of modern change is still unnoticed in the West.

There is no greater decadence, I mean in relation to the intellectual Japanese life, than that of Buddhism; it may be not only the fault of the priests, who, in fact, do not pray, neither do they preach. Prof. Paul S. Reinsch mentioned in passing in his article on "Intellectual Life in Japan" in the *Atlantic Monthly* something about the study of *Hekiganroku* held at the Mitsui Club. I am one of the members for that particular study. I observed the presence of less than thirty people at the last meeting; I wonder where the professor got that figure of "nearly one thousand members." It is a society of men of leisure who regard Buddhism, especially the Zen sect Buddhism, with no fire or passion, but as an old curio whose appraisement is always a source of delight; if the Zen sect continues to exist, it is from such an attitude on the part of the students.

I am living now more than three years at Enkakuji, the famous monastery at Kamakura, once a great sanctum of meditation and silence. I believe I can speak with authority on the general condition of Buddhistic temples of Japan; even Enkakuji cannot afford to change lately the mats of the chambers or to mend its grass roofs. The condition of the other temples thru all Japan might be the same with only a little difference. The temples that are vassals to Enkakuji, more than ten, barely support themselves by letting their rooms; their impoverished condition is often appalling. And I see another sad instance in Komyoji, also a famous Kamakura temple of the Jodo sect; the roofs and doors

are almost ruined, the rain falls in, and things, even to the holy idols, are left at the will of the winds. However, the renovation of the temple has just been started by the Lord Abbot Hojun Takeda, one of my relatives; the gate tower, which has already returned to its original grandeur, is now touching the bluest sky.

There was a time, I mean in the earlier part of the Meiji era, when the intellectual minds went perfectly astray from any form of religion; that is about forty years ago. But it seemed that they were regaining afterward a general belief in religion and its popularity was resuming its formal shape. How is it today? It has again lost its own place, during the last few years particularly. As the political disturbance and sudden change of Japanese life shattered the religious faith at the time of the Grand Restoration, so the science, the general skepticism, literature and philosophy from the West served to make the present faithless age from which we moderns do not even wish to escape. Whether we are happy or unhappy in this strange condition is another question.

KAMAKURA, JAPAN.

# Efficiency

BY WILLIAM OSTWALD

[This article is remarkable in that it gives in brief space the essence of the philosophy of one of the foremost men of science now living, Professor Ostwald, of Leipzig University, who a few years ago resigned his chair of chemistry in order to devote himself to the application of scientific principles to life. He is an ardent advocate of peace and of the international language, Ido, for he regards strife and the clamor of different tongues with the same abhorrence as an engineer does the friction and noise of his engine, since they are all forms of wasted energy and loss of efficiency. THE INDEPENDENT will publish in a few months an article by Edwin E. Slosson on Ostwald's personality and philosophy. The translator of the following article is Thomas Seltzer, who translated Ostwald's "Natural Philosophy," recently published by Henry Holt & Co.—EDITOR.]

SCIENCE proceeds from the particular to the general. Starting from the consideration of narrow relations and using these as examples, it leads, often in a direct path, to the largest and most general problems of the world and human life. The application of this scientific method for the purpose of reaching an understanding of the larger relations subsisting in the universe is one of the tasks of the monistic philosophy. In fact, it is one of its most important fields of activity. The general thoughts that furnish information to guide the daily acts of the individual in his narrower sphere should also guide us in our conduct and opinions with respect to the larger questions pertaining to the nation of which we are a part and to humanity as a whole. If this were not already an actuality we should demand it and strive for it.

In this brief essay we will start with the consideration of an apparently narrow technical subject and will soon find a natural, inevitable way to extend the ideas thus obtained to larger and larger spheres until we discover a universal law of nature determining the entire character of our world of experience. Its elucidation leads us into the deepest problems that the human mind has been endeavoring to solve for thousands of years.

Scientists sometimes speak of ideal machines. Real machines can be made to approximate ideal machines very closely, but never can be made entirely ideal. An ideal machine turns out as much work as is put into it, tho in a different form. The object of all machines is to convert work from one form into another. For if the work in its previous form answered our purposes, we should have no need of a machine. We could use it as it is. Thus, plant

use the work of the energy of the sunlight directly for the building up of their bodies, while animals and men cannot use the sun energy directly. They are dependent upon plants which prepare their food from the energy of the sun. Plants, therefore, are machines which convert the radiant energy of the sun into the chemical energy of food.

Now both energy quantities can be measured. We know how much radiation reaches an acre of cultivated land in the course of a summer, and we determine the amount of organic substance each acre yields. To find out the quantity of energy it contains we need only burn it and measure the resulting heat. Since the radiation of the sun is also measured as heat, the two quantities can be accurately compared.

The result is very surprising. The energy stored up in the plant is less than a hundredth part of the energy radiated from the sun. The same amount of energy was used up by the plant for its vital functions. But by far the largest portion of available energy was not utilized at all. It was dissipated as heat without having accomplished any definite work.

Plants, therefore, are extremely imperfect machines. Their sole value lies in the fact that they are self-constructive and do not require human skill or exertion, tho their miserably scanty output can be improved by human intervention. A properly cultivated field yields several times as much organic substance as a natural steppe or a primitive forest. Nevertheless, the energy utilized by even the best cultivated field or garden is only a very small fraction of all the energy radiated by the sun. The ratio of useful energy produced to the energy expended is technically known as efficiency. Plants work with very poor efficiency, because they convert only a very small part of the energy at their disposal into the useful form of energy.

With these facts in view let us now consider a modern dynamo, which transforms mechanical work into electrical energy. If a dynamo does not turn out ninety-five per cent. of the work put into it, it will not be accepted. The efficiency of a dynamo is therefore very high, since it lacks only five per cent. of perfection.

The word efficiency, in its scientific sense as meaning the ratio of the useful work produced by a machine to the energy expended, is only an extension of its use in ordinary language. We speak of an orator as being efficient or inefficient according to the strength of the impression he makes upon his audience, that is, according to the degree that the energy he puts forth takes effect, or is useful for the end desired. The German word for efficiency, *Güteverhältnis,* which means the "ratio of goodness," is still more expressive. We say that a certain kind of beet or a certain kind of wheat is "better" than another, if, other conditions being equal, it yields a greater crop per acre. So also we reject a dynamo as "bad" if it does only eighty-five per cent. of work. I may say here, by the way, that in the last analysis the moral estimate of good and bad must likewise be referred to the same principle, since everything that occurs in the world is indissolubly connected with changes of energy, hence also those things about which we have moral judgments.

But how can we reconcile with the law of the conservation of energy the fact that every real machine works with deficient energy and never reaches the ideal of converting all the raw energy that goes into it into the desired useful energy? Are not the two things contradictory? Does not the law that asserts that energy can never be lost imply that the efficiency must always and necessarily be one and the same?

The answer to this question is as a matter of fact already contained in what has been said above. But inasmuch as the error in reasoning that leads to such questions is very natural and very frequent, we must consider this point more closely.

When a dynamo converts ninety-five hundredths of the mechanical work it receives into electrical energy, the other five hundredths by no means disappear from the world. They are merely changed into heat partly thru friction, partly thru the resistance of the wire to the electrical current. Not the least fraction of energy really vanishes from the world, tho only ninety-five per cent. has passed into the useful form, since

the heat arising during the process is a wholly undesired by-product, which is removed as quickly as possible in order not to injure the machine. And when the plants of the fields can utilize only a hundredth part of the available solar radiation, the other ninety-nine hundredths which they allow to escape do not cease to exist, but remain as energy in the form of heat, which is dissipated and does not produce any more plant stuff. The same is the case with the ordinary mechanical machines. Their efficiency is not perfect, because in consequence of friction part of the work introduced into them is turned into heat. The imperfection of machines is therefore always to be traced to the fact that in all changes of energy heat is generated as a by-product.

The same thing happens in the transformation of one form of energy into another as when money of one country is changed into the currency of another. An American dollar is exactly equivalent to a certain number of marks. But this perfect equality exists only on paper. The actual process of changing one kind of money into another is always accompanied by a loss, great or small, according to the circumstances in which we are compelled to make the exchange. While in international commerce payments are made with bills of exchange at very slight cost, the petty money-changer in some out-of-the-way spot extorts shameless fees, if one happens to be thrown upon his mercy while traveling. Instead of the theoretical equivalent one comes away with the cash in one's pocket considerably reduced. But this fact does not vitiate the law of the conservation of the value of money. Altho the money in our pockets has by no means been entirely conserved, the entire sum is still in existence. For that part of it which we miss is now in the pocket of the money-changer. We call the money-changer who takes no fees "good," and we are not likely to withhold the opposite adjective from the other fellow.

It is the same in all cases in which one form of energy is converted into another form for human purposes. The process must always be accompanied by the payment of a fee, part of the energy taking a different course from the one desired and passing off into heat. Now, heat cannot be transmuted perfectly into other forms, and never can be transmuted at all unless there is a difference in temperature. It is not the place here to enter more thoroly into the position occupied by the heat form of energy. It is sufficient to point out that heat plays a rôle similar to that of chips, filings, and the like in other kinds of work. The chips of stone that the sculptor chisels from his block are stone, just as the block itself or the statue into which the artist shapes it is stone. But they can no longer serve as material for making a statue. They represent the *waste*. In like manner the heat arising from friction represents the chips or the waste incident to the production of certain desired forms of energy out of raw energy. Heat, too, is energy, but of all the energies it is the poorest, hence the cheapest, or least valuable. Heat, especially heat the temperature of which is equal to or but slightly higher than its surroundings, is found in such great abundance that it possesses no particular value, and is therefore nothing but an unwelcome or an indifferent by-product.

We must distinguish between two different causes of imperfection to which the low degree of efficiency in the transformation of one energy into another may be due. One of the causes lies in the very nature of things, as expressed by natural laws. Natural laws tell us the highest quantity of the desired energy we can obtain under given circumstances and the size of the fee we shall be obliged to pay under any circumstances. In the case of heat in particular, the transformation of which into mechanical or any other energy is especially imperfect and encumbered with the payment of an especially high fee, we have quite an accurate formula by which, under given circumstances, we can calculate how much heat at the utmost can be converted into the other form. This theoretical ratio of change, then, represents the extreme limit which the actual execution of any such change can approach. It is our practical ideal.

If we examine real machines from this point of view we find they are for the most part still quite far from this

theoretical limit value. And here comes the second cause of defective efficiency, namely, the practical imperfection of all machines, natural as well as artificial. Contrary to the prevailing notion, artificial machines are as a rule much better utilizers of energy than the natural ones. While, however, the first cause of loss of energy lies in the nature of things and there is no way to overcome it, the second cause lies in our own hands. It is a measure of our stupidity or lack of skill, and there has been a steady improvement in efficiency in so far as it is related to the second cause. We need only compare a primitive sledge for the transport of large stones as represented on Egyptian monuments with a modern freight car on rails to realize the improved efficiency of so simple a machine in the course of thousands of years. In the same sense all other machines have been improved, and new ones have been continually invented for the purpose of effecting changes of energy which until recently could be accomplished in only a very imperfect manner. The application of electricity to human purposes is not yet a century old, and yet it has brought about a radical change in our very mode of existence.

It may therefore be said that the progress of technical science is characterized by the fact: first, that more and more energy is utilized for human purposes, and secondly, that the transformation of the raw energies into useful forms of energy is attended by ever-increasing efficiency. The degree of efficiency is a very good measure of culture in this field, for we call every machine and every process better which yields a larger amount of useful energy for an equal amount of raw energy, that is, which works with less waste.

Now, in considering the question how far the progress of technical science in this sense may be deemed an advance toward higher things, we may be inclined to regard the technical matters explained above as something low, infected as some of us may still be with the ancient world's contempt for work. Let me mention a fact which alone is sufficient to give us pause. It is known that Aristotle considered slavery absolutely essential for all times. The economic organization of the Greeks and Romans was based upon the system of slavery. It was slavery that gave the great thinkers of antiquity their leisure and enabled them to devote their time to the pursuit of science. Aristotle could not imagine who would do the rough work if not the slaves. He had especially in mind the supply of raw energy for such simple things as grinding corn and the like, which were still done by hand. By the introduction of animals for work, and later of inorganic energies, like the wind and water, it became possible even a thousand years ago to solve the problem of slavery in a practical way in so far as there was no longer any need of human power for such work. This one example shows what a highly humanizing effect technical knowledge has. It frees man from the most unintellectual, hence the most inhuman, form of work. Without this technical progress we should still be having slaves and we should be removed by a whole world from the social consciousness of a truly modern man. And all morality and ethics would have been utterly powerless to produce a change, for it is only when our stomachs are provided for that we can philosophize.

On the other hand we see men now doing more and more of the sort of work that machines are unable to do in the multiplicity of tasks before us. While the symbol of the older humanity was man and woman digging the earth in the sweat of their brows, the symbol of modern humanity is the man at the switchboard or the propeller guiding with slight muscular exertion but with constant expenditure of mental work, huge masses of energy toward purposeful activity. This elevation of man from a working beast on a level with the ox to a higher being having free sway over endless quantities of energy is an ethical gain which we owe exclusively to technical progress.

In applying the standard of efficiency we not only find that there are ethical values in technology—still by no means as highly esteemed as it should be—but we also find that in the provinces commonly regarded as loftier, and actually loftier, the same criterion of efficiency holds good. Jesus could not say anything higher of himself than that he brought peace to mankind. Unfortunately history showed later that the re-

sult was often enough the very reverse. We have in the meantime grown much more susceptible to the ethical value of peace than nations of former times. If today we are striving for universal peace with ever-increasing success, which even the skepticism of the present chancellor cannot deny, the potent factor that makes for the success of this movement is not the Christian commandment of peace. The Church as such does almost nothing for the development of this idea. It is the recognition of what a tremendous waste of energy not only war itself is but even the maintenance of armed peace. And if we are coming to see more distinctly that the scientific investigator is the only one to whom we can successfully direct the prayer, "Deliver us from evil," then we shall also come to recognize that the concept under which all such negative and positive work is to be united is given in the viewpoint of efficiency.

Let us take the most abstract of all the sciences, philosophy, and the most abstract branch of philosophy, logic. You ask, What can they have to do with the transformation of energy and the improvement of efficiency? Logic teaches to avoid errors in thinking. Let us suppose that the problem of logic has been solved so far that only a very small number of people still make mistakes in thinking. We scarcely venture to imagine what an immense waste of energy would be saved if the preponderating mass of humanity thought correctly. It is equally staggering to conceive what the effect would be if all men acted well and nobly. All the energies now expended upon justice and punishment, upon government and the police would suddenly be released and made available for nobler purposes.

Thus we see that improved efficiency plays an extremely important role in all fields of culture. It is impossible in this brief sketch to give even a slight conception of the vast range and profound depths of this idea. In applying it to one subject after the other thruout the sphere of human interest, we gradually realize that we have actually found a fundamental principle for the totality of human action. Not only the human but the cosmic is governed in the same way by this law of nature. It is necessary, therefore, to express in one brief phrase the aggregate of thoughts that cluster about the relations here set forth. Since the phrase should especially characterize its ethical side, I will call it the energetic imperative. And this energetic imperative which governs our whole life from technics to ethics means: "Waste no energy."

# A Life Sonnet

BY MARION PELTON GUILD

LONG have I loved the sonnet's challenge rare:
"Thus, and thus only, shall thy pace be set,
At every turn new barriers shall be met.
With scrupulous allegiance shall thou bear
The handicap of ancient rule; yet spare
Thy labor if an instant thou forget
The service of that one fair thought, which yet
Must shine clear-cut, the goal of all thy care."

Lo, in this human test undreamed, unsought,
Its note of joy still quivering into grief,
Life calls for poet craft more keen and fine:
To meet each strait demand the past hath wrought,
Yet firmly weave our sonnet clear and brief
Till every strain reveal the Thought Divine.

MILTON, MASS.

# Literature

## A Great American Story Teller

THE publishers inform us that Mr. Merwin has worked upon this memoir during six years. That is believable, altho some of Mr. Merwin's limitations as biographer are suggested by two of his own phrases. On one page he writes: "Mr. Pemberton [his predecessor] hints at more serious troubles which afflicted Bret Harte's last years." Most conscientious biographers would, if they set any store by such "hints," run them to earth, but there is no evidence that Mr. Merwin even made the attempt. Again, "the very absence of information about Bret Harte makes misconstruction easy," Mr. Merwin frankly avows; and it must be confessed that he does little to attack the source of error. This is an old-fashioned type of biography, not documented, but plentifully provided with critical chapters on the writer's heroines, style, and ethics. These are intelligently executed, tho we should have welcomed evidences of genuine research. Printed matter has, indeed, been pretty thoroly reviewed, and it is also to be confessed that Mr. Merwin's volume differs from some American biographies in taking account of its hero's environment, making always interesting, yet disproportionately numerous and extended digressions. Still, such a chapter as that on the California Pioneers helps to establish the contention that Bret Harte was not guilty of "perverse romanticism"—Professor Royce's phrase. Perverse, no; but we are happy to concede that he was a romanticist. As Mr. Merwin says:

"Diaries, letters and narratives written by Pioneers themselves, and, most important of all, the daily newspapers published in San Francisco and elsewhere from 1849 to 1855, fully corroborate Bret Harte's assertion that he described only what actually occurred. 'The author has frequently been asked,' he wrote, 'if such and such incidents were real—if he had ever met such and such characters. To this he must return the one answer, that in only a single instance was he conscious of drawing purely from his imagination and fancy for a character and a logical succession of incidents drawn therefrom. A few weeks after his story was published, he received a letter, authentically signed, *correcting some of the minor details of his facts*, and enclosing as corroborative evidence a slip from an old newspaper.'"

As for the romancer's methods of composition, the present biographer quotes Charles Warren Stoddard:

"One day I found him pacing the floor of his office in the United States Mint [at San Francisco]; he was knitting his brows. . . . He was watching and waiting for a word, the right word, the one word of all others to fit into a line of recently written prose. I suggested one; it would not answer; it must be a word of two syllables, or the natural rhythm of the sentence would suffer."

He was, withal, without affectation. "These fellows see a heap of things in my stories than I never put there," he said, after reading a batch of laudatory notices clipped from English newspapers. Bret Harte, in one of his Scottish stories, says: "The Consul, more *perceptive* than analytical, found her [Mrs. Deeside] a puzzle." Bret Harte was that consul. But what magnificent perceptions!

*THE LIFE OF BRET HARTE. With Some Account of the California Pioneers. *By Henry Childs Merwin.* Boston: Houghton Mifflin Co. Pp. 362. $3.

## A Tory History of England

THE announcement that Rudyard Kipling was engaged upon a history of England aroused considerable interest but not much surprise. "Puck of Pook's Hill" was virtually a history of England, told in a series of flashlight scenes from different periods of the past. This was certainly more interesting and perhaps more instructive than the continuous history which he has now produced in collaboration with Prof. C. R. L. Fletcher.* Nevertheless the authors of this volume have accomplished their purpose, which was to teach patriotism, as they understand it, to the rising generation by a readable narrative of how their country came to be. They have

*A HISTORY OF ENGLAND. *By C. R. L. Fletcher and Rudyard Kipling.* New York: Doubleday, Page & Co. $1.80.

disregarded most of the rules which the modern school of "scientific" historians maintains, but they have not disregarded the constitution of the adolescent mind. They know that young people are more interested in the individual man than the average man, and in wars than statistics. The volume contains more opinions than dates and more illustrations than maps. The narrative has but few dry pages, and the color plates are gorgeous enough for anybody.

Consequently there is no question about its popularity. Nothing like it has appeared since Dickens's "Child's History of England," which enraptured an earlier generation and has not yet lost its attractiveness. This volume has the same engaging qualities as Dickens's history. It has also much the same faults, and in addition a graver fault of its own, that is, it is on the wrong side. It is as strongly Tory as Dickens's history was Whig.

Matthew Arnold was once told that he was getting to be as dogmatic as Carlyle. "Yes," he replied, "but you forget this obvious difference: Carlyle was dogmatic and wrong, whereas I am dogmatic and right." Messrs. Kipling and Fletcher are, in our opinion, dogmatic and wrong. They regard democracy as "still on trial." They speak contemptuously of republics and "their imaginary 'natural rights' of everybody to have an equal share in government." They urge on every possible occasion the importance of universal military training and a big navy. Martial prowess quite overshadows the modester virtues. But we must credit them with one pacifistic concession, apropos of the French and Scottish wars of the fifteenth century: "Too much fighting is as bad for men as too little." They are insidiously inimical toward Germany: "England should always beware of the northeast wind. It blows her no good."

These lessons are enforced with jingo jingles, some of them as clever verse as any that Kipling has written. Some of them, on the other hand, are such as we could have written ourselves, or anybody else, but which we would not have accepted for publication, or anybody else. The volume opens with the tale of the Thames, geology and paleontology ingeniously versified:

"I walk my beat before London Town,
Five hours up and seven down.
Up I go and I end my run
At Tide-end-town, which is Teddington."

The volume closes on a strong major chord with the inspiring poem, "The Glory of the Garden." Every child will have the substance of the Magna Carta fixt in his mind when he has read "The Reeds of Runnymede," and he will forever feel England's need for a navy once he has heard the answer to his question, "Oh, where are you going to, all you Big Steamers?" In "My Father's Chair" Kipling has put the Tory theory of government into four unforgetable quatrains, of which we must quote two:

"There are four good legs to my Father's chair—
Priest and People and Lords and Crown.
I sit on all of 'em fair and square,
And that is the reason it don't break down.
I won't trust one leg, nor two, nor three,
To carry my weight as I sit me down:
I want all four of 'em under me—
Priest and People and Lords and Crown."

## Political Representation

Political writers usually deal only incidentally with the principles of representation; it is a somewhat abstruse topic, dry almost in proportion to its importance. In the midst of our agitation on methods of government come two really significant books devoted to it.

The first, by Dr. Reed[1], is confined to a historical survey of the territorial divisions in all of the United States for whatever purpose, elections, taxation, education, militia, local option, improvement, mining, conservation and what not. It shows a sort of evolution, and occasional clogging by tradition. Dr. Reed's study has not led him toward revolution, but toward reform, and his studies warrant attention to his conclusions, which are stated in brief summaries at the close of the different chapters. He calls for fewer Senators and Representatives and so greater honor in their election, and he thinks the term of the latter should

[1] The Territorial Basis of Government under the State Constitutions. Local Divisions and Rules for Legislative Apportionment. By Alfred Zantzinger Reed, Ph.D. New York: Columbia University. 1919.

be direct enough to make them represent current popular views, and he shows little faith in direct legislation as advocated to-day. The book is a demonstration of the need for "that being whom we all abuse and all utilize—the professional politician, who gives his whole life to the work"; he only has a working conception of the co-ordination of the political divisions and sub-divisions of a state.

Quite another phase of representation is considered by Mr. Humphreys[2]: that is, who is and who should be represented by successful candidates? He stands for minority, that is, proportional, representation. Many will disagree with him, but his analysis of election systems, not only in England but the world over, must be considered, for it is wrought out with judgment after careful study, and enforced by illustrations from "real life." Japan, Sweden, Finland, the United States and other countries give example of wise and unwise methods. The list system and the alternate vote method, the two ways of reaching proportional representation, are adequately and lucidly discussed.

**Sixes and Sevens.** By O. Henry. New York: Doubleday, Page & Co. $1.20.

According to an anecdote printed in one of the monthly magazines, a college student who once posed as the author of "O. Henry's" work wrote to him, upon being exposed, expressing remorse. The impostor said that he began it all in jest, and was unable to extricate himself. The romancer's reply was as follows:

"Of course, I know it was only a prank. Come down to New York some time and we'll do the town together. It was generous of you to stand for some of that stuff."

Some of the "stuff" in the present volume it would indeed have been generous to "stand for." When the publishers say that *Sixes and Sevens* is "material worthy of permanent addition to his nine published volumes" they are guilty of—shall we say, inveterate optimism? Only a few of the twenty-five tales collected here have the ring of O. Henry at his best or near-best. For O. Henry was the most original genius among American storytellers since Bret Harte, and these chips from the workshop are, in nine cases out of ten, only such stuff as magazines are made of.

**The American Dramatist.** By Montrose J. Moses. Boston: Little, Brown & Co. $2.50.

This is a useful book, for it covers a new field, a field that many do not knew exists, for the playwright, in this country, whatever may be his deserts, is not known to so wide a circle as his European confrère. Plays are not commonly published in America unless they are failures, and of those who see them on the stage very few take the trouble to find out to whom they are indebted for the evening's entertainment by reading the author's name in small caps. on their programs. Mr. Moses has been for years a close student of the contemporary drama and has published volumes on "Famous Actor Families of America," Ibsen, Maeterlinck, "Everyman" and the Passion Play. In this volume he has critical sketches of Bronson Howard, James A. Herne, David Belasco, Percy Mackaye, Clyde Fitch, Augustus Thomas, and William Gillette, as well as special chapters on such topics as the melodrama, the kinetoscope theater, "Dramatizing Poetic Drama," a national theater, the open air play, etc., some of which have appeared in THE INDEPENDENT. Mr. Moses never forgets a good bibliography and index.

**The Making of Scotland.** Lectures on the War of Independence Delivered in the University of Glasgow. By the Right Hon. Sir Herbert Maxwell, Bart. New York: The Macmillan Company. Pp. xiv, 242. $1.50.

Sir Herbert Maxwell makes no appeal to students of Scottish history in publishing his Glasgow University lectures for 1910, for the volume makes its appearance without an index, and, beyond the mention of half a dozen authorities in his brief preface, with no bibliography or list of sources. It is, therefore, unnecessary to give a critical estimate of the book as an addition to the history of Scotland in the thirteenth and

[2] PROPORTIONAL REPRESENTATION: A STUDY IN METHODS OF ELECTION. By *John H. Humphreys*. London: Methuen & Co. 5 shillings net.

fourteenth centuries. As an interesting and entertaining narrative of the heroic achievements of Wallace and Bruce, and a vivid picture of border warfare between the English and the Lowland Scots, Sir H. Maxwell's little book may well find a wide circle of readers; and undoubtedly the book helps to an understanding of Scottish nationality, and also of the long continued poverty and backwardness of Northern Britain. Perhaps the greatest contribution that Sir Herbert Maxwell makes in this volume is his elucidation of the reasons for the continuance for three centuries of what was practically civil war. He describes it as the chief sport of the nobility in which they stood to lose if they were beaten or taken prisoners; but in which their lives were usually quite safe, and if they were successful and took their opponents captive, the prize was great. It was only the peasantry that suffered, and the peasants mattered little more to these feudal lords than do the hunted deer or pheasants to their descendants of modern times.

"In mediæval warfare, before the invention of gunpowder, the common soldiers and the farmers and peasants who followed their lords to the field counted only as pawns in the game. The object was to kill as many of them as possible, prisoners being costly and troublesome. But the barons, knights and esquires were regarded very differently. They rode into battle with charmed lives, and it was only in exceptional disasters, such as Bannockburn on the one side, or Flodden on the other, that any large numbers were slain. The great object was to take these gentlemen of coat-armor prisoners, and hold them to ransom. A landed proprietor's farms might be burned and the live-stock driven off; his armed tenants might be unable to pay any rent; but let him have the good fortune to capture some person of distinction on the other side, and he would recoup himself for all loss. That, as well as the love of adventure, was what kept the game of war so long alive between the two nations, who in subsequent history has shown are well able to dwell together in amity. It was a huge gambling transaction, with all the excitement of high play, plus that of brigandage and military glory. But you will see how cruelly it pressed on the peasantry who had nothing to gain but all to lose. Gunpowder, which at last seemed likely to make war more horrible than before, and cruelly to multiply the sufferings of the peasantry, it was only rendered battle less bloody, but it cured the barons and knights of their intense passion for war, because a bullet was as likely to find a billet in the carcase of a noble as in that of a churl."

**The Belmont Book.** By Vados. New York: E. P. Dutton & Co. $1.25.

Mr. Arnold Bennett, who contributes the introduction to this volume, is so clever a person that the reviewer fought shy of him until he had read the book for himself. The reviewer was afraid that otherwise he would want simply to quote a few lines of Mr. Bennett; better lines than any of his own. And even after reading the book, the reviewer finds himself quoting Mr. Bennett's assurance that *The Belmont Book* is not a nature book—but a human nature book; and his information that the author is a novelist who lives in Paris, who knows the best-informed journalists and most influential politicians and best-gowned women; and who, withal, besides knowing what the cut of skirts will be three months hence, "is also aware of what the work-girls think and say," being acquainted with the ideals of the bourgeois, "and of her concierge, and of the flower-seller." We are persuaded that "Vados" is a delightful woman, not so much from what Mr. Bennett tells (and doesn't tell) about her as from the book which she herself writes about the Norman town she names Belmont. As Mr. Bennett says again, her book resembles "The Anatomy of Melancholy" "in treating of everything, including even melancholy"—altho that is not often the motive. The writer's natural humor is assisted by a plentiful knowledge of proverbial wit and countryside humor. She herself seems to be an Englishwoman with an American husband; but the most remarkable thing about her is her universal and unaffected sympathy and understanding. Easter —Our Neighbors—Drouet Lengloiz —Summer—The Herb Garden—The Gentlemen Glassmakers—Harvest—Saint Hubert—La Toussaint: this partial list of chapter headings can scarcely suggest the subject matter of a most informal volume, belonging to no particular genre. The reader will learn here more than a little of French village and rural life, and one's predominant impression is bound to be one of keen pleasure. *The Belmont Book* is altogether delightful; we don't in the least care who wrote it and so modestly conceals her identity.

**The Psychology of Religious Experience.** By Edward Scribner Ames, Ph.D., Assistant Professor of Philosophy in the University of Chicago. Boston: The Houghton Mifflin Co. $2.50.

If religion is less an intellectual formulation and apprehension of creeds and schemes of salvation than an attitude of mind, a life of faith and service, then a psychological investigation of religious phenomena which will reveal the ideas, training and environment necessary to stimulate and nourish that life, is far more profitable than philosophical speculation as to the eternal validity of doctrines or traditions which have served religion in the past. It is this practical value of the subject, together with a conviction that religion is an essential product of the human mind, a necessary development in the struggle for adjustment and adaptation to environment, that allures modern psychology more and more into the field of religious consciousness. Professor Ames treats the subject "from the standpoint of functional psychology," employing the historic and genetic method. This plan affords an opportunity for explaining many religious phenomena in other than intellectual terms and relating them to fundamental human instincts and impulses, but it also eliminates all supernatural elements and subjects religion entirely to the laws of evolution. The importance of primitive forms and ceremonies the author finds in their suggestiveness for interpreting the more complex manifestations, and in the light they throw on the origin and development of religion in the race. He identifies religious consciousness "with the consciousness of the greatest values of life," and traces the persistence and growth of religion in both the race and the individual to its perpetual spring in life's changing activities and interests. Whenever profound changes in the social or individual organism occur, corresponding religious changes must follow. This result clears the way for what will prove to be for most readers the best part of this book, the study of normal religious development in childhood and youth, culminating in "spontaneous awakening" or "normal conversion" during the adolescent period. These chapters are very illuminating and full of suggestion in both what they sanction and what they condemn. Professor Ames has made a substantial contribution to the work so well begun a decade ago by Coe and Starbuck, and his broad, scientific treatment of the subject places the study on a firm basis. The wide survey of the book and the bold standpoint assumed have no doubt led to some errors in detail and some questionable conclusions and definitions, but they have also given weight and clarity to the views exprest. As a whole the book is of unusual value and must influence the practical work of religious instruction and training. No intelligent student or teacher of religion can afford to neglect it.

*

**Essays in Modern Theology and Related Subjects.** Gathered and Published as a Testimonial to Charles Augustus Briggs, D. D., D. Litt., on the Completion of His Seventieth Year, January 15, 1911, by a Few of His Pupils, Colleagues and Friends. New York: Charles Scribner's Sons. $2.50.

Few American scholars have done so much solid and effective work for the advancement of biblical and theological studies as Prof. C. A. Briggs, of Union Theological Seminary. Scarcely a worker of distinction in these fields but is his debtor in more ways than one, for besides his large personal contributions, it was he who bore the brunt of the struggle for freedom in these lines of investigation. This testimonial from more than twenty of his former pupils and his fellow workers to the high esteem in which they hold Professor Briggs comes to him while still a vigorous worker and writer. The extended bibliography of his principal writings which concludes the volume shows the wide range of interest and great industry which have characterized this leader in biblical study. Each contributing essayist is a specialist in the field of his investigation and a diversity of subjects is covered. "Babylonian Eschatology," by Dr. Langdon; "Greek and Hittite Gods," by Dr. Ward of THE INDEPENDENT; "Calvin's Theory of the Church," by Professor McGiffert, and "The Theory of Pleasure," by Professor Gardiner, will suggest the variety of topics discussed outside of the strictly biblical studies. The

book is a splendid tribute to Professor Briggs, and furnishes ample evidence of the broad and careful scholarship which characterizes the American theological students and workers of the present.

**In the Time of the Pharaohs.** By Alexandre Moret. Translated by Mme. Moret. With 16 Plates and a Map. 12mo, pp. xi, 304. New York: G. P. Putnam's Sons. $2.

The author is Professor of Egyptology in l'Ecole des Hautes Etudes, Paris, and is an author of repute on the subject. The present volume is the latest of many attempts to give glimpses into the life and habits of the ancient Egyptians. So much that is new has been discovered from year to year that the latest book, if by a competent scholar, is the best. We have here not a history, not a treatise on religion or architecture, but selected chapters in the great book of Egyptology. The six chapters treat of the restoration of Egyptian temples, Pharaonic diplomacy, Egypt before the Pyramids, and in the Pyramid-building age, the Book of the Dead and the Egyptian Magic. One who reads these chapters will get a clear and correct view of this fascinating subject and wish to learn more. The plates add much to the interest of the volume and are well chosen.

## Literary Notes

....A worthy constituent of Macmillan's "Friendly Library" is the new volume compiled by Temple Scott, *The Friendship of Books* ($1.25). An excellent feature is the index of authors represented, with the titles of their works.

....An interesting article on "The European Problem Play," by Prof. H. L. Le Daum, with numerous bibliographical footnotes, is to be found in the October number of the *Quarterly Journal of the University of North Dakota* (University, N. D.).

....In his new novel, *Rebellion*, Joseph Medill Patterson argues against the Catholic theory of indissoluble marriage, with great accuracy of detail and similitude to life, but with no great literary skill (Duffy & Britton Co., $1.50).

Belle Moses is the author of a volume *Charles Dickens and His Girl Heroines* (Appleton, $1.50). Chapter two tells of "The Real David Copperfield" and there is offered thruout the volume a good deal of biographical material very pleasantly handled.

....The Putnams publish in a handsome volume a record of the lives, achievements and genealogy of the early Irish settlers in Onondaga County, New York, and the outlying regions. (*Pioneer Irish of Onondaga: About 1776-1847.* By Theresa Bannan, M. D. $2.)

....Ministers in churches of the Reformed and Congregational orders will find a helpful and suggestive book in *Public Worship for Non-Liturgical Churches* (Doran: 75 cents), written by Prof. A. S. Hoyt of Auburn, who points out the growing importance of the worship side of the public service which he contends has too often been slighted in the past.

....Samuel G. Camp in his little book *The Fine Art of Fishing* (New York: Outing Publishing Company: $1) tells us that "it is not all of fishing to fish," which is a wise observation. The author is an optimist and in presenting a large amount of useful information he also conveys to the reader the charm of the fisherman's outdoor life. The text is profusely illustrated with the author's own photographs.

....For some years Rev. David Smith, D. D., now professor of theology in Magee College, Londonderry, has written a "correspondence" column in the *British Weekly*, wherein he has answered from week to week letters of inquiry concerning religious subjects. Dr. Smith has made a selection from this correspondence and published it under the title of *Christian Counsel* (Doran: $1.50). The contents are arranged topically, and the counsel, which is directed to both ministers and laymen, is rich in wisdom, and rarely fails to hit the mark.

....A new edition of *Americana*, "An American Encyclopedia for Americans," is announced for publication by Brentano's on December 1. The encyclopedia represents the collaboration of some two thousand editors and contributors, the editor-in-chief being Frederick Converse Beach, of the *Scientific American*. An interesting comparison between the book-making methods of yesterday and today is afforded by the sight of the earlier edition and the new one, side by side. Each volume of the former is two and three-quarter inches thick, against one inch in the latter, which is printed on India paper. Thus the volumes of the old edition weigh six and one-half pounds each; those of the new issue, two and one-half pounds. But in contents, too, there is a marked improvement. Tho the twenty volumes of *Americana* contain a great deal of information concerning things non-American, the emphasis is suggested by the following figures: Vincennes, Sieur de, re-

...Indiana, one and a quarter pages; Vincennes ... Vincennes, Indiana, one quarter page.

William Blake's *Marriage of Heaven and Hell* comes to us in a new edition, with an introduction by Francis Griffin Stokes. The little book was printed at the Florence Press, London, on Aldwych paper, from type that is effective in combination without eccentricity. At least one innovation in composition is to be commended, and the type is itself so excellent that we hope later volumes from this press will show more generous spacing of sentences, and of the running head. There are here none of the author's drawings, wherein "are mingled the beautiful, the grotesque, and the terrible," but The Voice of the Devil, the Memorable Fancies and the Proverbs of Hell are all present, and no omissions. (Dutton; $1.25.)

....The approaching visit to this country of the distinguished Belgian scholar, Franz Cumont, to deliver at our universities courses of lectures on the relation of Oriental to classical religions, gives interest to an admirable volume of his, *The Oriental Religions in Roman Paganism,* issued by the Open Court Publishing Company. It includes courses of lectures before the Collège de France and the Hibbert Trust and is of the first authority. M. Cumont has been best known by his great work on the "Mysteries of Mithra," and this volume has a larger scope, covering as well the worship in the Roman Empire of Isis and the Great Mother. It is a most important period in its relation to the preparation for the conquest of Christianity over the old faiths. ($2.)

....Among the many publications relating to Sunday school work three deserve special mention. The first of these is the excellent little book on *The Evolution of the Sunday School* (Pilgrim Press; 75 cents) by Henry F. Cope, general secretary of the Religious Education Association. It contains a compact, readable story of the whole Sunday school movement. To the Constructive Bible Studies, published by the University of Chicago Miss Georgia L. Chamberlain contributes her sympathetic study of *The Hebrew Prophets* ($1). The work is adapted to the needs of pupils of about the third year in academies or high schools, but it will be found valuable for more mature classes as well. In *The Bible and Modern Life* (Funk & Wagnalls; $1) Mr. Clayton S. Cooper suggests various types of Bible study in harmony with modern thought and needs, and shows how these have been made interesting in many places.

## Pebbles

So many jokes are invented that it is a wonder that there are only a few good ones.—*Atchison Globe.*

THANKS

The *New York Tribune* published a news item from Stamford, Conn., describing the escape from its kennel of a chow dog which, having taken refuge in the woods near Sound Beach, was mistaken for a bear. The Paris *Herald* reprinted the story, to which the Berlin *Post* adds:

"The excitement caused by the report that a black bear was prowling about the outskirts of the city caused much excitement, and this demonstrates that big game is not so plentiful near the larger cities of America as it is supposed to be by some Europeans."

WILL THE POWERS INTERVENE?
A cartoon by McCutcheon in the Chicago *Tribune.*

ACCORDING to the London *Globe,* two Germans were halted at the French frontier by the customs officers. "We have each to declare three bottles of red wine," said one of the Germans to the *douaniers.* "How much to pay?"

"Where are the bottles?" asked the customs man.

"They are within!" laughed the Teuton, making a gesture.

The French *douanier,* unruffled, took down his tariff book and read, or pretended to read. Wines imported in bottles pay so much, wines imported in barrels pay so much, and wines *en peaux d'âne* pay no duty. "You can pass, gentlemen."

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## The Greater Democracy of California

THE California election of Tuesday, October 10, will be a memorable one in the political history of the United States. Never before has so large a body of voters passed specifically upon so many measures of such great importance. There were twenty-three amendments presented to the people at that time and every one of them carried. It must not be inferred from this that the voters were willing to accept blindly anything which went by the name of "progressive legislation." They did not run down the column and mechanically mark crosses after every "yes" as voters sometimes mark party nominees. Each amendment had a separate and discriminating vote which shows even in the total returns. The majorities ranged from over 100,000 for the recall to less than 3,000 for woman suffrage.

The amendments are most varied in character; some involving the fundamental principles of government on which only the people as a whole were competent to decide; others, dealing with comparatively trivial matters, come more properly within the scope of the State Legislature. But for the most part they form a consistent body of legislation, unified by a single purpose, that of increasing the power of popular government and removing the influences which have perverted it. Five of the amendments deal with railroads, which have always exerted in California a dangerous power in financial and political matters. This group of amendments gives the State Railroad Commission of five members power to fix rates, prevent discrimination and regulate not only railroads but other public service corporations such as gas, telephone, street car and electric plants. Six amendments are devoted to municipalities; both extending the power of city governments and making them more responsive to the popular will, enabling them to establish and operate public utilities, and authorizing counties to obtain charters like the cities. Six amendments deal with the courts; prohibiting an appellate court from overturning the verdict in a criminal case on a technicality, authorizing the establishment of inferior courts in places of justices of the peace, making the clerk of the Supreme Court appointive instead of elective, permitting the impeachment of appellate judges, and providing for the recall of all judges like other State officers. Other amendments provide for inspection of weights and measures; for employers' liability legislation; for the extension of the tenure of office of civil service employees beyond four years; for the retention of text-books for four years; for the exemption of $1,000 worth of property in the case of army and navy veterans; for a split session of the Legislature, with a recess of thirty days for the consideration of the measures introduced, after which no new bills can be presented except by a three-fourths vote; for the initiative, referendum and recall; and for the enfranchisement of women.

Now in all this legislation, startling as it seems to the conservative East, there is really very little that is altogether new and untried. It is radical indeed, but not at all revolutionary. Even those who think that California has gone too far

must recognize that it has simply gone on farther in the same direction as all America has been going for the last 124 years. It was obviously the intent of the fathers of the Constitution that the people should not concern themselves directly with government. But it has been the intent of the people ever since to take the business into their own hands. The people have long ago established the right to elect a President instead of entrusting that duty to the free volition of the electoral college. The machinery for the election of senators indirectly is likewise largely superseded and will soon be discarded. Judges are now elected in many States and so are subject to recall at stated intervals. Representatives in State legislatures and in Congress are often very specifically instructed by their constituents how they shall vote, and the referendum is tacitly in use everywhere in the form of constitutional amendments. In the newer Western States there is no distinction in character between constitutional and statutory legislation, and the California amendment only carries this to its logical conclusion in practically abolishing the distinction by making it optional with those who petition for a law whether it shall be voted upon directly by the people or first be submitted to the Legislature. The recall as applied to the judiciary is a novelty and one which we view with apprehension, but the strong popular demand for it is obviously due to the prevalent feeling that the courts have not been confined to purely judicial functions but have become a part of the legislative machinery.

Equal suffrage cannot be regarded as an experiment, for it has been in quiet and successful operation in Wyoming for forty-one years and has gradually extended over the adjoining States of Utah, Colorado, Idaho and Washington. Equality now reigns over a territory of 600,000 square miles and a population of over 5,000,000. This ought to be a sufficiently large test of it to demonstrate to the incredulous men of the East and South that it is safe to entrust the ballot to the hands of their mothers, sisters and wives.

In short, the California election is simply an effort to re-establish a pure democracy. It is a return to the cornerstone of our political system, the old New England town meeting. It has been held that a pure democracy, that is, direct legislation by the mass of the people, was limited to a community whose voters could assemble in a single hall and within reach of one man's voice. That was true so long as the means of intercommunication remained in a primitive state as in ancient Greece and colonial New England. But print and mail and telegraph and telephone and rapid transit have extended the range of intercommunication so it is easier for the people of northern and southern California, tho they be nearly 800 miles apart, to counsel together and arrive at a common understanding than it used to be for Massachusetts farmers of the same town and only eight miles apart. An American State, no matter how large, now forms a true community and so may, if it chooses, govern itself directly. California chooses.

## A Chinese Republic

CAN it be that the ancient, fossilized Chinese Empire is to become a republic? We were amazed when Persia threw away its Shah and declared the republic, and we are still amazed that it continues, notwithstanding the machinations of Russia on the north. We were no less amazed when Turkey, another decayed Moslem nation, put its Sultan in prison and established the form of constitutional freedom, with the old French words of liberty, equality and fraternity, altho with a puppet of a Sultan after the British model. But can it be that the antiquated, indurated Empire of China, pagan China, as we call it, can all at once, in a day, as by a universal impulse of 400,000,000 people, declare itself a republic after the American pattern of Christian civilization? It is too prodigious for faith, and yet that is what seems to be announced, and very likely will be achieved.

Yet why not? Liberty is not Christian; it is human. It is human rights we proclaim when we talk ideally. Where did we get our ideal of liberty? Was it not from the democracy of pagan

Greece in its most glorious period? And did not republican government create its norm in the republic of pagan Rome before it lost its faith, and its pristine glory was marred by the conquest of imperialism? Who knows what grandeur, what power, may be developed, what superior and new civilization, when China awakes fully to consciousness, asserts its Chinese patriotism, and starts on its fresh career, beginning to rise from the stage which we have reached? Men who best know the Chinese declare that theirs is both the most normal and the hardiest humanity, best fitted to win of all races of men.

See what Japan has done in a generation. She has absorbed all of our processes of civilization from the primer to the dreadnought. In that measure of effective civilization which we so often adopt, she has defeated in war the proudest and greatest of the Christian nations of Europe. Why should not China do more than Japan has done? We may admire and we may fear, for we have given China many an insult. Japan keeps her Emperor, and China is likely to have none; what will be the effect on Japan of such an example—Japan only for a dozen years the teacher and model for China? What will be the effect on our own country and the nations of Europe when a republic, mightier and more populous than any of them, enters not only into the rivalry of international commerce and manufacture, but claims all the rights of equal international courtesy? These are parlous questions which it is time for statesmen to study.

Fortunately for the United States, we have, in our relations with China, good deeds to our credit as well as bad to our discredit. We have not, like Japan and all the great nations of Europe, robbed her of her territory and seized her ports, sure to be recovered again when she is ready to demand them by major force. We have sent to China our teachers and given our colleges. We only among the nations have refused to receive exorbitant damages for losses in the Boxer rebellion, and we are now educating by the hundreds her future statesmen and pioneers of industry and civilization. In this revolution our missionaries are protected with the utmost care, for this is not, like other rebellions, a war against foreigners and against reform, but in support of reform and against their own imperial Manchu government.

One must ask how it is that so mighty a rebellion, likely to be a constitutional revolution, has broken out so suddenly all over the country. It could not have happened forty years ago in the localized Taeping rebellion, nor later in the Boxer revolt. But now China has entered already on a new era. She has railroads and telegraphs and hundreds of newspapers. Intelligence goes everywhere. The people are awakened. They are concerning themselves as never before in the interests of their whole nation. They know immediately in Yun-nan or Sze-chuen what is going on in Pe-chi-li, and how their rulers in Peking are bargaining with foreign contractors. They will build their own railroads. They want to be burdened by no foreign loans. It is an utterly new China that has awakened from long sleep, roused by Western learning of mission schools, alarmed by the sudden apparition of despised Japan, indignant at the meddling robberies of more civilized nations, and resolved henceforth, under its new-created sense of patriotism, to create its own career and rule its own destinies.

And China can do it. The whole world is being reformed, reorganized, rehabilitated. A new world era is opening. Possibly this revolution may fail, but the successful revolution is not far off; we are seeing a nation born in a day.

## Mr. Bryan's Inconsistency

At the banquet in Lincoln, Neb., Mr. Bryan sat at President Taft's right hand, welcomed him to the city, took him by the hand and proposed a toast in his honor. Then the President, kind-hearted, desiring to commend this distinguished citizen of Lincoln, said he believed an important part of the pending peace treaties with Great Britain and France—that part which provides for a joint commission of inquiry—had been inserted at the suggestion of Mr. Bryan.

Immediately after this expression of the President's good will Mr. Bryan

wrote and published a bitter attack upon Mr. Taft and the Supreme Court, in the following words:

> Mr. Bryan challenges him [the President] to make public the written and verbal recommendations upon which he appointed Justice White to the position of Chief Justice, and the recommendations, written and verbal, on which he appointed the Justices whom he has placed on the supreme bench. Did he know how they stood on the Trust question, or was it purely accidental that all of his appointees took the Trust side of the question? He signed a publicity bill that requires publicity as to campaign contributions. Why not have a little publicity as to the influences that control the appointment of United States judges?"

It will be seen that this is virtually a charge that Mr. Taft "packed" the Supreme Court in the interest of the Trusts, being under the influence of those who represent these organizations. Did Mr. Bryan have this charge in mind when he took Mr. Taft by the hand at Lincoln? If he believed the President was guilty of packing the Supreme Court for the Trusts, how could he have clasped in a friendly way the hand that wrote the appointments? How could he have sat at the President's right hand and welcomed him to Lincoln? He has since repeated the charge, asserting that "the chain of circumstantial evidence" concerning the appointment of Governor Hughes is "sufficient to convict in a criminal court." In his address at Pocatello, Idaho, Mr. Taft resented Mr. Bryan's attack upon the court "with deep indignation."

Mr. Bryan, of course, found it convenient to overlook the fact that all of the President's appointees voted for the conviction and condemnation of the Standard Oil and Tobacco Trusts, and that the "rule of reason" enabled the court to condemn several subsidiary corporations which the lower court's judgment had permitted to escape. How many men are there in Mr. Bryan's own party who can be made to believe that President Taft has deliberately and corruptly sold the Supreme Court to the Trusts? Why did Mr. Bryan, apparently believing the charge to be true, take Mr. Taft's hand, bespatter him with praise and propose a toast in his honor? Possibly some one will "challenge" him to answer this question.

## The Elimination of the Flag

THESE are hard times for Old Glory. On both sides the northern boundary it is getting knocked out. In this country the Daughters of the Revolution are crusading against its use on handkerchiefs, napkins, tablecloths, dishes and other utensils. This shows how much more patriotic they are than their duly attested ancestors, who delighted in having their country's emblem stamped, embroidered, painted or carved on almost everything that they used or wore.

In Canada the anti-flag movement has gone further. Under the influence of the jingo spirit which overthrew reciprocity the Canadians are striving to banish altogether from sight the detestable Stars and Stripes. They are not annoyed nowadays by its appearance on the covers of magazines, because our patriotic societies have attended to that matter for them by prohibiting its use in this way. It was formerly the custom—and we must confess to have been guilty of it more than once—for magazines as well as buildings to decorate their façades on the Glorious Fourth with the American flag, but since several prominent periodicals have had their editions held up by law on that account the practice has been discontinued. But the Canadians object to the display of our flag even in places where, if anywhere, it would seem to be appropriate, that is, in the historic scenes of moving picture shows. The Over-Seas Club of Toronto has held a mass meeting demanding expurgation of the American flag from all the films. The managers yielded and have notified the American film manufacturers to substitute the Union Jack for the Stars and Stripes in all pictures henceforth, tho they are not sure the Yankee manufacturers will consent to do this in the plays of the Spanish-American and Civil Wars. Now it seems to us that this will lead to a lot of trouble. To have Colonel Roosevelt charging up San Juan Hill and Dewey bombarding Manila under the Union Jack is certainly misleading. If these films are preserved in a museum they may some day be brought forward in support of British claims to Cuba and the Philippines by right of visible conquest. In the case of the Civil War the

confusion would be no less, for the British flag should be on the other side, if on either, since Great Britain supported the rebels with men and money, ships and shouting. And think how it would look in revolutionary scenes. We should see—after the dramatic manner of the moving pictures—Lord Cornwallis at Yorktown hauling down the British flag with his own hands and then General Washington hoisting in its place its twin brother. The English have always preferred to regard the revolution as a civil war, and now they would make it appear so. It seems to us that the name of the Over-Seas Club has been exaggerated in the dispatch. It should rather be the Half-Seas-Over Club.

## Progress in Spelling Reform

Our readers are well aware of the need of spelling reform. They remember the toil they expended in learning to spell a language which has no settled rules, and in their elder days the necessity of going to a dictionary to make sure whether the word is *weird* or *wierd*. They know that their children waste in their school age one or two years in learning to spell, so that they are much behind the children of similar opportunities who have the advantage of phonetic writing. They know what difficulties foreigners have, not in learning to talk, but in learning to write our shockingly spelt language. They also know that the scholars of the country and the teachers as a class greatly desire a reform; that, thru the beneficence of Mr. Carnegie, societies have been formed in this country and in England to promote a system of simplified spelling, and that a certain number of journals, like The Independent, and of publishers, such as Funk-Wagnalls Company and Henry Holt & Co., have made a beginning in the adoption of a few simplified spellings.

It is somewhat important, altho not vitally so, that the American Simplified Spelling Board and the English Simplified Spelling Society should work on precisely the same lines and make the same recommendations. Yet all discussion is good, in order to awaken a somewhat sleepy public; and whatever changes are recommended the two societies cannot but agree on many which are patent. If one society takes a more radical position than the other its effort to persuade the public will have to begin with the less radical on which both are agreed.

There has been such a difference of policy between these two societies. The English society, whose leading officers have been much devoted to the teaching of phonetics in schools, have prest the most radical reform possible without the addition of new letters. Their proposed reform would cover all words, and give to each sound one separate letter or combination of letters. Thus the long vowels, which are the most difficult problem, they designate by adding a second vowel, thus *ai* for *a* in *babe*, *aa* for *a* in *father*, *ee* for long *e*, *ie* for long *i*, and *oe* for long *o*, but *u* doubled, *uu* for *u* in *brood*, and *yu* for *u* in *due*. This, of course, makes a complete change in the looks of a printed page. Take the following example:

"Sum dai, I beleev, English iz destind tu becum the werld langwij, the veehicl ov understanding amung naishonz. But its riez tu this pozishon, az wel az its prezent yusfulnes, iz obviusly hinderd bie the abserd speling, which pruuvz such an obstacl tu our oen children, eeven thoez ov naitivborn pairents."

The American Simplified Spelling Board has been far less radical, seeking what seemed feasible, and looking to a gradual approach to phoneticism. They have sought to reduce the glaring complexities after the prevalent English analogy, and to drop, as far as possible, useless letters. If less radical their method has seemed to them more practical and more likely to secure public favor.

It was desirable that representatives of the two societies should meet in London in September and compare their views with the hope of harmony. It was agreed at this meeting that a considerable simplification of English spelling can be effected by (1) dropping clearly superfluous letters; (2) substituting a single letter in its familiar use for a more or less cumbrous combination of letters having the same sound; (3) bringing eccentric spellings under a prevailing rule of analogy. These reforms would not greatly disturb the looks of a printed

page, and would be of much value. But it was agreed that these reforms would not meet the whole difficulty, especially in the long vowels, as to whose notation agreement has not been reached, the English society desiring absolute uniformity, as in the example given above, while the American representatives are not prepared for complete phoneticism. While no full agreement was reached, the English society, as a result of this conference, agreed to accept for provisional use the dropping of silent letters when it does not involve a change of pronunciation, as *dout* for *doubt*, *definit* for *definite;* also in the case of a doubled consonant drop one if no confusion would result, as *batl* for *battle; t* for *ed* in certain preterits, as *prest* for *pressed;* and, finally, substitute *f* for *ph.* These are among the recommendations which the Americans had accepted, and the consent to accept such provisional and partial reforms proves the coming together of the two societies.

We hope the British Simplified Spelling Society will be able to go on with its work on this basis, emphasizing the importance of finally reaching a pure phonetic system, but also aiding a more gradual present reform. Absolute phoneticism is the ideal ultimate aim, with one character for one sound, but this is in the distance, and it will require a new and enlarged alphabet, or a number of diacritic signs. The adoption of such an alphabet, however, must provide for sounds like the French nasals, the German and Arabic gutturals, and the Chinese tones, and can be prepared only by an international commission. This work is needed; why could not some society, or the Carnegie Institution, take it up?

## Flying

In a recent number of The Independent Mr. Grahame-White states that flying with the aeroplane, while easy to learn, is never safe. He tells us that a very great deal of skill is required to pilot a machine when the wind is gusty. "Then an aero swings and rolls about in the air, sometimes in a very alarming way. Incessant watchfulness is necessary to keep it upon an even keel; and none but experienced flyers care to ascend unless the weather conditions are good." It is, however, in the contingency of being compelled to descend that the hight of danger is met, and we are told that "to keep one's head at such a moment," when the motor fails the pilot, and make a safe descent, "means the exercise of a great deal of skill; and this only comes by experience." Evidently there is no chance for getting experience but by dangerous exposure. We note two cases within the State of New York during the last month, when aviators have been jeered by the crowds for not flying during unstable weather. In both cases the aviators rose into the air only to be dashed down to death. If any can see in the present stage of this art anything very hopeful, beyond the excitement of unusual motion and the conquering of certain difficulties, we should be glad to hear from them.

It is very clear that aviation has not reached as yet any practical stage of development, where it can serve us in the ordinary affairs of everyday life. It is so encompassed with danger that it cannot even touch the problems of transit or travel and the carriage of goods. It has increased the number of those who are willing to venture life for a sensation. We imagine that Lord Byron would be delighted to be with us just now, for he cried out in despair for "one new sensation." With Count Zeppelin, Lord Byron might be happy for two hours, and if his airship came down with a crash the two might rise from the wreck thoroly happy. We do not see, however, any particular advantage in increasing the number of those who are willing to risk life and limb without a higher motive.

What we want to solve is not the relative advantages of monoplanes and biplanes, or any other such profundity of a mechanical sort. Structures costing a large amount of money, and involving a large amount of risk for themselves and danger to their occupants, are of no special importance to the people. Mr. Atwood certainly achieved a triumph in flying from St. Louis to New York, but that was all. The people are not going to travel in that way, and we cannot see that there was a slightest gain in any direction to be credited to this achieve-

ment. Mr. Atwood announced that he would at once withdraw from aviation as something too unsafe. Count it all up and no one yet has helped us to fly. We have not gained one point in the art of popular aviation—that is, safely and surely navigating the air.

The birds have got the start of us; they have grown wings. We are handicapped along that line by the fact that from the very point where the birds' wings grow we have already grown arms. The whole mammal kingdom has, in one way or another, used up that special part of the skeleton where the wing structure is joined; used it up with legs or arms; and the fish has used it with fins. So far as we know the fish are satisfied in the water, and the birds are satisfied in the air, but the arm bearer has become dissatisfied on the land. He finds that he can use his arms fairly well for fins in the water, but not for wings to divide the air. Why not? Are we sure that the cannot work out the problem in that direction? Is a device absolutely hopeless, by which a man can lift himself in the air, and with which he can convey himself safely from place to place? A Frenchman promises us that before another year is out he will have something of this sort ready, and that he will fly at will where his interests direct him. Mr. Wright is working up some such idea in North Carolina. We should like nothing better than to write it down, that whoever has marketing to do may hitch himself up and alight with his basket at the door of some store, built not on the dusty street for the convenient access of horses, but in the midst of a lovely garden or grove.

It needs no wild stretch of the imagination to foresee an entirely new sort of city construction. The present arrangement was devised, not to accommodate human beings, but to accommodate horses; man has only a narrow sidewalk. Before the Civil War many of the Southern cities did not have even this sidewalk. The horseman rode to the store door, struck it with the handle of his riding whip, and called for what he wanted. Will we some day get so far out of the horse age that we can have all the street to ourselves, and can get rid of animals and their filth altogether? Can we break up the rows of houses; plant our stores as we may also our homes, isolated, in groves or orchards? The ideal is at least pleasant to anticipate. It would make a revolution, socially as well as architecturally, and we cannot see that it would do us any harm from the standpoint of art or of comfort.

**Governor Wilson and the President**

When Governor Woodrow Wilson says, as he did last week, that "the President of the United States gives out one utterance one day and then the next day takes it back and apologizes for it" (referring to what the President has said about enforcing the Anti-Trust law), he is not just to Mr. Taft. The record of the latter's public addresses does not warrant this assertion. If the Governor will read the published reports of those speeches he will see his error. Mr. Taft has been sufficiently definite in setting forth his policy as to the execution of the law. It is true, however, that business suffers by reason of uncertainty as to enforcement of the statute. But this is due to the possible scope of the policy of Mr. Taft and his Attorney-General, rather than to any inconsistency in their utterances. If all incorporated consolidations in the making of which competition among the constituent parts was ended must be torn to pieces simply because the original competition ought to be restored, and if Mr. Wickersham has a list of "about one hundred" consolidations doomed to be dissolved, hundreds of thousands of shareholders and many managers of great companies are made cautious and subjected to restraint by anxiety. If such ending of competition, and not injustice in formation and management, is to be the offense which demands prosecution, business will be affected unfavorably for some time to come. Governor Wilson should define his own attitude toward this question, which presents some difficulties.

**What Is a Mob?**

We regret that Cardinal Gibbons and Archbishop Ireland should have spoken of the initiative, referendum and recall as "mob law" and "mob-

contrary. If by a mob is meant a sudden rush of people fired by frenzy to do an unlawful act, there is no mob law in the case, as Senator Bourne has remarked. The initiative and referendum do not act suddenly, for there is not less than four months of discussion before a vote can be taken. In the case of recall this measure cannot be invoked until at least 25 per cent. of the voters have individually signed petitions for it. This takes weeks and involves great publicity; and the recall election does not take place till twenty days after the petition has been filed. All this is the very reverse of the mob frenzy. Or if by the mob is meant the common people—and we cannot see what else it can mean—it is unfortunate that such a slur should be cast on the great mass of the citizens. It indicates too much of the aristocratic feeling, as if popular sovereignty were not quite safe, and the people cannot be trusted. Of course the people can make mistakes and often have; but their chosen leaders have made quite as many. Oregon has now had nine years of experience in these reforms, and its campaigns have never been so free from fraud, nor its government so free from graft. Fortunately Church dignitaries, even the wisest and best, can only give advice on political matters like the rest of us, and have no authority.

**Justice Harlan**

Justice Harlan was a Kentuckian of the finest of that fine stock. He was a thoro lawyer, and yet he was not a mere textual lawyer, of whom we have too many, who study the words of law so closely that they forget its purpose of justice. It was said of a famous Vermont Senator, when he first was sent to Washington, that he was so sharp-sighted that he could see a fly on a barn door a mile off, and yet not see the door. That was not like Justice Harlan. He was very independent and at times when some principle of liberty was involved would give the sole dissenting opinion. He was a man of deep religious convictions, conducted a Bible class in a Presbyterian church, and at one time thought of resigning from the Supreme bench to devote himself to the interests of the foreign missions of his Church. One of his sons is a clergyman, and has been much interested in the establishment of a university in Washington which should especially appeal to young men preparing for the diplomatic and consular service of the country. For nearly thirty-four years Justice Harlan has served in the Supreme Court, having been appointed by President Hayes. It is remarkable that President Taft in the three years of his term should have had the appointment of a majority of the members of the court.

**Socialism in Higher Education**

It is interesting to observe how Socialism finds a home in our higher institutions of learning. The Intercollegiate Socialist Society has chapters in twenty-nine institutions, including Harvard, Yale, Brown, Columbia, Cornell, Pennsylvania, Chicago, Stanford, and many State universities. There are chapters even at Union and Meadville theological seminaries. The president is J. G. Phelps Stokes, and the first vice-president is Upton Sinclair. The "Annual Statement" gives the names of over twenty professors in colleges and theological seminaries who have given the society financial support. Among these institutions we notice Union Thelogical Seminary, the General Theological Seminary, the Meadville and the Pacific Theological seminaries, also Harvard, Princeton, Chicago, Cornell, Trinity, Rochester, Dartmouth and Wellesley. Naturally, not one of these institutions which have chapters or supporters in their faculty is Catholic, for in that Church Socialism has been banned. One speaker sent by the society has spoken before nearly five thousand students in eighteen institutions.

**The Crackling of Thorns**

As a specimen of the curiosities of a sort of theological abuse not now generally regarded as proper, we may give the following from an editorial in a St. Louis religious journal:

"Protestantism is simply ruffianism organized into religion. The first Reformer, Martin Luther, was the vilest blackguard of all time, in comparison with whom the Greek Thersites was a polished gentleman. All his associates in the sacrilege of sanctuaries and sacking of religious houses were almost to a man men of the lowest characters and beast-

liest morals. . . . The older heretics got ashamed of it [the slanders against the Church] and themselves long ago, but the remnants of the historic filth after the mess had been carted away in the night, was gathered up by the two most recent sects, the Baptists and the Methodists, and they are today sole dealers in the filth and manufacturers of the scent that is now suffocating and sickening the decent world."

Now, we do not suppose the priestly editor believes all that or feels all that venom. It is simply his sort of reckless fun. He is just cavorting about, in no such bad humor as he assumes, and while shaking our heads, we laugh a surprised laugh, as he wanted us to.

**Primitive Mind-Cure**

One gets an idea of the antiquity of the mind-cure in the old Babylonian incantations addrest to a disease under the impersonation of an evil spirit. Here is an example given by Professor Jastrow in his "Religious Belief in Babylonia and Assyria":

"Away, away, far away, far away!
For shame, for shame, fly away, fly away!
Round about face, away, far away!
Out of my body, away!
Out of my body, far away!
Out of my body, for shame!
Out of my body, fly away!
Out of my body, face about!
Out of my body go away!
Into my body do not return!
To my body do not approach!
My body do not oppress!"

Such repeated and imperative impulsions on the mind as these could not have failed to accomplish many miraculous cures; and they were, as in the more modern "Christian Science" cures, and those of the "Emmanuel" movement, accompanied and guided by religion.

**Spotless Town**

New Britain puts it in this way: "Are you helping the Spotless Town crusade?" Then there is a "Spotless Town League," hundreds of boys and girls wearing a blue and white membership button, and each one committed to the cleaning up of his own premises. This movement originated as a church affair, and it has spread all over the State of Connecticut. What is asked for is: Take away the ashes and dirt heaps from the back yards and send them to a dumping ground where they can enter into the composition of good soil. Please clean out your cellars, your stables and your sheds, at the same time whitewashing and sometimes spraying with kerosene your fences and henhouses and cellar walls. Burn the rubbish that will burn or will not make compost, saving the garbage for the cows and hogs. Do not mix ashes or any similar stuff with the garbage and so spoil it for the cow. Do not throw old paper and banana skins into the street, but burn the paper and remember that horses enjoy the banana waste. After you have cleaned up a dirty spot plant something beautiful in it. Never forget that rotting garbage makes bad air, that bad air does not feed weak bodies, and that weak bodies make big doctor bills. Old tin cans hold water enough to breed mosquitoes, and dirty yards and stables cause flies, sickness and death. In other words, make decency and cleanliness and wholesomeness a town affair, and put yourself well in line with the public welfare as well as your own happiness and health. Clean up for the sake of your neighbors. This town pride, which we are glad to see growing, is the beginning of that sort of public spirit which builds wise states and nations of the right sort.

The Church of England, which talks of shortening the text of the Ten Commandments, and making other needed amendments in its ritual, is now confronted with the question how to give "earth to earth, dust to dust" in the case, now becoming frequent, of cremation. The Convocation of Canterbury has been considering a resolution which recommends that the second part of the Burial Service be said in the crematorium, and that as the body passes out of sight into the furnace these words be uttered:

"We therefore commit his body to the fire to be dissolved, looking for the resurrection of the body and the life of the world to come."

This does not please all, as some would use the old familiar words over the ashes when they are buried, while there are those who think that cremation is unchristian and denies the resurrection of the body. The Bishop of Oxford does not regard it as "characteristic of a Christian practice." Nevertheless it is a growing practice.

Readers of Mr. Moses's article on teaching American drama in last week's issue will be interested to know that for the second time the Craig prize for an original drama written at Harvard or Radcliffe has been awarded to a woman. Last year the winning play was acted for many weeks at the Castle Square Theater, in Boston. Academic instruction in the drama does not produce a purely academic theater, it would seem; and women as well as men can profit by it. Women have produced none of the great classical dramas, but of the Irish playwrights of whom one hears so much nowadays one of the most liberally applauded is Lady Gregory, while another lady, Miss Horniman, is the good angel of the repertory theater in England as well as in Ireland.

Among the Indian princes the Gaekwar of Baroda has been known as especially enlightened and progressive, so that it has been a great disappointment that he has consented to the marriage of his daughter as the second wife of the Maharajah Scindia. Inasmuch as at the time of the marriage King George V and his Queen would be passing thru Baroda on the way to be acclaimed Emperor and Empress of India at Delhi, they would be expected to grace the wedding with their presence, which might not be agreeable to them. We are glad to learn that the awkwardness has been recognized and the date of the marriage has been changed.

We hope it is true that the Cuban Government is seriously considering a discontinuance of the national lottery gamble. It should not have had a beginning. An addition of $3,300,000 to the island's revenue has been obtained at the cost of demoralization and misery. There is plenty of evidence that Cuba's laborers and their families have suffered greatly by reason of the trade in tickets. A respectable government should not resort to such a device for increasing its income.

During Mr. Taft's tour thru the country, neither his interests nor those of his party have been promoted by not wholly undeserved public criticism of certain members of his official family. And now the load which he and his party must carry is made heavier by Vice-President Sherman's attack upon the policy of conservation. Mr. Sherman knows, of course, that he can find very little support among thoughtful men of either party for his doctrine that each generation should utilize natural products with a view to its own interests alone, and let the succeeding generation look out for itself.

A curious interference on the part of the honey bee in our economic questions has occurred in the tobacco raising sections of the country. They are gathering nectar from the tobacco blossoms, and some of the apiarists complain that the honey is flavored in a way that is not either delightful or wholesome. Apple honey has a touch of the apple aroma, and orange honey is decidedly flavored from the orange blossom. The tobacco plant has the same power to affect the nectar which it yields. Will this honey have somewhat of the tobacco effect on those who use it?

A report from London that Great Britain and Germany are negotiating for an agreement looking to the reduction of armaments looks almost too good to be true. The two nations have been trying for years to excel each the other in military preparations, and ill-will has been constantly fostered between the two over the matter, until, in Germany at least, the financial burden has become almost too heavy to be borne. It is said that Germany initiated the negotiations, and we may be sure that Great Britain would gladly reciprocate.

It looks very much as if in Chester County and the town of Coatesville no one could be convicted for murder. It is doubly and trebly disgraceful for Pennsylvania if in that old free State a negro can be taken from the power of the authorities and burned to death and hundreds know who incited the crime, and yet nobody punished for it. Some half dozen have already been acquitted.

Now, wouldn't it be a joke if China got woman suffrage before New York?

# Insurance

## Loss of Life in Shipwrecks

While the loss of life in shipwrecks seems to most people a matter of the distant past, the aggregate number of lives lost on the ocean is still large. A record of the last twenty years made by an English expert shows that there were 3,980 wrecks and casualties to ships belonging to the United Kingdom, which were attended with fatal results to 22,937 persons, of whom 18,660 were members of the crews and 4,277 were passengers, pilots or other persons. The average annual loss of life during the twenty years was 1,147 persons, consisting of 933 crew and 214 passengers. Compared with this average the figures for 1909-10 show a total decrease of 197, the number of seamen lost being less by 243, while the number of passengers was higher by 46. The number of seamen lost in sailing vessels in 1909-10 was 214 and of passengers 14, against averages of 519 seamen and 23 passengers for the past twenty years. The number of seamen lost in steamships in 1909-10 was 476 and of passengers 246, against averages of 414 seamen and 191 passengers for the past twenty years. These figures are interesting, among other reasons, in showing the larger loss of life among the crews than among the passengers of vessels.

The board of directors of the Ætna Accident and Liability Company of Hartford has voted to recommend to the stockholders that the capital stock and surplus of the company each be increased to $1,000,000. It is planned to issue 5,000 shares of new stock at $200 per share, $100 of this amount to go to capital stock and the other $100 to surplus account. This plan involves placing an assessment of $50 per share on its first 5,000 shares of capital stock, the assessment to be credited to surplus account. With a capital stock of $1,000,000 and a surplus of $1,000,000, the Ætna Accident and Liability Company will be one of the strongest companies engaged in the miscellaneous casualty business.

The Fidelity and Casualty Company of New York report 21 boiler explosions in the last month, 78 elevator accidents and 9 bursting flywheels. Most of the elevator accidents enumerated were of people falling down the shaft or being caught between the car and building. While a considerable proportion were due to carelessness, a large number were from causes beyond control and illustrate the necessity of every man being amply protected against an unexpected accident.

Insurance against risk of capture at sea has been taken on British ships carrying coal to Turkey, as it was thought they might be seized by the Italian fleet on the ground that the coal was intended for the Turkish navy. The rates were by no means heavy. An official of Lloyds said that the greatest concern arose from the fact that the ships were navigating in places without the aid of the coast lights, which had been put out since the commencement of hostilities.

A representative of the Prudential Insurance Company, of Newark, was on hand at Austin, Pa., soon after the flood to represent the company. Acting under special instructions claims were paid without the customary doctor's certificate, where identification was reasonably certain. The Prudential had about 500 policies in force in Austin, which is equal to about one-quarter of the population. The fire insurance loss on account of the disaster will be small.

The Bohemian violinist, Jan Kubelik, has arrived in America for a tour. His press agent announces that his fingers have been insured for $225,000 in a number of foreign casualty companies.

## The Year's Crops

The Government's crop report for October, issued on the 9th, was accompanied by preliminary estimates of the quantities to be harvested. A slight betterment of condition was shown for corn, and a much larger gain for potatoes and tobacco. The corn crop, however, will fall 360,000,000 bushels below last year's; the comparative loss of potatoes will be 60,000,000 bushels, or nearly 18 per cent., and improvement of the condition of tobacco in one month from 71.1 to 80.5 does not prevent a loss of 269,000,000 pounds, or 27 per cent. But this year's tobacco acreage is only 72 per cent. of last year's. There is a good crop of flaxseed to make up for last year's shortage, but the estimate for oats shows a loss of 253,000,000 bushels, or 22 per cent.; there is only a two-thirds crop of hay, and the yield of wheat is less by 40,000,000 bushels than last year's, which was very near to the five years' average. The figures are given below:

| | Indicated in 1911 | Harvest in 1910 |
|---|---|---|
| Corn | 2,759,348,000 | 3,125,713,000 |
| Spring wheat | 200,367,000 | 231,399,000 |
| Winter wheat | 455,149,000 | 464,044,000 |
| Total wheat | 655,516,000 | 695,443,000 |
| Oats | 873,641,000 | 1,126,705,000 |
| Barley | 145,951,000 | 162,227,000 |
| Rye | 30,677,000 | 33,039,000 |
| Buckwheat | 15,699,000 | 17,239,000 |
| Flaxseed | 24,405,000 | 14,116,000 |
| Rice | 22,582,000 | 24,510,000 |
| Potatoes | 278,551,000 | 338,811,000 |
| Hay, tons | 46,969,000 | 60,978,000 |
| Tobacco, lbs. | 715,543,000 | 984,349,000 |

From a later report we learn that Canada's wheat crop this year (British Columbia excluded) is 205,000,000 bushels, against last year's 150,000,000, and that Canada's crop of oats has been increased from 323,000,000 bushels in 1910 to 368,000,000 in 1911. In Western and Central Europe, all forage crops have suffered because of almost unprecedented drought. Favorable reports concerning the crops to be harvested in Argentina, Australia and other southern countries in December and January have been received. Argentina has increased her wheat area by 1,586,000 acres, or about 10 per cent., and her oats area by 467,000, or 23 per cent.

Unusually early development of the new cotton crop, large offerings, and an expectation that the yield will exceed 14,000,000 bales, have depressed the price of this staple in all our markets. Last week the price at New York and in the South fell to about 9¼ cents. A month ago it was 3 cents higher. The decline is regarded with much satisfaction by manufacturers of cotton goods.

*

....A considerable increase in the prices of canned vegetables and fruits is predicted by Western trade authorities.

....It is estimated that the American people's expenditure in the last ten years for automobiles and the maintenance of them has exceeded $1,000,000,000.

....The Pearson syndicate will invest $3,000,000 in a large wood working plant at El Paso. It owns 3,000,000 acres of timber land in the neighboring Mexican State of Chihuahua.

....The Annapolis Valley in Nova Scotia has this year an apple crop of 1,500,000 barrels, the largest ever known there, and the growers find it very difficult to obtain barrels enough for it.

....For the first three-quarters of the present year the Transvaal's gold output was 6,099,442 ounces, against 7,534,120 for all of 1910, and 7,280,542 for all of 1909. It will be seen that the full year 1911 will establish a new high record.

....The Canadian Pacific, Canadian Northern and Grand Trunk Pacific railway companies have agreed to purchase 215 acres in St. Boniface, across the river from Winnipeg, and to erect there stockyards, abattoirs and cold storage warehouses, at a cost of $5,000,000.

....According to a recent census report the supply of cotton in this country for the year ending with August was 13,655,479 bales, of which 7,781,414 bales (or 57 per cent.) were exported. About 38 per cent. of the spindles operated are now in cotton-growing States.

# The Independent

VOL. LXXI NEW YORK, THURSDAY, OCTOBER 26, 1911 No. 3282

## Survey of the World

**The La Follette Conference**

Two hundred Republican insurgent leaders, representing twenty-eight States, met at Chicago, October 16, and indorsed Robert Marion La Follette, of Wisconsin, for President, to succeed Mr. Taft at the expiration of his first term. They also declared in favor of a direct primary as a means for the expression of the popular will. The La Follette resolution was framed by a subcommittee of five and revised by former Secretary of the Interior Garfield and Representative Lenroot, of Wisconsin. The name of the Wisconsin Senator was frequently spoken by the delegates, and was always cheered. The resolutions were, in part:

"The progressive movement is a struggle to wrest the control of the government from the representatives of special privilege and restore it to the control of the people. The issue is the same in all the States, tho the problem may be presented in different ways.

"In the national field, the control of Government by special privilege is evidenced by the influence and power of the reactionary leaders in both parties in checking or preventing the enactment of progressive policies pledged by the Republican party.

"The present condition of uncertainty in business is intolerable and destructive of industrial prosperity. It is worse than idle to leave the question of whether great business enterprises are legal or not, merely to judicial determination. Industrial corporations should, by affirmative legislative enactment, be given definite rules of conduct by which business shall be made safe and staple, while at the same time the interests of the public should be fully safeguarded. We seek constructive legislation, not destructive litigation.

"The record of Senator La Follette in State and nation makes him a logical candidate for President of the United States. His experience, his character, his courage, his record of constructive legislation and administrative ability meet the requirements for leadership such as present conditions demand."

Next to Illinois, Wisconsin, Minnesota and Nebraska sent the largest delegations. Medill McCormick called the meeting to order; George L. Record, of New Jersey, was elected chairman, and Senator Clapp, of Minnesota, was the first speaker.——A branch office of the Washington headquarters of the National Progressive Republican Campaign Committee will be opened at Chicago. A second branch is likely to be established on the Pacific Coast.——The Democratic National Committee will meet in Washington, January 8, to fix a time and place for holding the Democratic National Convention. This will be a month later than the Republicans will meet for the same purpose, and means that, as usual, the Republican will precede the Democratic convention, which probably will be called for the latter part of June. Chicago is about the only city now under consideration by the members of the Republican committee. There is a spirited contest over the designation of a place for holding the Democratic convention, Baltimore being particularly active, and Kansas City, St. Louis and St. Paul being in the running.

**The President's Progress**

The President's special train, bearing, besides Mr. Taft, a score of California officials and many journalists, narrowly escaped destruction early on the morning of October 16. A Southern Pacific Railroad watchman at Gaviota discovered two men on a non union bridge at that point, and, when threatened by them, fired upon them. Later he discovered eighteen sticks of dynamite under the bridge, and subsequent search disclosed more dynamite and ten feet of fuse. The plan was to destroy the bridge; whether the death of the President was a part of the conspiracy

is not known.——To his original 13,000 mile itinerary Mr. Taft has decided to add some eighteen days of travel. The addition includes a day in Morgantown, W. Va.; four days at Hot Springs, Va., for a rest; two or three days at his home in Cincinnati; a tour thru Kentucky and Tennessee, and probably a stop in Virginia. This will delay the President's return to Washington nearly three weeks, bringing him to the White House about November 10.——The President told an audience at New Castle, Wyo., last week, that the enforcement of the Sherman Anti-Trust law would be continued, "no matter whether we be damned or not."——At El Paso, Tex., to the four visiting Governors from New Mexico, Arizona, Sonora and Chihuahua, Governor Colquitt, of Texas, proposed that the Governors wire President Taft an endorsement of his administration regardless of politics or sectionalism. The proposal was unanimously agreed to.

**Mr. Fisher on Alaska**

The Secretary of the Interior, Mr. W. L. Fisher, has returned from a 7,000-mile journey to and thru Alaska, and has been interviewed at New York. He said that he was convinced that the final solution of Alaska's problems must lie in action by Congress. Legislation to open the way to the proper development of the Territory is needed. The Secretary said, in part:

"The trouble is that matters are now at a deadlock. The extremists of the conservation party prefer to hunt political advantage by more or less patent demagogy and insist that none of the resources of the Territory shall be thrown open to development. The extremists of the other party, the exploiters, want no control by the Government and the indiscriminate grabbing of everything. Neither wing can be made to yield a particle and it is only the moderate partisans who can be brought together on a platform of constructive legislation. . . . My trip showed me some amusing contradictions. I learned that it is the hardy pioneer who sits at a rosewood desk in Chicago, Detroit or Seattle who cries the loudest against what he calls the exploitation of Alaska by wicked capitalists, and it is the man on the ground up there who wants the resources of the country thrown wide open. He knows more than the hardy pioneer in the States, even if his attitude is just as dangerous to the ultimate welfare of the Territory."

Mr. Fisher declined to discuss the Controller Bay question offhand further than to say that the value of the bay as a harbor had been overestimated. The full resources of Alaska remain unknown, he added. So inadequate are transportation facilities in the new country that great wealth which lies in the interior cannot be reached until such time as the extension of the railroads opens the way. The development of all of the mineral properties depends largely upon a cheap and plentiful coal supply, for water power can be counted on only during the warm season. The discovery of fuel oil at Cordova, which can be transported at cheaper rates than coal, promises to solve the problem of fuel for the Copper River and Northern Railroad, the Alaska Steamship Company and the Bonanza concentrator plant, and the field for fuel oil will doubtless be extended. One of Mr. Fisher's greatest surprises was learning something of Alaska's agricultural possibilities.

"People down here," said the Secretary, "have no idea of the fertility of some of the Alaskan lands in the warm belt along the sea, and there is no doubt that in years to come Alaska will be producing much agricultural wealth."

——The southwestern coast of Alaska was visited again last week by an earthquake which interrupted sluicing mining operations and shook up the glaciers. A cable despatch from Cordova says that the shock was less severe than that of September 22, but it lasted several seconds.

**Grafters**

In the Lorimer hearing, John M. Peffers, formerly secretary to Senator Hopkins, testified that he had reason to believe four legislators at least were bribed to vote for Lorimer. One of these was State Senator McCormick, and the alleged amount was $2,500. McCormick subsequently denied the charges, tho he did change over from Hopkins to Lorimer. State Representative Terrill testified that he had been informed that his vote was worth $1,000 to Lorimer. Edward Hines, Chicago lumber magnate, and alleged treasurer of the Lorimer election fund, was called before the Senate sub-committee in executive session. Ex-State Representative Shephard, a Democrat,

testified that he had voted for Lorimer on condition that a certain enemy of his be ousted from his post office; but Mr. Lorimer had not kept his bargain.——The Senatorial inquiry into the re-election of Senator Stephenson continues, the subcommittee meeting at Milwaukee. Testimony has been given to the effect that $110,000 was raised to be used by Robert J. Shields in the interests of Senator Stephenson during the campaign, this amount being in addition to Mr. Stephenson's large payments.——A clerk in the office of the comptroller of Atlantic City, N. J., and a wealthy merchant of that town have been convicted of conspiracy to pervert election laws at the 1909 elections by buying votes. Other cases will now be put on trial.

**The Panama Canal**

Herman Bolton, an American, arrived at Panama from Guayaquil, on the 11th, and died in the Ancon Hospital on the 17th of bubonic plague. All the necessary precautions were taken as to the passengers on the ship and their baggage, and no additional cases are expected. Jamaica has quarantined vessels from Colon.——Owing to Mr. Taft's disapproval, the project of making a great naval station at Colon has been given up. Colonel Goethals has been instructed to build there a shipyard for docking and repairing merchant vessels, with dry docks, machine shops, etc.——The Canal Commission, in its annual report, urges that legislation concerning canal tolls be enacted without delay, as foreign shipping interests should have at least eighteen months' notice about the rates, which will affect plans for enlarging trade fleets. The commission says ships will pass thru the canal by January 1, 1914, and possibly six months earlier. It recommends that the Government, while supplying coal and oil for its own ships, shall also sell to other ships, and even dock and repair them.——Several steamship companies are enlarging their fleets because of the approaching completion of the canal. The American-Hawaiian Company, now using eighteen ships, has ordered four large freighters for service, by way of the canal, between New York and Honolulu. The Pacific Mail, Ward, Clyde and Mallory lines are to have new ships. The new Atlantic & Pacific Company expects to build fifteen. In Stockholm a company has been formed to build ships for a line to San Francisco, intending to carry California fruit to Sweden. A London company will have a fleet of refrigerating carriers for the Pacific Coast trade. A shipping authority says that fifty new ships will surely be constructed and that orders for fifty more are in sight.——After the close of the annual meeting of the American Bankers' Association in New Orleans, next month, there will be an excursion of bankers to the Canal Zone, and four steamships have been chartered for it.——It is reported that German capitalists are considering negotiations with Costa Rica and Nicaragua for the construction of a canal on the Nicaragua route, but with a cut from the lake to the Pacific at the Sapoa River, in Costa Rica, some distance south of the line originally chosen.

**Cuba and Porto Rico**

At a mass meeting in Havana, the Cuban Veterans' Association angrily protested against the appointment to office, by President Gomez, of Spaniards who fought against the revolutionists. The veterans complained of the presence of Señor Chalons and Señor Martinez-Ortiz in the Cabinet, and threatened to lynch every Spanish officeholder in the country. A thousand of them, led by General Loynaz del Castillo and Colonel Aranda, marched to the palace, presented resolutions of protest and repeated the threats. President Gomez declined to be guided by the complainants. Two days later, on the 21st, Señor Chalons, Secretary of Public Works, tendered his resignation, but the President refused to accept it. A majority of the army officers and of the police are members of the Veterans' Association.——It is reported that not long before the destruction of the "Maine," an officer of the Dittmar Powder Company, in this country, sold to an agent of General Weyler 5,000 pounds of dynamite, 250 exploders, a large quantity of insulated wire and a battery which could be used in exploding a mine; also, that a part of the wire was recently discovered in the vicinity of the wreck. The story is told with

only details and names, but full confirmation is lacking.

**The Philippine Islands**

At the opening of the session of the Philippine Assembly, on the 16th, the delegates declared that they intended to lay aside politics and to make work for independence secondary to a movement for industrial development.——At the Lake Mohonk Conference, on the 20th, Dr. Heiser, the Philippine Director of Health, spoke at length of the efforts of our Government to promote sanitation and reduce the death rate in the islands. At the beginning more than 6,000,000 Filipinos were vaccinated. In Manila and the neighboring districts, where formerly the annual number of deaths from smallpox was about 6,000, there was not one death from this disease last year. Manila's supply of polluted water has been displaced by a pure supply from an uninhabited watershed, and sewers have been built. There has been reform in the methods of burying the dead. Great advances have been made in prison sanitation, and the death rate in prisons has been reduced to a normal percentage. Under Spanish rule nearly all of the 5,000 lepers were at large; 4,000 of them are now collected in an island colony. Hygiene is taught in 3,500 public schools. Edward S. Bruce, of Manila, said only 10 per cent. of the people were fitted for self-government.

**The Situation in Mexico**

José Pino Suarez was elected Vice-President. In a nearly complete list of electoral votes he had 8,238, De la Barra 4,956, and Dr. Francisco Gomez 2,606. It is expected that Suarez will not enter the Cabinet, but will continue to be Governor of Yucatan. The inauguration will take place on or about November 15, and immediately thereafter De la Barra will go to Europe. The new Government will encourage the States to promote the construction of railways thru undeveloped parts of the country. Jalisco is guaranteeing the bonds of a French company for a line of 250 miles from Guadalajara to the Pacific. An English syndicate will build a road from Zacatecas to the Bolanos mining district. The National Railways Company is making five branches, in all about 350 miles. Madero's attitude toward the Pearson oil concessions and monopolistic combinations is defined in a letter:

"Replying to your letter relative to the petroleum interest of our country, my recent declarations to Lord Cowdray were limited to an assurance that if said concessions had been granted in conformity with the law, and if the concessionnaire had complied with all the obligations thereof, the new Government would respect them. I added that I would oppose the formation in Mexico of all kinds of monopolies or combinations tending to limit competition in trade."

Madero, on the 21st, was cheered as he addressed the prisoners in the penitentiary at Monterey, where, a little more than a year ago, he was imprisoned in a cell for opposing the rule of Diaz. The Government, upon statements made by Madero and others, paid the expenses of the revolution. Señor Granados, Minister of the Interior, and Ernesto Madero, Minister of Finance, reported to Congress that $320,000 had been paid, the leading items being as follows: Arms and ammunition, $154,000; lawyers' fees, $53,000; railroad fares, $56,000; revolutionary juntas or agencies at Washington, San Antonio and El Paso, $39,000; newspapers, $12,000.——Hostilities continue in the extreme southern States of Chiapas and Yucatan. In a battle at Chiapache more than 100 were killed by the Federal troops; at Copaonala the Federals captured the town after a five hours' fight; at Concordia they took the town and then destroyed it by fire. There were reports that the revolts in the south were in the interest of Reyes, and that he had the aid of President Cabrera, of Guatemala, who was supplying rifles. Arms had been landed, it was said, on the Yucatan coast. A small uprising in Tabasco was also ascribed to the influence of Reyes. He said he was only a spectator, adding that the discontent was due to lack of liberty at the election. Zapata's army in Morelos has not been subdued. A story was published that in a battle on the 16th, 7 miles from Cuernavaca, his forces were cut to pieces and 200 of his men killed, the Federal loss exceeding 100. But a later official report showed that Zapata lost only twenty-one men, and that the Federal casualties were inconsiderable.

**Central and South America**

There is reported to be much unrest in Guatemala, because of the broad concessions recently granted to Americans, who have obtained exclusive privileges for mining and exploration in all parts of the country.——From Cuba comes a story that Zelaya, the deposed President of Nicaragua, has sent arms to Ecuador, where they are to remain until he shall need them in a movement against the Nicaraguan Government; also, that he has the aid of those whose concessions (granted by himself) have been annulled by Nicaragua's present rulers.——To the increased price of coffee is ascribed the presence at Cornell University of fifteen young men from Brazil. Last year there were only two. Nearly all of these young men, sons of coffee planters, are taking the course in engineering.——There is some speculation at Lima about the fact that 12,000 Chilean troops and 18,000 soldiers of Bolivia's army are at the same time practising maneuvers on land adjacent to Peru's frontier.——It is reported in Buenos Ayres that an American corporation intends to buy the entire Argentine crop of linseed, and has already bought one-sixth of it, or 100,000 tons. ——A recent municipal census shows that Buenos Ayres has a population of 1,314,163, being the largest of the Latin-American cities. Our consul-general there says that 4,836 ships entered that port last year, and that only three of them were ships of the United States.

**Canada**

The Canadian census figures are a great disappointment to patriots. The total population, 7,081,869, is a million under what was expected. In 1901 the population was 5,371,315. The population of certain cities and their gains are as follows:

| | | |
|---|---|---|
| Montreal | 466,197 | 198,467 |
| Quebec | 78,067 | 9,227 |
| Toronto | 256,240 | 167,206 |
| Winnipeg | 136,430 | 93,090 |
| Vancouver | 106,333 | 73,323 |
| Victoria | 31,660 | 10,084 |
| Edmonton | 24,372 | 22,256 |
| Regina | 30,210 | 27,761 |
| Saskatoon | 12,002 | 11,839 |
| Moose Jaw | 13,824 | 11,766 |
| Ottawa | 86,340 | 41,112 |

The parliamentary representation of the West will now be increased; that of the East reduced. The basis of representation will henceforth be one seat to 30,000 population, instead of 25,000. Even so, 11 new seats will be added, bringing the membership of the Dominion Parliament up to 232.

**British Labor Problems**

The Royal Commission which was appointed in August to recommend reforms in the arbitration laws has made its report. The great railroad strike was ended, or at least suspended, by the promise of the appointment of the commission, which has ever since been occupied by taking evidence. The report of the commission, however, altho unanimous and signed by Arthur Henderson, ex-chairman of the Parliamentary Labor party, and John Burnett, labor representative of the Board of Trade, is so far from meeting the demands of the men that instead of pacifying them it may serve as the signal for another and more serious strike. The aim of the railroad strike of last summer, in so far as it had a definite aim, was to compel the companies to conduct all negotiations with their employees thru the officials of the trades unions, but on this point the commission has come to the conclusion "that with their great responsibilities the companies cannot and should not be expected to permit any intervention between them and their men on the subjects of discipline and management." The men are, however, permitted to appoint a "secretary-advocate" to represent them upon the conciliation boards, and he may be a union officer. It is proposed that the new scheme remain in force until January 6, 1914. All questions affecting the hours of work, wages and conditions of service that cannot be settled by negotiation shall be referred to a sectional board of conciliation, whose decisions are to be final and remain in force for a year. The central boards, the appeal to which was the chief cause of delay under the old scheme, are to be abolished. Differences as to the interpretation of the settlements are to be decided by the chairman of the board. Questions as to the interpretation of the plan are to be settled by the Board of Trade. The conciliation boards may select their own chairman, but if they

cannot agree the Board of Trade is to appoint one from a panel prepared for that purpose. The report condemns strikes until all available conciliation machinery is proved futile and recommends that the strikers shall not be permitted to incite or coerce the men who wish to remain at work by threats or any form of intimidation. The officials of the Amalgamated Society of Railway Servants declare that the report will not meet the approval of the railway men.——Mr. Lloyd-George will have difficulty in being able to carry out his promise that the Insurance Bill will be passed before the end of the year. Vigorous protests have been made against the bill by the physicians, friendly societies and other classes. The scope of the bill is so great, since it provides for the insurance against sickness and disability of about 14,700,000 working men and women, and the interests involved are so diverse that altho all parties agree to the principle of the bill it will be difficult to harmonize them on details. The second section of the bill, insuring workingmen against unemployment, provides still more contentious material. But Mr. Ramsey MacDonald, leader of the Laborites in the House of Commons, has pledged the support of his party to the bill, and it is likely to be passed in some form or other. It is assumed that the leaders of the Government and Opposition have agreed that no political crisis shall be precipitated during the King's absence in India.——The energetic protest made by the aged Lord Halsbury against the acquiescence of the leaders to the passage of the Parliamentary Bill has resulted in the organization of a Halsbury Club, composed of Unionist members from both Houses of Parliament,

"for the purpose of concentrating the energy and securing the cooperation of all their fellow-citizens who intend to restore a free Constitution to the United Kingdom and insist on the revival and maintenance of principles which they hold to be vital to national and imperial existence."

**The Occupation of Tripoli**

The Italians are meeting with a more stubborn resistance from the smaller towns on the Tripolitan coast than from the capital. Khoms (Lebda), a town of 3,500 people, about sixty miles east of the city of Tripoli, surrendered after a few shots, but in the capture of Derna and Bengazi in Cyreniaca, or Barca, further to the eastward, the Italian troops suffered serious losses, the extent of which, however, has not been officially disclosed. Derna, which was captured in 1805 by the American General William Eaton in his attempt to overthrow the Pasha of Tripoli, is now a town of only about 4,000 inhabitants. Early in the week an Italian squadron, composed of five warships, three destroyers and a transport carrying a battalion of infantry, appeared and drew up in a semicircle before the town. When summoned to surrender the Turkish commander refused and demanded, on his part, the withdrawal of the Italian squadron. A deputation of Arabs from Derna, however, went on board the flagship to beg the Vice-Admiral not to bombard the town. They professed friendship for the Italians, and said that the Turkish garrison consisted of only a hundred men with two guns. The battleship "Napoli" opened the bombardment with a few shells, destroying the earthworks along the shore. At noon the cruiser "Pisa" destroyed the barracks and then lowered a pinnace for the purpose of making a landing, but this was fired upon by the Turks. Then the whole squadron opened fire on the fortifications, and in the afternoon the bombardment was repeated. Nine pinnaces were then sent ashore under fire of the Turks, who did not cease their resistance until the magazine was blown up. In the attack on Bengazi, a town of about 20,000 inhabitants, four battleships, four cruisers, three destroyers and two flotillas of torpedo boats took part. The Turkish commander having refused to surrender when the squadron arrived on October 18, the bombardment began at six o'clock in the morning and continued until dark. Late in the afternoon a detachment of sailors and soldiers effected a landing on the beach in the face of a sharp rifle fire. They held their position until reinforcements had raised their number to 4,000, then carried by night assault the barracks in the village of Sidi Hassein. On the following day Bengazi was occupied. In this case the Arabs joined with the Turks in the defense.——The new Grand

Vizier, Said Pasha, in his address to the Turkish Parliament, said that the replies received from the Powers in regard to mediation were more favorable than was generally believed, as would be seen later. The Government had abstained from reprisals against the Italians in Turkey, because it wished a heavy indemnity, such as France had to pay to Germany. The policy of the Government was to combine passive resistance with diplomatic efforts. He opposed the cession of Tripoli for a monetary consideration. On hearing his statement the Chamber of Deputies by a vote of 125 to 60 exprest its confidence in the Government to safeguard effectively the sovereign rights of the Sultan in Tripoli and the integrity of the Empire. It was moved by the Tripolitan Deputies that the Chamber impeach the ex-Vizier, Hakki Pasha, and his Cabinet for having weakened the garrison at Tripoli by the removal of men and arms. It is persistently asserted and repeatedly denied that Turkey is to be admitted to the Triple Alliance on terms of equality with Germany, Austria and Italy. It is also rumored that Italy intends to occupy Lesbos and other islands in the Ægean Sea unless Turkey promptly consents to the annexation of Tripoli.

*

**The Chinese Rebellion**

The revolutionists have held their own during the week and seem to be gaining in popularity in the country generally. They have complete possession of the three cities at the junction of the Yang-tse River with the Han River, Wu-chang, Han-kow and Han-yang. Altogether, these cities have a population of about a million and a half and form the most important commercial and manufacturing center of the Chinese Empire. The Yang-tse at this point is 1,400 feet wide, and being more than 40 feet deep, is navigable for the largest ocean vessels. The city of I-chang, about 400 miles further up the Yang-tse, and Chang-sha, to the southward, have declared for the revolution, and risings in the cities on the lower Yang-tse are likely to occur shortly. But so far the successes of the revolutionists have been confined to the immediate vicinity of Wu-chang. The fighting near Han-kow on the 17th and 18th, which was reported from Peking as a Government victory, turns out to have been quite the reverse. The insurgent forces did indeed withdraw on the first day after a short conflict, but this was because of a failure of their supply of ammunition. The next morning they again crossed the river with 5,000 men, but found the imperialist camp deserted, for the troops had retreated seven miles further up the railroad to the north. The imperialist naval force in the river, consisting of three cruisers, three gunboats and three torpedo boats, took part in the engagement, but their aim was so poor that they did no damage except to set fire to buildings with their shells. Afterward Admiral Sah withdrew his vessels several miles down the river, out of danger, because, it is said, he feared that the crews would mutiny and go over to the revolutionists. A Red Cross corps was extemporized by foreign nurses and physicians, and many of the wounded cared for in the mission hospitals. The river station fell into the hands of revolutionists, and they apparently control the southern section of the Peking and Han-kow Railroad as far north as the mountains which form the boundary between the Ho-nan and Hu-peh provinces. If they can hold the passes thru this range the imperialist troops from Peking will find it difficult to enter the Yang-tse Valley. The Minister of War, General Yin Chang, has established his headquarters at Sin-yang-chow, north of the mountains, about 100 miles from Han-kow, and is reported to have 20,000 troops under his command. He is not, however, attempting an advance upon the enemy, and Yuan Shi-kai, to whom has been entrusted the task of putting down the rebellion, calls him "boastful and incapable." Yuan Shi-kai is understood to have accepted the position of Viceroy of Hu-peh and Hu-nan, the revolted provinces, on condition that he be allowed to organize his own army of 10,000 men, and that $2,000,000 be appropriated for his use; also that he be empowered to offer constitutional concessions to the rebels. He is said to

force the opening of parliament next year instead of in 1913, as promised, and the appointment of a responsible Cabinet composed exclusively of Chinese instead of Manchus. Yuan Shi-kai, however, appears reluctant to take an active part against the revolutionists, excusing himself on the ground that he is still suffering from the rheumatism which the edict of 1908 gave as the reason for his dismissal from the post of commander-in-chief. Every day it has been reported from Peking that he was about to start for the front, but he has not yet done so.——The Senate, or preliminary national assembly, met on October 22, and took a decided stand in opposition to the imperial Government. Resolutions will be introduced calling for the dismissal of Sheng-Hsuan-huai, Minister of Posts and Communications, who negotiated the foreign loans for railroads, and demanding the release of the president and vice-president of the Provincial Assembly in Sze-chuan, who were imprisoned by the Viceroy because of their opposition to foreign railroad construction. The Government asked for a loan of $3,000,000 for military purposes from the English, German, French and American capitalists who were to furnish the $50,000,000 railroad loan, but they refused to provide the money. A request has also been sent to the Powers that the imperial Government be allowed to suspend the monthly payments of the Boxer indemnity of $333,000,000 during the disorders. Government bank notes are either refused or accepted at a discount of 20 per cent. or more. Runs are made upon native and foreign banks, and many failures are reported. There are twelve vessels of the American navy, under the command of Rear-Admiral Murdock, in the Yang-tse River or at Shanghai—three cruisers, two destroyers, five gunboats, one transport and one collier.

AMERICANS DEPARTING FROM THE HAN-KOW RAILROAD STATION NOW IN THE HANDS OF THE REVOLUTIONISTS

# The Social Value of the Telephone

BY HERBERT N. CASSON

[Our readers will remember Mr. Casson, who has been a frequent contributor to THE INDEPENDENT in recent years. Since writing the history of the steel business, he has made a special study of the telephone.—EDITOR.]

WHAT we might call the telephonization of city life, for lack of a simpler word, has remarkably altered our manner of living from what it was in the days of Abraham Lincoln. It has enabled us to be more social and co-operative. It has literally abolished the isolation of the separate family. It has become so truly an organ of the social body that we now enter into contracts by telephone, give evidence, try lawsuits, make speeches, propose marriage, confer degrees, appeal to voters, and do almost everything else that is a matter of speech.

In stores and hotels this wire traffic has grown to an almost bewildering extent. The one hundred largest hotels in New York City have 21,000 telephones —nearly as many as the continent of Africa and more than the kingdom of Spain. In an average year they send 6,000,000 messages. The Waldorf-Astoria alone tops all residential buildings with 1,120 telephones and 500,000 calls a year; while merely the Christmas Eve orders that flash into Marshall Field's store, or John Wanamaker's, have risen as high as 3,000.

Whether the telephone concentrates population or scatters it is a question that has not yet been examined. It is certainly true that it has made the skyscraper possible, and thus helped to create an absolutely new type of city, that was never imagined even in the fairy tales of ancient nations. The skyscraper is ten years younger than the telephone. It is now generally admitted to be the ideal building for business offices. It is one of the few types of architecture that may fairly be called American. And its efficiency is largely, if not mainly, due to the fact that its inhabitants may run errands by telephone as well as by elevator.

There seems to be no activity which is not being made more convenient by the telephone. It is used to call the duck-shooters in Western Canada when a flock of birds has arrived, and to direct the movements of the Dragon in Wagner's grand opera "Siegfried." At the last Yale-Harvard football game it conveyed the almost instantaneous news to 50,000 people in various parts of New England. At the Vanderbilt Cup race its wires girdled the track and reported every gain or mishap of the racing autos. And at such extensive pageants as that of the Quebec Tercentenary, in 1908, where 4,000 actors came and went upon a 10-acre stage, every order was given by a telephone.

Public officials, even in the United States, have been slow to change from the old-fashioned and more dignified use of written documents and uniformed messengers; but in the last ten years there has been a sweeping revolution in this respect. Government by telephone! This is the new idea that has already arrived in the more efficient departments of the Federal service. And as for the present Congress, that body has gone so far as to plan for a special system of its own, in both Houses, so that all official announcements may be heard by wire.

Garfield was the first among American Presidents to possess a telephone. An exhibition instrument was placed in his house, without cost, in 1878, while he was still a member of Congress. Neither Cleveland nor Harrison, for temperamental reasons, used the magic wire very often. In their time, there was one lonely, idle telephone in the White House, used by the servants several times a week. But with McKinley came a new order of things. To him a telephone was more than a necessity. It was a pastime—an exhilarating sport. He was the one President who really reveled in the comforts of telephony. In

1895 he had sat in his Canton home and heard the cheers of the Chicago Convention. Later he sat there and ran the first Presidential telephone campaign—talked to his managers in thirty-eight States. Thus he came to regard the telephone with a higher degree of appreciation than any of his predecessors, and eulogized it on many public occasions. "It is bringing us all closer together," was his favorite phrase.

To Roosevelt the telephone was mainly for emergencies. He used it to the full during the Chicago Convention of 1907 and the Peace Conference at Portsmouth. But with Taft the telephone became again the common avenue of conversation. He introduced at least one new telephonic custom—a long distance talk with his family every evening when he is away from home. Instead of the solitary telephone of Cleveland-Harrison days, the White House has now a branch exchange of its own—"Main 6,"—with a sheaf of wires that branch out into every room as well as to the nearest central.

Next to public officials, bankers were perhaps the last to accept the facilities of the telephone. They were slow to abandon the old fallacy that no business can be done without a written record. James Stillman, of New York, was first among bankers to foresee the telephone era. As early as 1875, while Bell was teaching his infant telephone to talk, Stillman risked $2,000 in a scheme to establish a crude dial system of wire communication, which later grew into New York's first telephone exchange. At the present time the banker who works closest to his telephone is probably George W. Perkins, of the J. P. Morgan group of bankers. "He is the only man," says Morgan, "who can raise twenty millions in twenty minutes." The Perkins plan of rapid transit telephony is to prepare a list of names, from ten to thirty, and to flash from one to another as fast as the operator can ring

IN STORES THE TELEPHONE SERVICE IS BEWILDERINGLY COMPLETE

them up. Recently one of the other members of the Morgan bank proposed to enlarge its telephone equipment. "What will we gain by more wires?" asked the operator. "If we were to put in a 600-pair cable, Mr. Perkins would keep it busy."

The most brilliant feat of the telephone in the financial world was done during the panic of 1907. At the hight of the storm, on a Saturday evening, the New York bankers met in an almost desperate conference. They decided, as an emergency measure of self-protection, not to ship cash to Western banks. At midnight they telephoned this decision to the bankers of Chicago and St. Louis. These men, in turn, conferred by telephone, and on Sunday afternoon called up the bankers of neighboring States. And so the news went from 'phone to 'phone, until by Monday morning all bankers and chief depositors were aware of the situation, and prepared for the team play that prevented any general disaster.

As for stockbrokers of the Wall Street species, they transact practically all of their business by telephone. In their Stock Exchange stand 641 booths, each one the terminus of a private wire. A firm of brokers will count it an ordinary year's talking to send 50,000 messages, and there is one firm which last year sent twice as many. Of all brokers, the one who finally accomplished most by telephony was unquestionably E. H. Harriman. In the mansion that he built at Arden there were a hundred telephones, with sixty of them linked to the long-distance lines. What the brush is to the artist, what the chisel is to the sculptor, the telephone was to Harriman. He built his fortune with it. It was in his library—his bathroom—his private car—his camp in the Oregon wilderness. No transaction was too large or too involved to be settled over its wires. He saved the credit of the Erie by telephone—lent it $5,000,000 as he lay at home on a sick bed. "He is a slave to the telephone," wrote a magazine editor. "Nonsense," replied Harriman; "it is a slave to me."

The telephone arrived in time to prevent big corporations from being unwieldy and aristocratic. The foreman

WITH MR. TAFT THE TELEPHONE IS THE COMMON AVENUE OF CONVERSATION

of a Pittsburgh coal company may now stand in his subterranean office and talk to the president of the Steel Trust, who sits on the twenty-first floor of a New York skyscraper. The long-distance talks, especially, have grown to be indispensable to the corporations whose plants are scattered and geographically misplaced—to the mills of New England, for instance, that use the cotton of the South and sell so much of their product to the Middle West. To the companies that sell perishable commodities, an instantaneous conversation with a buyer in a distant city has often saved a carload or a cargo. Such caterers as the meat packers, who were among the first to realize what Bell had made possible, have greatly accelerated the wheels of their business by inter-city conversations. For ten years or longer the Cudahys have talked every business morning between Omaha and Boston, via 1,570 miles of wire.

In the refining of oil, the Standard Oil Company alone, at its New York office, sends 230,000 messages a year. In the making of steel, a chemical analysis is

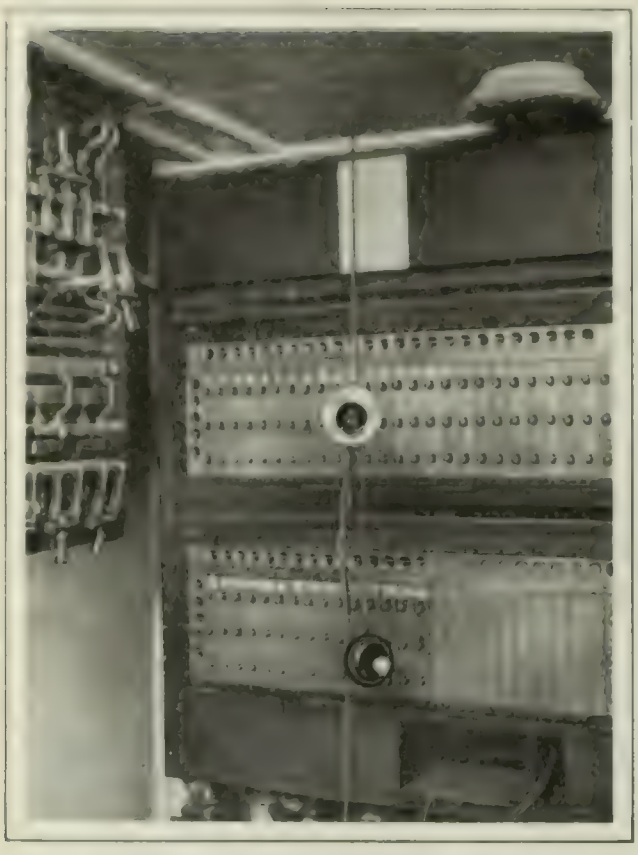
made of each caldron of molten pig iron when it starts on its way to be refined, and this analysis is sent by telephone to the steelmaker, so that he will know exactly how each pottul is to be handled. In the floating of logs down rivers, instead of having relays of shouters to prevent the logs from jamming, there is now a wire along the bank, with a telephone linked on at every point of danger. In the rearing of skyscrapers it is now usual to have a temporary wire strung vertically, so that the architect may stand on the ground and confer with a foreman who sits astride of a naked girder 300 feet up in the air.

The first steamship line to use the telephone was the Clyde, which had a wire from their dock to the office in 1877; and the first railway was the Pennsylvania, which two years later was persuaded by Professor Bell himself to give it a trial in Altoona. Since then this railroad has become the chief beneficiary of the art of telephony. It has 175 exchanges, 400 operators, 13,000 telephones and 20,000 miles of wire—a more ample system than the city of New York had in 1896.

In the operation of trains the railroads have waited thirty years before they dared to trust the telephone, just as they waited fifteen years before they dared to trust the telegraph. In 1883 a few railways used the telephone in a small way, but in 1907, when a law was passed that made telegraphers highly expensive, there was a general swing to the telephone. Several dozen roads have now put it in use, some employing it as an associate of the Morse method and others as a complete substitute. It has already been found to be the quickest way of dispatching trains. It will do in five minutes what the telegraph did in ten. And it has enabled railroads to hire more suitable men for the smaller offices.

In news gathering, too, much more than in railroading, the day of the telephone has arrived. The Boston *Globe* was the first paper to receive news by telephone. Later came the Washington *Star*, which had a wire strung to the Capitol, and thereby gained an hour over

IN THE NEW YORK STOCK EXCHANGE THERE ARE OVER SIX HUNDRED PRIVATE WIRES



THE TELEPHONE ON A PENNSYLVANIA LIMITED TRAIN

its competitors. Today the evening papers receive most of their news over the wire. This has resulted in a specialization of reporters—one man runs for the news and another man writes it. Some of the runners never come to the office. They receive their assignments by telephone and their salary by mail. There are even a few who are allowed to telephone their news directly to a swift linotype operator, who clicks it into type on his machine without the scratch of pencil. This, of course, is the ideal method of news-gathering, which is rarely possible.

A paper of the first class, such as the New York *World*, has now an outfit of twenty trunk lines and eighty telephones. Its outgoing calls are 200,000 a year and its incoming calls 300,000, which means that for every morning, evening and Sunday edition there has been an average of 750 messages. The ordinary newspaper in a small town cannot afford such a service, but recently the United Press has originated a co-operative method. It telephones the news over one wire to ten or twelve papers at the same time. In ten minutes a thousand words can in this way be flung out to a dozen towns, as quickly as by telegraph and much more cheaply.

But it is in a dangerous crisis, when safety seems to hang upon a second, that the telephone is at its best. It is the instrument of emergencies—a sort of ubiquitous watchman. When a girl operator in the exchange hears a cry for help—"Quick! The hospital!" "The fire department!" "The police!" she seldom waits to hear the number. She knows it. She is trained to save half seconds. And it is at such moments, if ever, that the users of a telephone can appreciate its insurance value. No doubt, if a King Richard III were worsted on a modern battlefield, his instinctive cry would be—"My kingdom for a telephone!"

When instant action is needed in the city of New York, a general alarm can in five minutes be sent by the police

THE WARSHIP, TOO, HAS ITS CENTRAL
Aboard U. S. S. "Rhode Island"

wires over its whole vast area of 300 square miles. When, recently, a gas main broke in Brooklyn, sixty girls were at once called to the centrals in that part of the city to warn the 10,000 families who had been placed in danger. When the ill-fated "General Slocum" caught fire, a mechanic in a factory on the waterfront saw the blaze and had the presence of mind to telephone the newspapers, the hospitals and the police. When a small child is lost, or a convict has escaped from prison, or the forest is on fire, or some menace from the weather is at hand, the telephone gives the news. In one tragic case, the operator in Folsom, N. M., refused to quit her post until she had warned her people of a flood that had broken loose in the hills above the village. Because of her courage nearly all were saved, tho she herself was drowned at the switchboard.

If the disaster cannot be prevented, it is the telephone, usually, that brings first aid to the injured. After the destruction of San Francisco, Governor Guild, of Massachusetts, sent an appeal for the stricken city to the 354 mayors of his State, and by the courtesy of the Bell company, which carried the messages free, they were delivered to the last and furthermost mayors in less than five hours. After the destruction of Messina, an order for enough lumber to build 10,000 new houses was cabled to New York and telephoned to Western lumbermen. So quickly was this order filled that on the twelfth day after the arrival of the cablegram, the ships were on their way to Messina with the lumber. After the Kansas City flood of 1903, when the drenched city was without railways or street cars or electric lights, it was the telephone that held the city together and brought help to the danger spots. And after the Baltimore fire, the telephone exchange was the last to quit and the first to recover. Its girls sat on their stools at the switchboard until the window panes were broken by the heat. Then they pulled the covers over the board and walked out. Two hours later the building was in ashes. Three hours later another building was rented on the unburned rim of the city and the wire chiefs were at work. In one day there was a system of wires for the use of the city officials. In two days these were linked to long-distance wires; and in eleven days a 2,000-line switchboard was in full working trim. This feat still stands as the record in rebuilding.

In the supreme emergency of war, the telephone is as indispensable, very nearly, as the cannon. This, at least, is the belief of the Japanese, who handled their armies by telephone when they drove back the Russians. Each body of Japanese troops moved forward like a silkworm, leaving behind it a glistening strand of red copper wire. At the decisive battle of Mukden, the silkworm army, with a million legs, crept against the Russian hosts in a vast crescent, a hundred miles from end to end. By means of this glistening red wire, the various batteries and regiments were organized into fifteen divisions. Each group of three divisions was wired to a general, and the five generals were wired to the great Oyama himself, who sat ten miles back of the firing line and sent his orders. Whenever a regiment lunged forward, one of the soldiers carried a telephone set. If they held their posi-

tion, two other soldiers ran up with a spool of wire. In this way and under fire of the Russian cannon, 150 miles of wire were strung across the battlefield. As the Japanese said, it was this "flying telephone" that enabled Oyama to manipulate his forces as handily as tho he were playing a game of chess. It was in this war, too, that the Mikado's soldiers strung the costliest of all telephone lines, at 203 Metre Hill. When the wire had been basted up this hill to the summit, the fortress of Port Arthur lay at their mercy. But the climb had cost them 24,000 lives..

Of the seven million telephones in the United States, about two million are in farmhouses. Every fourth American farmer is in telephonic touch with his neighbors and the market. Iowa leads among the farming States. Not to have a telephone, in Iowa, is to belong to what a Londoner would call the "submerged tenth" of the population. Second in line comes Illinois, with Kansas, Nebraska and Indiana following closely behind; and at the foot of the list, in the matter of farm telephones, are Connecticut and Louisiana.

The first farmer who discovered the value of the telephone was the market gardener. Next came the bonanza farmer of the Red River Valley—such a man, for instance, as Oliver Dalrymple, of North Dakota, who found that by the aid of the telephone he could plant and harvest 30,000 acres of wheat in a single season. Then, not more than half a dozen years ago, there arose a veritable *Telephone Crusade* among the farmers of the Middle West. Cheap telephones, that were fairly good, had by this time been made possible by the improvements of the Bell engineers; and stories of what could be done by telephone became the favorite gossip of the

THE SWITCHBOARD AT THE NEW YORK POLICE HEADQUARTERS

day. One farmer had kept his barn from being burned down by telephoning for his neighbors. Another had cleared $600 of extra profit on the sale of his cattle by telephoning to the best market. A third had rescued a flock of sheep by sending quick news of an approaching blizzard. A fourth had saved his son's life by getting an instantaneous message to the doctor, and so on.

How the telephone saved a $3,000,000 fruit crop in Colorado, in 1909, is the story that is oftenest told in the West. Until that year, the frosts in the spring nipped the buds. No farmer could be sure of his harvest. But in 1909 the fruit-growers bought smudge-pots — 300,000 or more. These were placed in the orchards, ready to be lit at a moment's notice. Next, an alliance was made with the United States Weather Bureau, so that whenever the Frost King came down from the north, a warning could be telephoned to the farmers. Just when Colorado was pink with apple blossoms, the first warning came: "Get ready to light up your smudge-pots in half an hour." Then the farmers telephoned to the nearest towns: "Frost is coming; come and help us in the orchards." Hundreds of men rushed out into the country on horseback and in wagons. In half an hour the last warning came: "Light up; the thermometer registers 29." The smudge pot artillery was set ablaze and kept blazing until the news came that the icy forces had retreated. And in this way every Colorado farmer who had a telephone saved his fruit.

# Queen's Lace

BY ELEANOR DUNCAN WOOD

Adown the shining meadows
They twain have wandered wide,
And she plucked the vagrant blossoms
That nodded at her side,
And in her eyes was laughter,
And on her lips was pride.

"Nay, nay, my lowly lover,
A village maid I be,
But the scepter of a lordly land
Is humbly proffered me,
And the filmy laces of a queen
Shall deck me royally."

Low sank his head in dolor.
He had nor lands, nor gold,
But strong brown hands to serve and guard
And a steadfast heart to hold,
And—ah, the witchery of her smile
Had made him overbold

The flowers swayed to meet her,
The fair sky bent above.
Low came her voice, and sweeter
Than call of mating dove.
And on her lips was laughter,
But in her eyes was love.

"My scepter is the golden rod,
Look up, beloved, and see,
And the Queen's lace blossoms on my
breast
Deck me right royally;
For the kingdom of your faithful heart
Is realm enough for me."

Maysville, Ky.

# Trustees and Professors

BY THADDEUS P. THOMAS, Ph.D.

[In our issue of September 28, 1911, we printed an article by Professor Thomas, entitled "Some Rights of College Students." This second article is a logical sequel. The author is Professor of Economics and Sociology at Goucher College.—EDITOR.]

"*NO professors admitted without muzzles!*" This is the notice which might be posted in front of a number of our colleges and universities. That number was increased during the past year. Every college that has adopted the muzzle policy has made its professors either subservient cowards if they have remained, or martyrs to the cause of free speech, if they have been forced to resign.

Why call them martyrs? Because a person who "suffers for a principle" is a martyr, tho it must be confessed that these modern martyrdoms, which involve, at their worst, only semi-starvation, are gentle and bloodless affairs compared with those which used to redden the sands of the arena. This modern gentleness is fortunate for the martyr but unfortunate for the truth. When persecution was public and violent, the blood of the martyrs was the seed of the Church. Truth, crushed to earth, will rise again, if it is publicly crushed. But truth, secretly chloroformed, has a harder time of it. A decade or two ago, before the gentler methods of martyrdom had reached their present high degree of efficiency, professors were gotten rid of almost openly. And in backward States, like Florida, where such dead issues as slavery and secession are considered vital topics of the day, the old-fashioned, awkward, public methods are still used to secure uniformity of opinion on these topics. But the up-to-date martyrdom is a marvel of clandestine dexterity. Subtle but irresistible influences are manipulated so as to make the professor move in a seemingly voluntary manner from the professorial chair to the door and thence into the street, never to return. He can guess why, but he can prove nothing.

Do the facts get into the papers? It can usually be so managed that they do not; but if they do, the great, honest, sleepy-headed public is likely to yawn and say, "Another teacher has lost his job, but why should it concern me?" And it is true that the purely personal sufferings of a professor ought not to be a matter of more concern than the equal sufferings of a janitor or a street-cleaner. The fate of the professor is relatively unimportant, even to the professor, if he has the spirit which a number of them have displayed. What is the fate of the truth? That is the important question. What happens if the professors who retain their positions cease to teach advanced social doctrines for fear of the trustees? It is the object of this article to state the rights of trustees, then that of professors, and, finally, to indicate that the teaching of those social truths which some men are desperately eager to suppress is a matter which concerns every member of society, from the smart set to the slums.

The trustees have a right, in the first place, to require the professor to give the students an opportunity to study both sides of social questions and to form and express their own opinions. Students can no more attain judicial-mindedness by proxy than they can attain muscular development by proxy. Let the children of the capitalist and of the trade unionist first study the question, then speak their minds, and learn by actual practice the lesson of toleration, if they are capable of learning it. And let the professor practise toleration toward those students who antagonize his views. He can show high devotion to freedom of speech by allowing it to be used against himself, when he could keep a monopoly of it. Professor Ross, himself a martyr to the cause of free speech, has exprest this noble ideal: "The genuine teacher wants fellows, not disciples, and his happiest hour is when

he finds the cub he has trained is now able to hold him at bay."

Again, the trustees have a right to require the professor to devote most of his time in the classroom to the generally accepted facts and principles of his specialty. As an example of the way in which this right of the trustees may be violated, let us imagine the case of a professor of economics who believes in the Single Tax. Now perhaps the majority of economists recognize that there is much truth in this idea. But if this particular professor believes that the Single Tax doctrine is the central truth in economics, that private property in land is morally wrong, that no other taxes than land taxes are ever justifiable, and if he devotes the greater portion of the time allotted for the teaching of all branches of economics to the exploitation of his favorite doctrine, so that a true view of the science is lost by distorted perspective, and the professor's platform becomes a vantage ground for the promulgation of an exclusive hobby, would not the trustees feel justified in thinking that the professor is obtaining his salary under false pretenses? He certainly has a right to express views in the classroom at variance with those of the majority of economists, but he has no right to teach such views as the science of economics.

Again, the trustees have a right to expect that the professor shall remember, in public utterance outside of the classroom, that he is not only a citizen, but a part of an institution whose good name he can injure by careless and reckless statements. These statements may have wide circulation, not because they come from Mr. Smith, but from *Professor* Smith, who holds the chair of economics in the State university, and it is the importance of the chair rather than his own importance which attracts attention. Now, it is impossible to draw a definite boundary line between the rights of Mr. Smith, the man, and Professor Smith, the economist, but the trustees have a right to expect that the latter shall bear in mind that he is to some extent the custodian of the good name of the university. Consequently his freedom of speech is not absolute.

And what are the rights of the professors? The first of these is the right to freedom of speech inside of the classroom. The professor who has granted freedom of speech to the students could, in the majority of cases, successfully claim it for himself. If the trustees should hold views which are at variance with those of the professor, he could say, "The students have been required to read the best arguments on your side of the question as well as on the other side. What more can you reasonably ask? When I express my own opinion I am only exercising the same privilege that belongs to the humblest and most ignorant student in my class." If the professor, from pocketbook considerations, hesitates to claim this privilege, he should be despised as a coward. If the trustees dismiss the professor for claiming the same right that he freely accords to the student, they should be denounced as tyrants. The fact that they are within their legal rights does not excuse them for wilfully trampling on the moral rights of others.

Another right of the professor is the right to freedom of speech outside of the classroom. This right is limited, as has already been said, by the fact that he is partly responsible for the good name of the educational institution which he represents. But that does not alter his right to state, in a dignified manner, his views on public questions. There has been great fear that professors by their speeches or articles may diminish the number of gifts to educational institutions. No one is more interested in the financial welfare of such institutions than the professor, but must the desire for gifts from the wrong sort of rich men lead him to sacrifice his freedom of speech and lose all influence because of a general suspicion that he dare not bear witness to the truth? What is the sense in allowing institutions for teaching the truth to suppress the truth in order to secure funds for teaching the truth? Such institutions are betraying the very cause for which they came into existence. They have entered upon the career of the hypocrite and impostor, with consequences which at first are as invisible as when bankers become dishonest, but which eventually are as widespread.

The moral credit of the nation is chiefly controlled by three classes—ministers, editors and teachers—and as long as these are not suspected of moral bankruptcy we may avert a crisis. We cannot believe that those who profess to devote themselves to the supremacy of conscience and the spread of knowledge and wisdom have secretly adopted the contemptible motto, "Money is the principal thing, therefore get money." But what will be the consequence if one by one professors conclude to throttle the truth in order to keep their salaries, and editors suppress the facts in order not to lose the advertisements, and ministers silence their consciences rather than miss large donations? Moral standards will be lowered while ill-gotten wealth will be piled higher, class hatred will increase while the means of allaying it will diminish, the once trusted molders of public opinion will be discredited for having become the hated hirelings of the predatory rich, and the masses will be ready to listen to revolutionary agitators, with their desperate remedies. The only preventive of revolution is reform. The only cure for class hatred is justice. Against every form of economic injustice it is the duty of the professor of economics to protest: while continuing to hold his chair, if he may—or after having vacated it, if he must. According to the best of his ability he must distinguish truth from error and error from guilt, and then denounce the guilt unsparingly and controvert the error without intolerance and proclaim the truth fearlessly. He must emulate the grimly practical idealism of a certain New England editor who has adopted this motto, "With a mission and without a muzzle."

BALTIMORE, MD.

# The Race Problem in Arizona

BY BOOKER T. WASHINGTON, LL.D.

A FEW weeks ago, in response to a request from the white citizens and colored citizens of that city, I delivered an Emancipation address at Phœnix, the capital of the new state of Arizona. The interesting thing about this celebration to me was the number of different races and different types of people who took part in it. Any one who has traveled thru this desert country with its red mountains and yellow plains, has been imprest with the violent contrasts in the colors of the landscape. For my part, I was even more imprest with the variety and contrasts in the colors of the different elements of the population. I met there not only black men and white men, but yellow men and red men, with all the varying shades between them.

Phœnix seems to be a sort of melting pot for all the races of the earth. In this southwestern country the tides of immigration from Europe and Asia, from North and South, meet and intermingle. It seemed to me, while I was there that I met white people and black people from every state of the Union and from some parts of Canada as well. In fact, I am perfectly safe in saying, I never had an opportunity before, in so short a space of time, to meet, touch elbows and talk with so many kinds of white people, and so many kinds of colored people, as I did in Arizona.

All these people seemed to be taking part, directly or indirectly, in the three-day celebration of President Lincoln's Emancipation Proclamation. When I reached the city I found all the principal streets decorated with flags and patriotic emblems. Excursion trains were bringing in from many parts of the new state people to participate in the celebration. In the procession which escorted me from the hotel to the park where I was to speak, there were two colored bands; one of them was made up of Indian students from the United States Industrial School for Indians at Phœnix, and the

other was made up of local talent among the colored people of the city. Part of the program of the celebration was a series of three baseball games between a Negro and Mexican team. During the time I was there I had an opportunity to witness a foot race, in which an Indian, a white man and a Mexican participated. A Negro was the timekeeper. Among the speakers on the program were the Secretary of the Territory, whom the people now refer to as "Governor," George E. Young; Dr. J. Harvey Deere, pastor of the First Baptist Church, and Dr. W. B. Ball, head of the Negro college in Seguin, Tex. Besides myself, Dr. Ball was the only other colored man on the program.

The exercises were held in a great tent which had been erected at East Lake Park. When it came time for me to deliver my address, I was surprised to find that my old friend, Rev. Sam Small, whom I had known when he was editor of the Atlanta *Constitution*, and as an evangelistic preacher thruout the South, had been chosen to introduce me to the audience. I mention thees facts merely to illustrate and emphasize the number and different types of people who took part in this unique celebration. I want to speak, however, less about the Emancipation celebration than about what I was able to learn of the relation which exists among the different racial elements which make up the population of this cosmopolitan city and state.

Every one in Phœnix, I discovered, has come from somewhere else, except the Indians. The result is, you find people from all parts of the country in the most unexpected places. The little hotel at which I stopped, for example, was conducted by an American white woman from the state of Idaho. When, shortly after my arrival, I asked to have some breakfast sent up to my room, I found that I was being served by a Chinaman from a Chinese restaurant. I had heard of Chinese restaurants before, but I confess I was surprised to find a Chinaman was running a restaurant in such close connection with the hotel in which I was stopping. As a matter of fact, as I was afterward informed, there are only two restaurants in this city of 20,000 inhabitants which are not in control of Chinese. One of these is conducted by an American white man and the other by an American Negro.

The Chinese have control of nearly all the truck gardens in the suburbs of the city, and wagons driven by Chinese drivers supply the hotels and most of the homes. I confess it looked very strange to me to see a Chinaman squatting on the front seat of a vegetable wagon, driving a horse. Before I came to Arizona I had seen pictures of Chinamen drawing two-wheel carts, and I had seen other Chinamen carrying bundles on their heads, but I had never before seen a Chinaman driving a real live horse.

Meeting for the first time, in a position where one race either is, or soon will be, crowding the other in the labor market, I was eager to learn how the two races felt toward one another. I rather expected that I would find sometimes a jealousy existing between the black man and the yellow man.

While I was in Phœnix I met a colored man who had daily business dealings with the Chinese. With the purpose of getting his opinion of his yellow neighbor, I asked him if the Chinese were good business men.

"Yes, sir," he replied. "The Chinaman is the truest counter and the quickest I ever saw." With that he went on to explain to me the method by which Chinese computations are made. It seems that the Chinese merchants employ a little frame with beads strung upon it, something like that which we are accustomed to use in the kindergarten, to make their computations.

"The Chinaman just pushes these beads back and forth across that frame," my friend continued, "makes some curious mark on a slate, and tells you quicker than you can think just what you owe him. He tells you right, too."

From these remarks and from other things which I heard I came to the conclusion that, as far as concerned the black man and the yellow man, they were getting along pretty well together.

I learned another interesting fact in regard to the Chinese while I was in Arizona. In the city of Phœnix there is, as in many other cities in the West, a region that is inhabited almost entirely by Chinese and is called Chinatown. In Phœ-

nix, however, "Chinatown" has a mayor. He is called "Mayor Dick," and he seems to be the supreme authority in Chinatown. Whenever a Chinaman is arrested for a small crime of any kind—anything less than a felony, in fact—it has become customary for the police authorities to turn the man and his crime over to "Mayor Dick." They have found that they could get substantial justice more surely and more conveniently in that way than they could by dragging the culprit into the ordinary police courts and going through the ordinary processes. The reason for this seems to be that the Chinaman has very little understanding of and apparently very little confidence in the American methods of administering justice. And so the Chinaman in Phœnix, even tho he is not a citizen, gets in this indirect way a certain amount of self-government.

During the few days that I was in the city, altho I was very much hurried, I took occasion to go down to Chinatown and visit "Mayor Dick." He was a little, dried up, yellow man, who spoke very broken English. He seemed, however, to have a pretty clear understanding of American customs and manners. When I asked him how he came to be called "Mayor," he said in a quite matter of fact tone: "Well, you see, I am here thirty year. I know American custom. When Chinaboy get in trouble he come to see me. When policemen get in trouble with Chinaboy, both come to me. I know how to make it all right. So the newspapers say I am Mayor of Chinatown. Yes."

"Mayor Dick" told me that the number of people in Chinatown is gradually decreasing. Some years ago there were as many as 400 Chinamen in the city. Now there are not more than 200. The reason is that every Chinaman must some time go back to China. He is never more than a sojourner in America. If he does not go back alive, he goes back in his coffin. Once out of the country, unless he has a certificate showing that he is a merchant, he is not permitted to return. If the same is true of other cities as is true of Phœnix, the Chinese population of the United States should be gradually declining.

Now the thing that imprest me in this connection, in regard to the Chinaman, was the extent to which he is an alien in this country. I doubt whether any other portion of the population remains so thoroly foreign as is true of the Chinaman.

Sometimes people in this country speak of the Negro as an alien race, and frequently the suggestion is made that the country would be better off if the black man could somehow or other be shipped back to his fatherland in Africa. No one has yet suggested, however, that the Negro, while still living in the midst of the white civilization, was so much of a foreigner that he could not be tried by the same law and in the same courts and according to the same moral and political standards as the white man. In the first place, the life of the Negro is so interwoven with all the interests, traditions, hopes and aspirations of the white man that it will be impossible to separate them in the way I have suggested, even were it desirable. In the second place, no matter how much he may fall below the standard of the white man, the Negro has and desires no other law and no other standards than those which the white man has taught him to love and revere. However different the Negro may be in the color of his skin, he is not an alien in this country, and has no interests and no ambition which, in the last analysis, are not identical or in harmony with those of the white people by whom he is surrounded.

Another race which is just now making its appearance in Arizona is the Japanese. Like the Chinese, the Japanese frequently take up the business of truck gardening in the suburbs of the cities. The first place, however, in which they find entrance into American life seems to be as house servants, waiters in the hotels, and cooks in private families. The Japanese have not yet made their appearance in large numbers, and perhaps when they do come and begin to take the place of the colored people in hotels and in other places, the Negroes will lose some of the admiration which they conceived for the little "Yellow Peril" during the war between Russia and Japan.

Meanwhile, the Negro, in the process of adjustment that seems to be going on

between the races, is getting into other kinds of labor. Several of them own large plantations in the rich soil outside of Phœnix. One of them is engaged in running a hand laundry, in which he employs, however, Mexican women to do the work. Mexican women, I learn, have a great reputation as ironers.

One of the three wholesale fruit merchants in Phœnix is a Negro, another is making money running what is known as a "post" store, on the edge of the Indian reservation a few miles from Phœnix. Another colored man is running a restaurant, in competition with the Chinese, and has succeeded largely, as near as I could learn, from the fact that he was able to furnish what the Chinese were not able to do, namely, "home cooking." He calls his restaurant the Home Kitchen. A considerable number of colored men have made money in real estate. Negroes have pretty near a monopoly of the barber business in this city. There are five colored barber shops in Phœnix; one of them is to be located in the magnificent new Adams Hotel, which is now in the course of erection.

What is even more important to my mind than the successes of the few individuals that I have named is the general disposition among the leaders of the Negro people to consider seriously the needs of their little community and take measures to protect themselves against the danger which is likely to come to them from that drifting class, who are a greater menace in the case of colored people than that of any other race in this country.

Another class of people with whom the Negro is coming into contact, not only in Arizona, but all along the southern border, is the Mexican. The greater portion of the common labor—that is to say, work in the streets and on the farms—is performed by Mexicans. The Mexican is a valuable farm laborer in this part of the country, because he understands irrigation. The Mexicans are also the most numerous of the different colored peoples in Arizona and are performing in this part of the country much the same tasks that the masses of the colored people are performing in other parts of the South. I saw hundreds of them at work in the streets and on buildings in course of construction while I was in Phœnix.

As a rule, people do not speak very respectfully of the Mexicans. As a class, they are regarded as unprogressive, unsteady and unthrifty. The Mexican seems to have two great difficulties. In the first place, he does not have the same ambition to get education as is true, for example, of the Negro; and in the second place, it is said that he spends almost all of his surplus for drink. Unlike the Japanese and Chinese, but in that respect like the Negroes, the Mexicans are, for the most part, citizens of the country in which they live. One of the questions which is troubling the new State of Arizona is what to do with them as voters. Heretofore, an attempt has been made to disfranchise them by means of an educational qualification, coupled with a provision requiring them to interpret a certain portion of the Constitution. At the time I was there, however, I noticed that both political parties were actively organizing "Spanish-American" clubs. Ordinarily a Mexican is known along the border as a 'cholo" or greaser. But as soon as he becomes desirable as a voter he receives another name; he is called then a Spanish-American, just as the Negro, wherever he is a voter, is likely to be referred to as an Afro-American.

At the present time, the Indian is a mere spectator. I saw hundreds of them standing about on street corners in their picturesque Indian or half-civilized costumes, idly watching the strange spectacle of the new civilization which is pouring into this new country, changing its physical character and sweeping away all that remains of the primitive life and civilization.

I have tried in what I have already written to suggest something of the already complicated racial relations which I found in Arizona, and to indicate in a general way the manner in which these different races are learning to adjust themselves to the new conditions and to each other. As a matter of fact, I believe it will be found in this state that there are a greater variety of races and people who are struggling up out of a primitive and backward condition than

in any other part of the United States. In spite of this fact there is, so far as I could learn, no place in the Southwest, except perhaps New Mexico, where there is so little friction between the races and so much confidence, hope and good will among all classes, as is true in Arizona and in Phœnix. This may be due to the fact that these different races are represented as yet in such comparatively small numbers. Altogether, I do not believe that the colored people, including those other persons classed as foreigners, of which latter there are very few in Arizona, represent more than 30 per cent. of the population. There are, for example, Mexicans to the number of 13 per cent. of the whole population; 11 per cent. of the population are Indians.

My own opinion is, however, that the reason for the present conditions of harmony and progress existing in Arizona is that thus far, in this new country, each race has been given all the opportunities that have been granted to the others. Each race has been allowed to find for itself its position and place in the life of the community, and work out its salvation in its own way. In a general way, it is true that each one of the colored races has found out the thing that it could do best, and is doing its part, whether small or great, to build up the community and develop the resources of the country.

Arizona has, in one respect, all the advantages of the new country. It is not troubled by tradition. It has no past to live down. Its people have no fear of doing or attempting to do something that was not done or attempted in some other time or in some other place. I would not have people believe that there is not racial prejudice in Arizona, as elsewhere in this country; but as yet such prejudice as exists has not fixt itself in institutions, and the result is that black man, yellow man and red man have in Arizona an opportunity which, if they use it properly, will keep that state a free country, in the broadest sense of that word, for all time to come.

TUSKEGEE, ALA.

# The Sun Suitor

BY COLETTA RYAN

I CALLED upon the sun this happy day.
A genial heart was he. "Stay on, oh, stay,"
He said, "enjoy the glory of the golden ray
That urges you to happy song,
To laughter, love and life. I long
For guests like you who sparkle thru
The shadows that they may be true.
Come tarry by the stream
That we may do and dream."
How brilliantly he blazed!
The while he gently grazed
My spirit with his heart's warm light.
"Oh, sun," I said, "I am not bright,
I'm only full of good intent—
A soul of glowing sentiment
Inspired to be intelligent.
My wit and will
Would mount life's hill
To sing your praise
And walk your ways
Enamored of your golden rays."
He blithely blest the softening air
And fell to gleaming o'er my hair.
Oh, happy day of days!
"Be mine," he said. "No," answered I.
"I would live single till I die.
What witty woman ever can
Desert her heaven for a man
Whose sole profession is to shine?"
He answered, "But you will be mine!"
And I confess, without a sigh,
Day chaperoned so carelessly,
That he insisted. We were wed.
'Twas called a marriage of the head,
And if I hold the lure of light
A shining song, a spirit bright,
It is because my lord the sun,
And heaven, and earth, and I are one.
And all the years will find us true
Forever reigning just for you!

BOSTON, MASS.

# A New Method of Making Character

BY WYLLYS REDE, D.D.

Author of "Striving for the Mastery," Etc.

TEN years ago a man was observed tramping the streets of our great cities. His movements were peculiar. He scanned closely every group of people and noted every incident of street life. He explored neglected alleys. He penetrated homes and apartments. He invaded school houses. He haunted playgrounds. He frequented athletic contests, which seemed to have a peculiar fascination for him. His interest in the doings of human-kind, and especially of the genus boy, was of the liveliest character. This man was not a detective, nor a Japanese spy, nor O. Henry in search of material for stories, nor a mere lazy loafer idling away his time. He was driven by the compelling power of a high purpose. There was a sane and sensible method in his apparent madness. He was collecting materials for use in perfecting a great invention which he had made and which was destined to influence the lives of multitudes of American citizens.

This man, Milton Fairchild by name, was an earnest student of child-life for a purpose. Since his graduation from Oberlin College, of which his uncle was president, he had felt increasingly the necessity of training all young Americans in the fundamental principles of honor, thrift, kindliness, and all the good old-fashioned virtues which go to make manly and womanly character. The problem was how to do this effectively. No satisfactory system of moral education had ever been evolved. This work was being sadly neglected by most schools and even by the churches. The methods of teaching arithmetic, geography and history had received ample attention and had been vastly improved. But no practical plans for teaching ethical truths to children had been matured and put into effect. It will be conceded that a knowledge of the elements of practical morality is of more vital importance than an acquaintance with these sciences. The formulation, therefore, of a method by which the children of the nation can be taught the sound principles of moral conduct which have been adopted by men and women of intelligence and common sense is vastly more important than the working out of a new method of instruction in mathematics or geography. It is a matter upon which the safety, honor and welfare of our whole American people depend. These considerations had impelled Mr. Fairchild to undertake the task of working out a method of teaching morals and to make it his life-work.

It was evident that there was no inherent lack of interest in moral questions. They are the most fascinating topics in the world. Every great drama hinges upon them; every successful play and novel gains its chief interest from them. Conversation in any group of intelligent men or women reaches its highest point of interest when they are discussing the right and wrong of the conduct of some of their friends and neighbors. It is just so with children. Mr. Fairchild was impressed, during his study of child-life in the streets, with the

keen interest which they took in settling the merits of controversies which arose there. He overheard heated arguments between gamins, who would hardly have been suspected of such interests, as to the right and wrong of fights which had raged among their comrades. Often these discussions reached a high plane and were marked by earnest efforts to determine the right.

At last it came to Mr. Fairchild that if the interesting experiences of every-day life in which moral problems are involved could be vividly brought before the child-mind, its lively interest might be aroused and opportunities secured for exerting a deep and permanent influence. If, for instance, a series of pictures, showing the progress of a street fight among boys, could be shown, it would command the attention of every real boy and raise the moral problems involved in boys' fights. If, while attention was focused upon these, some judicious adviser were at hand to argue out with the child the points involved, he could be assisted in working them out for himself and forming right convictions. Or if some act of questionable morality were vividly pictured, the pro and con could be convincingly set forth. An heroic deed from real life would make a powerful appeal and awaken a desire to emulate it. This method had been used to some extent in illustrated story books, but not in such a systematic and life-like way as to realize its latent possibilities.

Now came the stroke of inventive genius which struck out a new line of approach to the child-mind and solved the problem of moral education. Why not use the camera and the stereopticon? Why not go right out into the streets, the playgrounds, the school houses and the homes and photograph child-life as it is in all its rich variety of experience? Why not show these pictures life-size, with a stereopticon, and thus bring home to children with life-like reality and vivid intensity the problems of conduct involved in these experiences? Then, while their minds are occupied with them, why not seize the precious opportunity to help the children to reason out in a natural and sensible way the great problems of life? If these things were well done the result could not fail to be excellent. "Seeing is believing." Such visual instruction would come home to young minds with convincing reality. It would make an impression such as could never be produced by drilling into them dry moral precepts, however excellent. Mr. Fairchild had the discernment to see that here was not merely a means of amusement, but an educational agency of the utmost importance, which would find its highest usefulness in the domain of morals. If by its use the great problems and principles of moral conduct could be got into concrete form, so that they could be seen with lifelike reality, they might be brought home with tremendous force. To meet these demands Mr. Fairchild made his famous camera and entered upon a still hunt for pictures which led him thru most of our American cities and finally abroad. He photographed everything of significance which offered itself. The result is the most unique collection of photographs in existence, illustrating various phases (but by no means all varieties) of child-life. The best of these he sifted out and prepared

MILTON FAIRCHILD
Director

A THRIFTY AND A HAPPY HOME

for use in the stereopticon. To provide verbal instruction to accompany these was a task requiring the well-digested wisdom of many minds. Mr. Fairchild, therefore, undertook to organize an advisory board of men and women in different walks of life, including a large proportion of experts in pedagogy, who should co-operate with him in the preparation of a series of Illustrated Lessons in Morals. This Moral Education Board has grown gradually until it now numbers one hundred and sixty-seven members and includes many of the most emi-

nent leaders in American social, educational, and religious life.

With the assistance of these advisers Mr. Fairchild began the preparation of his Illustrated Lessons. The first was entitled, "What Men Think About Boys' Fights," a topic which is vital to boys. Every healthy boy finds the problem of fighting forced upon him. He wonders what he really ought to do. It is not fair to the boy to let him go unenlightened on this question, which is just as vital to him as an aggravated assault and battery would be to his father. This Lesson is designed to reason boys into a gentleman's way of thinking about fighting and to inculcate manly honor and self-restraint. By 1905 a second Lesson was ready with the title "The True Sportsman." This was for older boys and was planned to enunciate and illustrate the eight great laws of sport by which the conduct of all true sportsmen is controlled. In 1907 came a third Lesson, "What I Am Going to Do When I Am Grown Up," intended for boys and girls of grammar school age. This is a problem about which children have day dreams and sometimes lie awake nights. Each of them has some cherished ambition. These childish ambitions ought to be conserved and directed. This Lesson strives to give the children a wider outlook and to bring to them the teachings of mature experience. It is of absorbing interest to every child.

These Lessons and the new ideas which they embody attracted wide attention among educators and found influential friends. Mr. Bernard N. Baker, a prominent business man of Baltimore, has devoted a fund of ten thousand dollars to the development of this work and has given it the benefit of his experience and sagacious judgment. His estimate of the value of this discovery has been endorsed by a large proportion of the leading lights in business, educational, and religious life. No such body of competent and representative judges has ever before given its sanction to any method of teaching morals. Many of the most influential men in the educational world have been outspoken in their approval. Here are a few out of the large number of favorable opinions which have been expressed. Dr. Edward A. Ross, Professor of Sociology in Wisconsin University, says: "Such graphic moral instruction is a new thing in the world. It is a great invention, like wireless telegraphy or the aeroplane." Ex-President Eliot, of Harvard, considers "the Illustrated Lessons in Morals admirably adapted for conveying to the children of public and private schools by the thousands the essentials of good manners, right feelings and cooperative justice." Professor John Dewey, of Columbia University, pronounces this "a practical, sound, and reasonable scheme of moral instruction." President Henry Churchill King, of Oberlin College, says he "cannot think that they could be given before any school without decided gain in the morals of the student body." To Professor Nathaniel Butler, of Chicago University, "the method of presenting concrete situations involving moral judgments in pictures, accompanied by the graphic matter of the lesson, seems the most effective agent for moral teaching that could be devised." Dean Griffin, of Johns Hopkins University, "can hardly imagine a child so stupid or careless as not to be reached by this ingenious method of teaching." Professor Jeremiah W. Jenks, of Cornell, believes that "if these practical lessons can be very generally used they will promote ethical culture to a noteworthy degree." Such strong expressions from the most competent judges would seem sufficient to convince even the most skeptical that a way to teach morals has been found.

The question is now squarely before the American people. Will they make the most of this discovery? Will the schools adopt this method of instruction? It has already been used to a greater or less extent in the schools of many of our large cities, such as San Francisco, St. Paul, Cleveland, Detroit, New Orleans, Richmond, Washington, Baltimore, New York and Boston. The Lessons were given last winter in fifty-five of the public schools of Chicago to 30,000 pupils and are to become a permanent feature. They are not intended to crowd out any studies from the school curriculum, but simply to supplement and reinforce it. Will the churches and Sunday schools make use of them? The

BERNARD N. BAKER
Treasurer

Lessons, as thus far prepared, are admirably adapted to their needs. They do not deal with doctrinal questions, but concern themselves entirely with the plain practical virtues upon which all Christians are agreed. They will harmonize perfectly with the regular courses of instruction which are already in use and will recommend themselves to all religious bodies. The emphasis which they lay upon the serious side of life during the week will favorably dispose the child toward religious instruction on Sunday.

Two new Illustrated Lessons have recently been completed, making five in all. One of these is on the timely and important topic, "Personal and National Thrift." In it the spendthrift, the tramp, the loafer, and the gambler are pictured in their true light and the results of their conduct are shown. Personal thrift is set forth as a protection against distress, an essential in earning a living and the basis of achievement. National thrift, or, in other words, conservation of resources, is recommended upon the same grounds and with many interesting suggestions how it should be practised. The other Lesson is entitled "The Gentleman." It is a powerful appeal to every boy to strive to attain the spirit and manners of a gentleman. Such principles as these are laid down and strikingly illustrated.

Respect the aged.
Respect the fears of those who love you.
Respect experience.
Respect authority.
Regard the rights of others.
Be quick to do a kindness.
Be thoughtful for the happiness of friends.
Ask pardon for blunders or injustice.
Confess injury done and rectify it if possible.
Never defend yourself nor others with a lie.
Guard the honor of your institutions.
Win out in a gentleman's way.
To win by fraud is quite beneath contempt.
Retain your self-respect; hold the respect of friends; win the confidence and goodwill of acquaintances.

The effort in this and all the Lessons is not to introduce revolutionary theories, nor give any "new commandment," but to teach the old, old morality which has been supreme for many generations and upon which all people of intelligence can agree.

The National Institution for Moral Instruction was incorporated in March, 1911, and includes among its directors many of our leading educators and people of public spirit. Its aim is to prepare sixty Illustrated Lessons, carefully graded, to suit the needs of all ages and classes of children. Here are some of the subjects proposed:

"Forming your Habits."
"On your Honor."
"Law and Order and International Peace."
"The Ethics of the Professions and of Business."
"The Law of the Schoolroom."
"Respect your Elders."
"What Belongs to Me and What Does Not."
"The Treatment of Animals."
"Father and Mother."

A new Lesson is being prepared upon the subject, "A Gentleman's Treatment of Women." All future lessons will be prepared by trained specialists, working under the advice and direction of the National Institution. They will be kept up to date by the addition of new mate-

rial and adapted for use in different localities, if necessary.

The basis upon which the work is now being carried on is as follows: The National Institution for Moral Instruction is ready to send out from its headquarters, 507 N. Charles street, Baltimore, or from its distribution centers in New York, Chicago, Knoxville, Tenn., and Berkeley, Cal., a set of one hundred slides for the stereopticon and a printed Lesson to accompany them for use in any school or church, for a nominal rental. Or it will send one of its experienced "special instructors," of whom it has a goodly number ready for work in their own neighborhoods, to give the Lessons wherever desired at a moderate expense. New special instructors will be appointed and trained up until, if possible, there are one or more in every city and educational center. Thus the way is open for the use of this important discovery in every church and school. It has the approval of practical men of affairs and of the educational world. It meets one of the greatest needs of our day. The growth of our great cities, with their overcrowding and their multiplied and alluring opportunities for vice and crime; the herding together of hordes of young men and women in our great commercial and industrial centers with but little wholesome restraint; the rapid decadence of home life, home influence, and home religion, with all the chastening and uplifting influence which they exerted a generation or two ago; the absence of religious teaching from our public schools and the failure of the Church to reach more than a bare majority of the children of today—these considerations make the moral problem a most anxious one. Unless we can meet these conditions and solve the problem which they present by providing sound and sensible moral instruction for the young and driving it home to their hearts, the outlook is alarming. If this new method can interest children, if it has any special adaptation to their needs, and if after a fair trial it is found to meet them, it is a discovery of the utmost importance and ought to come into immediate and general use.

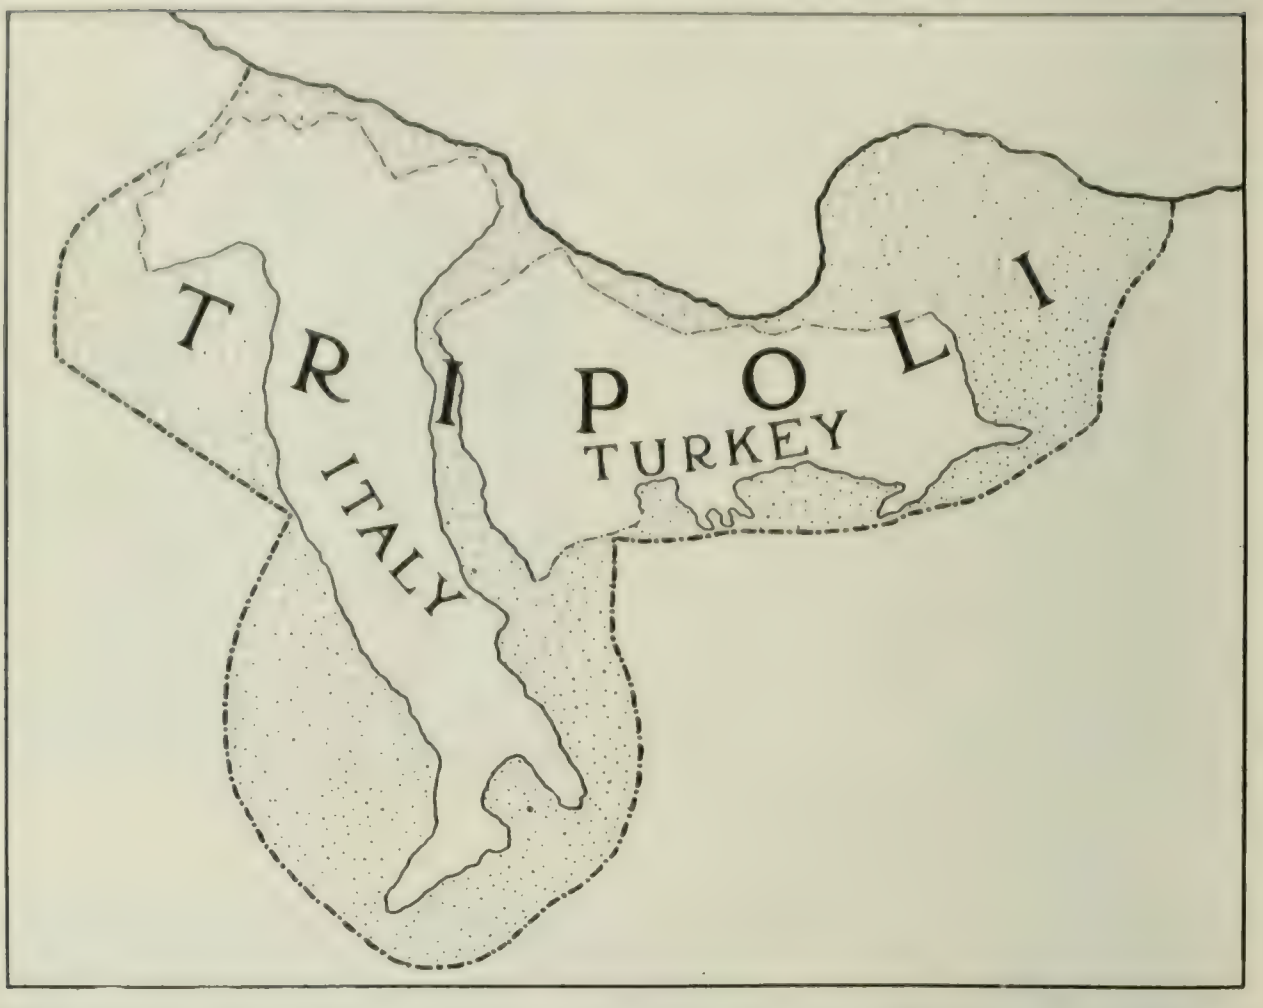
# The Sun and I

BY J. T. SUNDERLAND

THE sun pours light on the sea,
  The sun sheds life o'er the land;
The sun stoops down from his glorious heaven
  And holds the world in his hand.

But sun! I pity you so!
  For you are only a clod;
You feel no deathless Soul of fire,
  You know no Loving God!



Poor sun! I look to a day
  When all your life shall have fled;
But God and I shall live and love
  When you are black and dead.

DETROIT, MICH.

# Italy and Turkey

BY WILLIAM B. BAILEY, PhD.

Associate Professor of Political Economy in Yale University.

BOTH Italy and European Turkey could be set down in Tripoli without covering half of its territory. The area of Tripoli is over 1,000,000 square kilometers, while that of Italy is less than 290,000 and that of European Turkey under 170,000. The area of the Turkish Empire is nearly twice as large as that of Tripoli, but this includes the Turkish possessions in Asia Minor, Armenia, Syria, Mesopotamia and Arabia.

A comparison of certain statistics for Italy and the Turkish Empire may have some interest today:

| | Italy. | Turkey. |
|---|---|---|
| Population, 1910 | 34.6 millions | 24.0 millions |
| Population, per sq. kilometer | 121 | 8 |
| Exports, 1910 | $156 millions | $90 millions |
| Government income, 1910 | $498 millions | $120 millions |
| Imports, 1910 | $649 millions | $145 millions |
| Exports, 1910 | $156 millions | $90 millions |
| Railways | 17,025 kilometers | 6,556 kilometers |
| Army, peace footing | 282,000 | 220,000 |
| Naval power in guns | 1,688 | 675 |

Italy is densely populated and the natural rate of increase of the population is very high. As an outlet for congestion the Italians have been emigrating to North and South America in large numbers during the last two decades. A large proportion of these emigrants have been permanently lost to Italy. In Tripoli she sees a country with a cultivable area greater than that of Germany at the present time and with less than one person per square kilometer. This offers an opportunity for Italy to secure a colonial possession which will take care of her surplus population for a long time. Whatever motives may have conspired to make Italy take this aggressive action, the possibilities offered by Tripoli for colonization must not be overlooked. From a comparison of the Italian and Turkish resources it would appear that Italy can enforce her demands, if unhindered by other European nations.

## The Understanding of China

LAST month the news came to us, "Insurrection in Cheng-tu." This month we read, "Insurrection in Wu-chang." What mean these names to us? Very little if we are dependent upon the ordinary travel books; a great deal if we have at hand Dr. Geil's new volume on capitals and he knows how to bring out their individuality and to remove that impression of sameness that Chinese places and faces make upon us.

Let us turn to the chapter on Wu-chang, which has just come into the limelight as the center of the rebellion against the Manchu dynasty. The papers tell us that the insurgent leaders are

THE STARTING POINT OF THE CHINESE REBELLION

The Provincial Assembly of Sze-chuan, meeting in this hall at Cheng-tu, adopted resolutions opposing the plans of the Peking Government for the construction of railroads with foreign capital. The president and other officials of the Assembly were leaders in the insurrection resulting from this movement which is now spreading to other provinces and threatens the Manchu dynasty. From Geil's "Eighteen Capitals of China" (Lippincott)

*Eighteen Capitals of China*,[1] for the author has a lively enough style to make even a dry subject interesting, and what subject is drier than Chinese geography. He picks up and weaves into his description any glittering curiosity that he happens upon—legend, poem, science, anecdote—and adds the crowning touch by a Chinese proverb on the top of every other page. His frequent use of the Chinese characters in quotations and titles gives the reader the pleasant illusion of almost understanding the language. He has visited all the provincial

issuing paper money and planning to construct their own railroads. But Dr. Geil shows us that none of these things are new. Wu-chang was a capital two thousand years before the Manchus established their empire at Peking—and has not forgotten it. The students there have for years been filled with the reformatory spirit, as the author shows by quotations from their graduation theses. And when Chang was viceroy there he tried to build a railroad with Chinese capital, and issued bales of paper money and tons of cheap "cash." This brought Gresham's inexorable law into play, and the bad money, as usual, drove out the

[1] Eighteen Capitals of China. By William Edgar Geil. Philadelphia: J. B. Lippincott Co. $5

good. But Viceroy Chang had other superstitions besides a belief in hat money, as the following anecdote shows:

"Wu-chang is cut in two by the great Serpent Hill, running due east and west and dividing it into two fairly equal halves. A new road was blasted across the ridge for wheeled traffic; but when the viceroy took up his residence, he suffered from an obstinate carbuncle on his neck. The Chinese doctors declared that it was because this carriage road had cut down into the serpent's neck and was hurting his backbone. The viceroy hastily enlisted all available men and had the new cut filled in at a cost of six hundred taels; then the serpent let his neck heal."

In this connection we must refer again to another book by the same publishers, altho we reviewed it last year, *China Under the Empress Dowager*,[2] because it gives the most complete and authoritative account of recent history of the empire and of the antecedents of men who, like Yuan Shi-kai, are now taking part in the tremendous events of which we daily read. The time has come when we must know something more about China whether we want to or not, something more than that the Chinese eat with chopsticks and wear white for mourning. These two volumes will give the general reader the information he needs, and will interest him as well.

For a wider and deeper historical background to current events the reader will find useful Hannah's *Eastern Asia*.[3] It covers a field different from any other work, since it includes in a single volume the ancient and modern history of China, Japan, Korea and India, as well as of the smaller islands and dominions, on which it is often difficult to get information. Necessarily the book is written in a compact and desiccated style, but it is none the less valuable for reference.

## Is the Life of Jesus History or Myth?

An American mathematician has fired the imagination of a German teacher of philosophy and all theological Germany has arisen to put out the conflagration. The plan of operation seems to be to deluge the exposed places with books, pamphlets and journalistic articles in order to snuff out the danger before it develops further force. It is difficult for the practical American to understand the excitement that the Christ-Myth controversy has produced in the "Fatherland" or get the point of view which has led to so strenuous and aggressive a denial of the historical character of Jesus. More than fifty years ago Bruno Bauer contended that the picture of Jesus given in the Gospels was the imaginary creation of the earliest evangelists, and from Bauer's time until the close of the nineteenth century there were echoes of his claim in Germany, Holland and France. In 1902 a new impetus to the notion was given by the publication of Kalthoff's "Christus-problem," in which he set forth the theory that Christianity was the result of a social movement among the lower classes of the Roman empire and Christ was the ideal created rather than the creator of the Christian ideal. About the same time there appeared two works in English by J. M. Robertson on "Christianity and Mythology," and "Pagan Christs," which attracted some attention in Germany. These discussions were largely reinforced in 1906 when Jensen published his learned volume of more than a thousand pages on "Das Gilgamesch-Epos," in which he accounted for many of the Old Testament patriarchs and prophets, and Jesus and Paul in the New Testament, on the basis of Babylonian myths. In the same year some essays of William Benjamin Smith, Professor of Mathematics in Tulane University, were translated into the German tongue and published. The book was entitled *Der vorchristliche Jesus*,[1] and the author attempted to show from various expressions in the New Testament and contemporary literature that Christianity arose out of a pre-Christian Jesus-cult which was widespread in the Asiatic and Greek world about the beginning of our era. With the exception of the efforts of Kalthoff, who because of his social theories and passion obtained a generous hearing, none of these works made any great impression on the learned world or on the reading public. So matters stood when some of these books, in particular those of Robertson

[1] Der Vorchristliche Jesus. *Von William Benjamin Smith.* Giessen: Alfred Töpelmann. 4 M.

[2] China under the Empress Dowager. Being the history of the life and times of Tzu Hsi, compiled from state papers and the private diary of the comptroller of her household. *By J. O. P. Bland and E. Backhouse.* Philadelphia: J. B. Lippincott. $4.

[3] Eastern Asia. A History. *By Ian C. Hannah.* New York: Frederick A. Stokes Company. $2.50.

and Smith, came to the notice of Arthur Drews, a Professor of Philosophy in the Hochschule of Karlsruhe, and he became the prophet of the new idea. Drews is a monist and had in the year in which Smith's book appeared written a work on the monistic view of religion. He felt that the one great obstacle which blocked the way to a reception of his philosophy of religion was the historical Redeemer in Christianity. With great avidity therefore he seized upon the possibility of removing that obstruction thru following the lead of Jensen, Smith and others. His "Christusmythe," now translated into English from the third revised and enlarged edition,[2] was the result of his first attempt to drive the foe of his new religion from the field. The book's popularity and influence have been due partly to its clear, vivid and often passionate literary style, much of which has been lost in the new English edition. It is full of striking phrases and shows the author's great powers of imagination on almost every page. Thru it runs a popular appeal backed by a religious enthusiasm bordering close upon fanaticism. These qualities must attract readers, but they often lead the author into excesses either in polemics or in the interpretation of his facts. Drews seems to base his denial of the historical character of Jesus on the lack of non-Christian evidence for the life of such a person, on his contention that the earliest Christian sources regard Jesus as a God and not a man, and on the further claim that the most satisfactory explanation of the rise of Christianity and the early Christian writings can be given, if the element of a personal founder be omitted. This last point is largely affected by the supposed prevalence in Asia Minor of the pre-Christian Jesus-cult, compounded of traits taken from many Oriental, Greek and Hebrew sources. Out of the cult Christianity is supposed to have sprung, carrying over into its rejuvenated existence all sorts of myths and gnostic elements, which could only be maintained against the pressure of the new religion's foes by the invention of the historical and human character of Jesus. In constructing and pursuing these lines of argument Drews becomes involved in so many contradictions and makes such impossible deductions that, did his book not reveal great learning and sincerity, no one would take him seriously. The author's dexterity in identifying unlike names is astonishing. "Elijah (Eli-scha) and Jeho-schua (Joshua, Jesus) agree in their names." *Agnus dei,* Lamb of God, is merely *Agni deus,* the Hindu god of fire. Moses of course is not a historical person but Mên, the Moon-God of Asia Minor, and Elijah again is really the Greek ἥλιος. (Evidently Drews did not know that the latter ground had been pre-empted by Professor Cheyne, who has held that *Elijah* is a corruption of *Baal-Yerahme'el!*). Under the name of John the Baptist is concealed "the Babylonian Water God, Oannes (Ea)." The identification of myths is no less astonishing. According to Drews, Joshua crossing the Jordan, Jesus going up to Jerusalem, and Jason seeking the golden fleece are all variants of the same myth, and refer originally to the annual journey of the sun thru the signs of the Zodiac. "He must increase but I must decrease" is "a speech which probably at first referred to the summer solstice, when the sun, having reached the highest point in its course, enters the winter hemisphere and loses strength day by day." This manipulation of curious conjectures as facts is well illustrated in the discussion of the cross in the Old Testament. Not a scintilla of real evidence is furnished by the author's guesses in regard to the sign on the doorposts at the time of the passover, the position of Moses with Aaron and Hur staying up his hands, not to mention the entirely foreign passage cited in Isaiah, yet a few pages further on we read: "In the Old Testament also, as was shown above, we meet the cross!" These are by no means isolated or unusual examples, but characteristic features of Drews's method. Such feats of the imagination and vaulting of philological barriers may be interesting, but will not appear convincing. The author fails fundamentally in the lack of a true feeling for the historical development of the Christology of the New Testament

[2] The Christ Myth. By Arthur Drews, Ph.D. Professor of Philosophy in the Technical High School, Karlsruhe. Translated from the Third Edition (Revised and Enlarged). By C. Delisle Burns, M.A. Chicago: The Open Court Publishing Company. 1910.

is revealed by careful historical and literary study, and in exaggerating the evidence for a pre-Christian Jesus-cult. If any one desires to feel afresh the tremendous hold modern Christianity has on historical reality, he can easily do so by going over a few chapters of Thompson's "Jesus According to St. Mark," and then reading this book, which is loaded with all kinds of learning, written with assurance and the fire of enthusiasm, and inspired by an imagination that is truly wonderful, and which yet utterly fails to impress one as much more than a fancy or a dream.

German criticisms of the Christ-Myth theories have poured in from all sides. Addresses on the subject have been given by pastors and professors in various centers, and the discussions have been published in numerous pamphlets. Zimmern has collected and interpreted the pertinent Babylonian material,[3] and Professor Clemen of Bonn has published his brilliant lectures[4] delivered before the university last winter. The veteran Professor Chwolson,[5] altho past ninety years of age, has come forward with an appreciation of the non-Christian evidence for the historicity of Jesus, and Dr. Bornemann[6] and his co-workers have made an admirable direct and indirect reply to Drews, which has been finely translated into English. On the other hand Drews has taken the platform in his own defense and has continued his crusade by the publication of a second volume,[7] in which he answers his critics in a detailed discussion of the outside evidence as well as the witness of the Gospels concerning Jesus. Not much, however, seems to be added to his previous work, except in matters of a polemic nature. A far more scholarly tho no less enthusiastic contribution to the defense of the mythical interpretation of the Gospels is the new volume by Professor Smith,[8] whose former book gave Drews the basis for his work. Professor Smith is a keen thinker, a skilled apologist, and a scholar familiar with an immense range of literature on the subject. His criticisms of the liberal school of German theology represented by Schmiedel are very forceful and telling. The new reading of the history of the rise of Christianity without the historical Jesus may be found in Lublinski's recently published work,[9] which has the double charm of clarity and poise. While there is no reason to think that the main thesis of these writers will ever be established, some good will doubtless come out of the discussions in the way of showing more clearly the universal elements in Christianity and revealing more fully its relations to the religious thought in the midst of which it was developed.

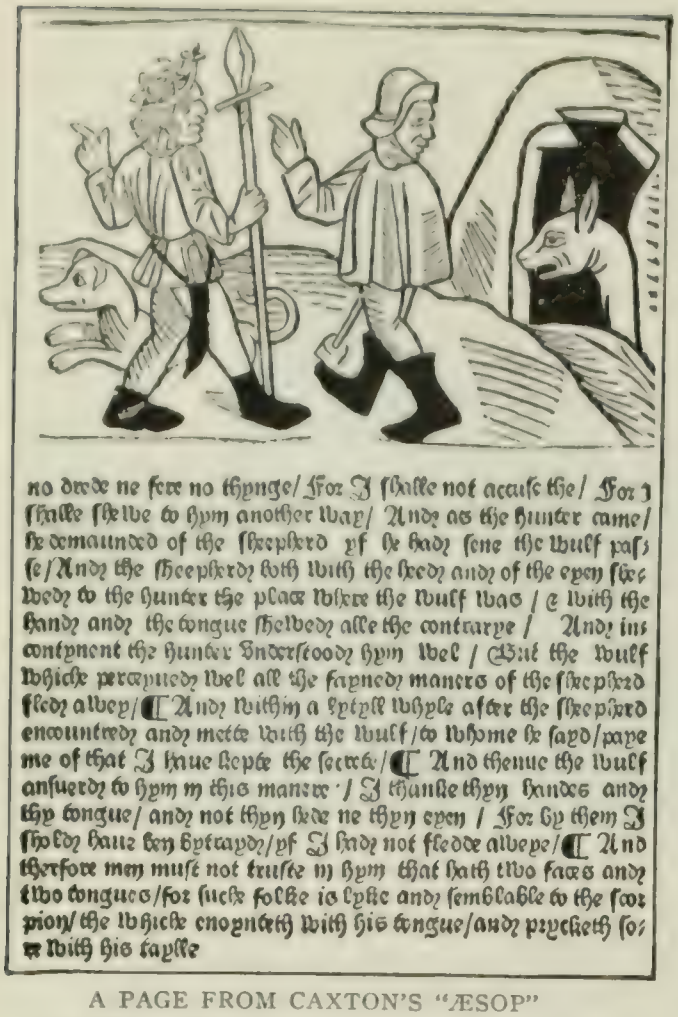
**California Under Spain and Mexico, 1535-1847.** By Irving Berdine Richman. Boston: Houghton Mifflin & Co. $4.

The historian of the Pacific Slope labors under disadvantages unknown to his fellow-worker on the Atlantic. His materials are nearly all yet in the manuscript in which they were created. In the great Bancroft Library, now belonging to the University of California, many of them are accumulated, and more are being added from time to time. So few workers have handled them, however, that as each comes forth with his sack of grist he may be judged only by the things he carries with him. There are no great series of published records, no voluminous proceedings of historical societies, none of that historical moraine which the glacier of investigation has distributed thruout the East. Moreover, and to his great discouragement, the history of the Pacific Slope has been "spoiled" by the diligence of Mr. Bancroft, whose massive volumes treat no



THE HARBOR AT GORINCHEM
Illustration from "The Spell of Holland" (L. C. Page & Co.)

part of the West adequately tho they have destroyed much of the novelty that, but for them, would be attached to the writings of other men. Mr. Richman, an Iowa lawyer, with an enviable standing as a student of history, has undertaken to rewrite the history of that "Old California," which is forever gone. When the Americans came in, hot on the pursuit of gold, the former Spanish civilization faded away, leaving little that was tangible to its successors but its architecture. None would or could think of New England without its Puritan ancestors, but he who should think of the hidalgo as the forebear of the California of today would misunderstand the past as well as the present. From the discovery of Upper California to the American invasion, the author carries an entertaining narrative across three centuries. He has an eye for the picturesque, and a gift for easy-going description. His study of the manuscript sources has evidently been careful; indeed his critical notes are a valuable contribution to our knowledge of his subject. But his work, in the situation in which southwestern history finds itself, invites the question whether he has materially improved on H. H. Bancroft. He says himself, that Bancroft and his clerks used his collection "well-nigh to exhaustion." He has no wide, first-hand acquaintance with the archives of Mexico, or Spain, or England, or Russia which would give him standing in the field which he now exploits, nor does he claim such. His book, until it is supplanted by the work of men who have spent more than "two years' investigation" in California, will stand as a useful and readable narrative of that portion of the history of California which belongs to Spain.

**The Spell of Holland.** By Burton E. Harrison. Boston: L. C. Page & Co. $2.50.

From the first page this addition to the Little Pilgrimages series makes good reading. The material is far from fresh, but the manner of dealing with it makes us forget that. Either stay-at-home or intending tourist will enjoy Mr. Harrison's account of his wanderings thru the Netherlands. There are a large number of illustrations from photographs, one of which we reproduce.

no dede ne fere no thynge/ For I ſhalle not accuſe the/ For I ſhalle ſkelpe to hym another day/ And as the hunter came/ he demaunded of the ſheepherd yf he had ſene the wulf paſſe/ And the ſheepherd toth with the hede and of the eyen ſhewed to the hunter the place where the wulf was / & with the hand and the tongue ſhelded alle the contrarye / And in contynent the hunter vnderſtood hym wel / But the wulf whiche perapuedy wel all the fapnedy maners of the ſhepherd fledy alwey/ ¶ And within a lytyll whyle after the ſhepherd encountred and mette with the wulf/ to whome he ſayd/ pape me of that I haue kepte the ſecrete/ ¶ And thenne the wulf anſwerdy to hym in this maner · / I thanke thyn handes and thy tongue/ and not thyn hede ne thyn eyen / For by them I ſholdy haue ben bytrayd/ yf I hady not fledde alwey/ ¶ And therfore men muſt not truſte in hym that hath two faces and two tongues/ for ſuche folke is lyke and ſemblable to the ſcorpion/ the whiche enoynteth with his tongue/ and pryeſteth ſore with his tayle

A PAGE FROM CAXTON'S "ÆSOP"
From "The British Museum" (L. C. Page & Co.)

**The Records of the Federal Convention of 1787.** Edited by Prof. Max Farrand, of Yale University. 3 vols. 600 pp. each. Royal Octavo. New Haven: Yale University Press. $15.

Now when the Constitution is under fire from several different directions and questions of its interpretation are more hotly contested than ever, Yale University has done the country great service in publishing this collection of all the existing material on the convention which originated it. The editor has adopted a chronological order, bringing together the various records of the proceedings of each day, first the official Journal, followed by the notes of Yates, Madison, King and other members of the convention. The sessions of the convention were secret and it was not until thirty years afterward that full accounts of it appeared, and among these there are many discrepancies and contradictions. The third volume contains supplementary material from letters, pamphlets, debates, diaries and notes, throwing light on the actions and motives of the delegates. The work is printed in a style worthy of its importance. No historical library can afford to be with out it.

*

**The British Museum: Its History aud Treasures.** A View of the Origins of that Great Institution, Sketch of Its Early Benefactors and Principal Officers, and a Survey of the Priceless Objects Preserved within its walls. By Henry C. Shelley. Pp. 355. Boston: L. C. Page & Co. $4.

It is claimed for this illustrated account of a great national institution that it is "the first attempt to combine within the scope of a single volume an ordered history of the museum and a conspectus of its contents." The larger part of the volume is properly devoted to the second of these matters. The British Museum, great tho it is, is by no means overwhelmingly ancient, dating from the later eighteenth century. Mr. Shelley, author of an entertaining book on the "Inns and Taverns of Old London," is just the man to tell entertainingly the story of the collections and their donors, and to give a popular audience some notion of their treasures.

*

**Wages in the United States.** By Scott Nearing. New York: The Macmillan Company. $1.25.

This is a careful, scientific compilation and analysis of the wage statistics available in the United States, made with a view to determining what are wages. On the whole the conclusions coincide with previous tentative decisions. It appears that three-quarters of the adult males and nineteen-twentieths of the adult females employed east of the Rockies and north of the Mason and Dixon line actually earn less than $600 a year. Three-fifths of the adult females receive less than $325 a year, the wages of women, despite the activities of suffragists and feminists, being pretty universally less than the wages of men. Those high wages about which protectionists and spread-eagle patriots so fondly boast are discoverable only among a small proportion of employees, less than ten per cent. of workmen, and those highly skilled, being paid twenty dollars a week or

more. It appears that wages do not vary much from city to city and State to State in the organized trades, and that the geographical variation is not so marked as is commonly supposed. Tho wages in the South are lower and in the West higher than the average, the differences are not very wide. From occupation to occupation of similar difficulty the variations are more extreme, the element of luck or chance seeming to enter into the question of how much a particular man of given ability will get for his labor. Altogether, the book is valuable for anybody interested in the main question of the day, the labor question.

## Literary Notes

....On the cover of a book called *Human Confessions* one reads the account of it by the publishers:

"Out of the welter of the commonplace here rises the voice of a man who has *something to say*. . . . He writes straight to the vitals of common humanity."

It is impossible for a mere reviewer to compete with writers of such winged words as these. Yet the Rev. Frank Crane's little essays, in spite of the publisher's exaggerated claims for them, are thoroly enjoyable and crisply written. (Chicago: Forbes; $1.)

....*Where the Shamrock Grows* is a pleasant tale of Irish country life, told by George H. Jessop (Baker & Taylor; $1). In spite of one sudden death in the last ten pages, it is not so boisterous as some of its kind, and perhaps that circumstance partly accounts for its being rather more suggestive of reality. There is a certain amount of horsiness—one auction—one villain—an uncle from America—two love affairs: quite ingredients enough to make its reading a pleasant undertaking for a rainy week-end.

..."Next to translations," confesses Professor Gildersleeve in the *Journal of Philology*, "I have learned to abominate historical novels, once the joy of my heart. For me, in my old age, historical novels fall into just two classes. Either I know the period after a fashion and then I am irritated by all manner of trifling incongruities or harassed by importunate questionings, or I don't know the period, and then I am filled with disgust at my own ignorance, a disgust not unaccompanied by a vague suspicion of my authority for the time being."

....A former Rhodes scholar and senior Demy of Magdalen College, now Instructor in English at Yale, is the author of a work entitled "History of English National Drama to the Retirement of Shakespeare." In bibliographies and illustrations as well as in his text the author has brought thoro scholarship and wide reading to bear upon his subject, and we venture to prophesy that these twelve chapters will be found to make an exceptionally useful textbook for college classes in English dramatic history. (*The Tudor Drama* By C. F. Tucker Brooke, B. Litt. Pp. 461. Boston: Houghton Mifflin Company $1.50.)

....The Leland Stanford Junior University has established a lectureship, similar to the Ingersoll foundation at Harvard, to be known as the "Raymond F. West Memorial Lectures on Immortality." The first course of lectures was given last winter by Charles Edward Jefferson, pastor of the Broadway Tabernacle, New York, who took for his subject *Why We May Believe in Life After Death.* In spite of many appearances to the contrary, Dr. Jefferson believes that the present age has a deep interest in human destiny. In his restudy of the question he conscientiously presents the arguments against as well as for immortality. The lectures are written in the author's usual clear and appealing style, and are published by the Houghton Mifflin Co. ($1.)

....Our attention is called to two literary expressions of negro ambition and courage. One is *The Crisis,* edited by Prof. W. E. Burghardt Du Bois, so well known for his writings which tell us what is in the souls of black folk. The editor is the spokesman of the National Association for the Advancement of Colored People, of this city, and his magazine has the cooperation of Prof. Kelly Miller and other defenders of racial rights, white and colored. It is illuminative and intelligent. The other is *Ethiopia Unbound,* a volume in the guise of a story which is but a disguise to set forth the way our Christian civilization and our Anglo-Saxon arrogance appear to a black native of the Gold Coast of Africa, who prefers Mohammedanism to Christianity and the native paganism to either—and who looks forward to seeing Africa belong to the Africans rather than to the Europeans who have partitioned it. The book is worth reading.

....From the Macmillan Company we receive *Romeo and Juliet* in a new and most attractive edition, "The Tudor Shakespeare," edited by Professors Neilson and Thorndike. This edition will be published in forty volumes, at 35 cents each, and assigned to various American scholars; among them Professors Cunliffs, Sherman, Alden, Parrott, Baker and Lovett. Many of the names on the editorial list are those of comparatively young men, and of professors in Western or middle Western universities. The frontispiece here is a reproduction of the "Chandos portrait," painted by John Taylor. The best

distinguishing feature of the text is that it is that prepared by Professor Neilson for one of his earlier Shakespeares. There is a brief introduction, and an equally brief body of notes; also an excellent little glossary. The book is durably bound, but is no less adapted to the library of a booklover than to the student's desk.

....Admirers of Prof. Alfred Loisy who have not felt able to invest thirty francs or more in that theologian's two volumes on the Synoptic Gospels will be glad to learn that the distinguished writer has published in a modest volume the introductory chapters of his larger work, for the most part re-written and somewhat extended. In *Jésus et la Tradition évangélique* (Paris: Nourry, 3 fr.) Loisy discusses the rise and historical character of the Gospel tradition as finally embodied in the Synoptics, accepting in the main the extremest view of the German liberal school. He sets in order the few facts which he regards as certain about Jesus' career, although he does not think the materials we have warrant the attempt to write a "life." In the teaching of Jesus the coming kingdom, of which he was to be the head, is, according to Loisy, the theme around which all else centers. In these lines of exposition the author is very radical, almost scouting the idea of the miraculous. He ascribes many and important elements of the Gospels to myth and legend, and puts such an estimate upon Jesus' personality, work and teaching as will seem to most students entirely incompatible with the after events of Christianity.

....The Rev. Cyril W. Emmet, M.A., has written a very scholarly and trenchant criticism of the work of Schweitzer and Loisy on the life of Jesus. The book, entitled *The Eschatological Question in the Gospels* (imported by Scribners; $2.25) contains also some essays not directly related to the subject thus announced, but all dealing with phases of New Testament criticism. The writer belongs to the liberal school of investigators represented in Germany by such men as Harnack and Bousset. Mr. Emmet declares that the eschatological Jesus of Schweitzer is but a one-sided portrait, and, if taken as the whole, presents a character that it would be difficult to admire or love, while he contends that the criticism of Loisy found in his "Les Evangiles Synoptiques" makes it impossible for us to know the historic Jesus at all.

....*Tid-Bits* is sponsor for the latest book-buying yarn. Some one who wanted a copy of "Tales from Shakespeare," by Charles and Mary Lamb, and was in a great hurry, cut the title down and asked the clerk at the book counter of a department store whether she had "Lamb's Tales." With a far-away look she remarked, in a most superior tone: "Lambs' tails? Fur department—third floor."

## Pebbles

THE much annoyed customer departed and the saleswoman approached another customer and began to tell how disagreeable the first had been, and then assuming an air of superiority remarked:

"But I kept perfectly calm, remembering that self-possession was nine points of the law."—*New York Sun*.

"THAT member of Congress says you have voted for him for the last fifteen years."

"That's right," replied Farmer Corntossel.

"You must think a lot of him."

"Well, I dunno. You see, fifteen years ago I had a couple of hoss trades with him, an' since then I've allus felt safer with him spendin' so much of his time in Washington."—*Washington Star*.

AN American was overheard to ask a porter in a Geneva hotel: "Is there a museum in this town?"

"No, sir," said the porter, humiliated by this disgraceful confession.

"Thank God," the young American cried fervently, and shook the astonished man's hand.—"Talk of the Town," by Mrs. John Lane.

"I WAS once entertained at a Paris restaurant famous for its chef," says Mrs. Rorer. "We had such dishes as salmi of becasse, etuve of beef, and aubergine au gratin, and then my host, leaning back with a satisfied smile, handed me the menu and said:

"'And what'll you have next, Mrs. Rorer?'

"'Well,' said I, 'I think we'll have indigestion next.'"—*Philadelphia Record*.

THE supervisor of a school was trying to prove that children are lacking in observation.

To the children he said, "Now, children, tell me a number to put on the board."

Some child said, "Thirty-six." The supervisor wrote sixty-three.

He asked for another number, and seventy-six was given. He wrote sixty-seven.

When a third number was asked, a child who apparently had paid no attention called out:

"Theventy-theven. Change *that*, you thucker!"—*Everybody's*

A CORRESPONDENT of the Philadelphia *Ledger* recalls an epitaph "which may be seen in an old Moravian cemetery in Gloucester County, N. J. It is this:

Remember, friend, as you pass by,
As you are now, so once was I;
As I am now thus you must be,
So be prepared to follow me.

There had been written underneath in pencil, presumably by some wag:

To follow you I'm not content
Till I find out which way you went."

# The Independent

Entered at New York Post Office as Second Class Matter
Publisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## The La Follette Conference

WHILE it is true that the recent conference in Chicago of Progressive or Insurgent Republicans represented a considerable number in the party, we presume it is not regarded with alarm by the supporters of Mr. Taft, whose renomination it is the purpose of this movement to prevent. Only two Senators were present; others who had been expected were unable or unwilling to attend. So far as a candidate was concerned, the conference was in the interest of Senator La Follette, and he was formally indorsed for the Republican Presidential nomination in the resolutions which were adopted. These resolutions were set forth as a platform, and it seems to us that they leave much to be desired.

As for the candidate, we must point out that the latest issue of his weekly magazine makes him a rival of Mr. Bryan in abuse of the Supreme Court. Mr. Bryan virtually asserts that President Taft, in his appointments of Justices, has sold this great tribunal to the Trusts. The Wisconsin Senator's magazine, *La Follette's*, for October 14, has on its first page a cartoon, representing the "Courts" as a corpulent laundress at a large tub, washing "Trust cases" with "money worship" soap. Near at hand, in a tilted chair, comfortably smoking his pipe, is a fat man labeled "Special Privilege," and over the cartoon is the following explanatory head line, "His Chief Means of Support." In order that the meaning of all this may be clearly seen, Mr. La Follette has placed under the picture these remarks:

"Gilbert E. Roe, in his articles on 'Our Judicial Oligarchy,' said, 'The twin pillars upon which the whole structure of Special Privilege rests in this country are two decisions of the Supreme Court.' The House of Governors recently voted to protest to the United States Supreme Court against the usurpation of power by minor Federal courts in behalf of Special Privilege. President Taft the other day said: 'I love the judges. I love the courts. What distinguishes this country from any other one is the Supreme Court we have in Washington that often has stood between us and errors that might have been committed that would have been greatly injurious to this country.'"

We notice that Mr. Roe attended the conference and was made chairman of the Finance Committee; also that one of the two Senators present, Mr. Clapp of Minnesota, characterized the President's veto of Arizona's recall for judges as "the blackest chapter in all tyranny outside of the absolute despotism of an unbridled king." Even in Arizona they do not go so far as that, but they may not be so familiar with all of tyranny's dark chapters. We prefer the attitude of Mr. Taft toward the Supreme Court to that of either Mr. Bryan or Mr. La Follette

The platform, as we have said, leaves something to be desired. First, because it completely ignores tariff reform. There is not a word in it about downward or other revision, the bills recently passed, or Mr. Taft's vetoes. And yet the insurgency of Republicans in the Senate had its origin in earnest protest against objectionable provisions of the Payne-Aldrich revision. In that work certain Insurgent or Progressive Senators, foremost of whom was the late Mr. Dolliver, made a fine record. Why is the platform silent as to this subject? Is it because a later record, made with respect to the reciprocity agreement and the bills of the House Democrats, is one

that suggests disagreeable complications? Is it because this later record, made when certain Progressives appeared to be moved by hatred or intense dislike of the President, disclosed much inconsistency and sharp disagreement with their utterances during the memorable tariff debate of 1909? At all events, the omission is quite remarkable. Surely the conference should have exprest in its platform some opinion or purpose with respect to that issue, which probably will lead all others in the coming campaign.

In addition to a recommendation that the choice of Republican voters as to Presidential candidates be ascertained by a direct primary vote, the platform contains the following words relating to the Trust problem:

"The present condition of uncertainty in business is intolerable and destructive of industrial prosperity. It is worse than idle to leave the question of whether great business enterprises are legal or not merely to judicial determination. Industrial corporations should by affirmative legislative enactment be given definite rules of conduct by which business shall be made safe and stable, while at the same time the interests of the public shall be fully safeguarded. We seek constructive legislation, not destructive litigation."

We have recently spoken of the uncertainty by which business is affected, owing to varying interpretations of the Sherman act, and we should have welcomed a clear statement from the conference as to remedies that might be applied. The platform utterance is not sufficiently plain. This is indicated by comments in the daily press. For example, one paper that opposes the prosecution of Trust combinations calls this utterance "thoroly sane"; another, which demands strict enforcement of the Sherman act, asserts that the platform invites Trust magnates to raise a La Follette campaign fund; a third calls it an appeal for the support of great corporations. Cannot legality or illegality best be ascertained by judicial determination? That has been an accepted doctrine. And if Congress should make "definite rules" for conducting business, would there not be more or less litigation to compel obedience to these rules? We are not inclined to criticise adversely this part of the platform, so far as its purpose is concerned, for this seems to be commendable, but the conference should have specified clearly the means and methods which it may have had in mind. There is need of further legislation concerning this highly important subject, and we have thought that inquiry should be made by a competent commission.

The conference lost a most inviting opportunity to make a great platform. It made a short one that disappoints by reason of omissions as well as on account of its vagueness. Even if the platform had been good, comprehensive and clear, however, it would not have caused the nomination of Mr. La Follette, nor, in our judgment, would it have prevented the renomination of Mr. Taft. But it would have compelled the party to better its condition by striving to meet the just demands of the people, especially with respect to the cost of living, which is the issue that will have more weight than any other at the polls. If the party can prove that its legislation is not responsible for the increased cost of living, it should do so without delay. If it must admit responsibility for a part of the increase, it should defend its action or promise remedial legislation. If it believes that a large part of the higher cost is due to influences beyond its control, it should show what these influences have been and are.

Mr. Taft is a good President. He is a Progressive Republican, but he does not realize how important this issue of living cost has become. He is not a representative of that Special Privilege which the Chicago conference denounced. He was unfortunate at the beginning of his term by reason of his relation to legislation about the tariff, a subject as to which he had not sufficient knowledge. Probably he was not well advised. He has not been fortunate in the quality of all the members of his Cabinet. But he has sought earnestly, industriously and intelligently to serve the people.

After Canada's rejection of reciprocity there were some who said that he must now come before the people with empty hands. That was not true. Among the things which he could show in his hands were his treaties of arbitration, his proposition for a broad applica-

tion of the merit principle to the civil service, his plans for reformation of the land laws in Alaska and elsewhere, his admirable course during the revolution in Mexico, his excellent appointments to the Supreme Court, his treaties and policy concerning the debts of Central American states, and even his reciprocity agreement with Canada, for he negotiated it and successfully promoted the acceptance of it in his own country. It is not his fault that several of these projects have thus far come to nothing, that the land laws have not been improved, that the postmasters and collectors are not in the classified service, that the peace and loan treaties have not been ratified. It is the fault of Congress, or of his party in the Senate, where the Progressive or Insurgent Republicans have either opposed him or given him no aid.

## The Future of Direct Democracy

A READER of THE INDEPENDENT asks whether there is any significant relation between the facts set forth in Mr. Poultney Bigelow's article, "In Darkest Connecticut," and those summarized in the editorial on "The Greater Democracy of California."

Whether driven out and destroyed by Protectionism, as Mr. Bigelow assumes, or eliminated by other causes, the old-time New England agricultural population of Puritan descent has nearly vanished from Southern New England, and the beautiful old farms, with their comfortable and well-kept houses that sheltered large families brought up to thrift and happiness, have fallen into the hands of immigrants of Southern European nationalities, to whom the Puritan tradition means nothing, and who, perhaps, as American citizens, will never attach importance to those ideals which shaped the Puritan commonwealths. On the Pacific Coast is a prosperous and ambitious population in which the infusion of New England blood and New England ideas is large and apparently controlling. This population is politically the most alive and progressive element in the United States today. It is doing on the large scale what the early New Englanders did on the small scale—creating a practical, efficient, successful democracy, taking advantage of modern means of communication to develop for an entire commonwealth the town meeting plan of government.

In the vast stretches of our national domain that lie between Connecticut and California dwell most of the human millions that make up the American people. They are not so alien and unassimilated as the newer rural population of Connecticut, nor politically so homogeneous and alive as the people of the Pacific Coast. What influences are likely to dominate in their moral and political evolution? Are they likely to lose so much of the older American tradition as survives among them, or will they feel the contagion of the new political life of California, Oregon and Washington?

New England, New York and Pennsylvania have suffered the fate of mixed populations in which the ignorant element is a large and dangerous factor. They have fallen under the rule of the boss and the machine. The Protestant Churches in these older commonwealths have been fighting a losing campaign. The hillsides and valleys are dotted with their closed and decaying churches. In place of them, the Roman Catholic Church in every manufacturing town and village flourishes and enlarges its congregations.

All of these facts must be taken into account in any attempt to forecast the future of American democracy. To them must be added an account of the distinctive sociology of the Southern States, where the evolution of a new social order on the ruins of the old slave-owning aristocratic system proceeds slowly, and contends with formidable difficulties.

Beyond a doubt direct democracy on a magnificent scale would be the political system of America if the American people were constituted mainly of descendants of the old English Puritan stock. That stock worked and could work the town meeting plan as naturally and as easily as it could dispose of a Thanksgiving dinner. But direct democracy is not naturally and easily developed by a Tammanyized New York,

a Quay-organized Pennsylvania, or a Lorimer-ridden Illinois.

Nevertheless, there are good reasons for expecting that direct democracy will slowly make its way, even in darkest middle America. They are found in the labor movement. The organized wage-earning classes the world over believe absolutely in direct democracy, and have no use for any other governmental system. In their own affairs they employ it. They are learning its methods, and, on the whole, becoming expert in them. This political factor, co-operating with survivals of democracy in New England, and the vigorous new democracy of the Pacific States, may, in the long run, prove powerful enough to shape the political system of the future American people.

## Denationalized, Unpatriated

EDWARD EVERETT HALE'S famous story of "The Man Without a Country" has brought tears to many eyes and kindled many fires of patriotism. The isolated man deservedly punished for a crime against his country lived a long death shut out from his native land, deprived of right in any other country, a pitiful object, pitiful because he had betrayed his country and thereafter could have none.

Do our readers comprehend that there are hundreds of thousands of men who complain that thru no guilt of their own they have been deprived of a country, that they have lost their citizenship, that they have no flag, and that we refuse to allow them the name or rights of citizens? They are the Porto Ricans.

Like hundreds of others, a Porto Rican came to this country—for we have one—to study a profession. Having finished the course he applied for admission to the bar. He was told that he could not be admitted because he was not an American citizen. He did not see why he should not be a citizen, having lived for so many years under the dominion of the flag, but no law had admitted him. He was told he could, however, become a citizen after two years' residence in this country if he would make application. He did so, and found that he was required to forswear allegiance to the King of Spain. But he replied that he had no such allegiance to forswear. But the oath was required, and he took it, adding his readiness to forswear allegiance equally to the Czar of Russia and the Emperor of China. In order to become a citizen and have its rights he had to leave his island and come to these United States. The million of people living in Porto Rico cannot be naturalized. They must remain without a country.

At a session of the Mohonk Conference last week more than one Porto Rican pled for citizenship. They said: "Whenever we ask for citizenship the answer is made that the island was never so prosperous; that it never had such exports, never raised so much sugar and coffee. But are these material things all we care for? Have we no heart, no soul, no sentiment? Don't we want a right in the country, a share in its flag?" The tale was told of a Porto Rican who was maltreated in a neighboring island and appealed to the American consul for protection. He was refused, because he was not an American citizen, and appeal sustained the consul.

Doubtless the Mohonk Conference was right in asking Congress to enact a law which will give, at no expense, citizenship to every Porto Rican who will ask for it; but why not give the right to every one by a general law? The one and only reason we have ever heard is a kindly one. It is that under our Constitution, were we to make Porto Ricans citizens, we could not give the island special privileges which it now possesses. We allow to Porto Rico, as we do to the Philippines, the right to retain for its own use all the income derived from customs and internal revenue. Porto Rico is still poor, and but for this it could not support its schools and build its roads. We give no such privilege to New York or Arizona. If New York could keep its customs and its internal revenue it could, after paying all State expenses, return a handsome dividend to every citizen. Take from Porto Rico this privilege and its schools would collapse and the wonderful progress there developed would be sadly reduced.

We would have citizenship given to every Porto Rican who asks for it, but it

might be well to wait for universal citizenship till it would be safe to send to the general treasury at Washington the come from customs and internal revenue. Then Porto Rico could be made a Territory or a State, and be treated like our own States. That is what we should aim for as soon as possible. But meanwhile the condition is not quite as bad as has been represented. If the Porto Ricans are not citizens they are yet voters. They do not vote for President, but they do elect the most of their own rulers. They constitute the lower house of the legislature, and are members of the upper house. They are judges and mayors. They have more rights than have most of our women. The American flag floats over their public buildings, and their children are taught to salute the flag. The flag does protect them in Porto Rico, if it does not in Jamaica. Nevertheless, they have not the full right in the flag. There is a sentiment that is lost and Latin-Americans are rich in sentiment. Dollars will not pay for sentiment. We would have Porto Rico Americanized just as fast as possible, enriched with agriculture and commerce, taught to put education before trade, given now individual citizenship, and later general citizenship, and then equal Statehood and left to care for itself as the rest of us do, taking its fair part in the support of the nation while providing for its own government and development.

## Chinese and Manchu

It is written in the Confucian Analects that the Master said: "What a superior man is Keu Pih-yuh! When good government prevails in his state he is to be found in office. When bad government prevails, he can roll up his principles and keep them in his bosom." Confucius would have found Yuan Shi-kai a man after his own heart. For three years now he has kept his principles rolled up in his bosom, silently waiting till the time should come when his country needed him again and recognized its need.

He was the right hand man of the Empress Dowager in the last years of her life when she was endeavoring to put into operation the reforms which she had once prevented. Among these reforms those most resented by her race were the edicts depriving the Manchus of their historic privileges and reducing them to an equality with the Chinese. Chinese were even appointed by her to the Grand Council, the ruling body of the empire, among them Yuan, who was also commander in chief of the imperial army. But when the Empress Dowager died in 1908 the reactionary party at Court seized the reins and endeavored to re-establish Manchu supremacy. The Chinese were practically eliminated from the Grand Council, and Yuan Shi-Kai was retired to private life, because, says the edict of the child emperor, he had rheumatism in the leg. This was a good reason at least so far as the military position was concerned. An American general afflicted with this painful infirmity would doubtless fail to pass the Rooseveltian riding test. But the edict concludes with the mysterious and suspicious words, "thus our clemency toward him is manifested." What "clemency"? For not compelling him to continue in the service when his leg hurt him? Or had he been guilty of more heinous but unmentioned crimes than getting rheumatism in the leg? Fortunately he was not so badly crippled but that he was able to get away from the capital in disguise and take refuge in the foreign concession at Tientsin, otherwise he would have got it in the neck.

Because he fought and ran away he lives to fight another day. That the Manchu princes who dismissed him and would have executed him have now called him back to take command of the army and offered him all the men and money he wants is the best evidence that they regard the rebellion as serious. Yuan Shi-Kai, in his reply, accepts the vice-royalty, but notifies the Government that his leg is as lame as ever and so he will not be able to take the field against the rebels. A second imperial edict orders him to get well quickly and get to work, but in the meantime, that is, during his convalescence, he remains at home, watching to see which way the cat is going to jump in the Yang-tse Valley. The forced concessions of the Manchus to the parliamentary party have aroused

the contempt rather than the gratitude of the Chinese. Never since they got on the inside of the Great Wall which was built to keep them out have they been less liked or less feared by the race they rule. The streets of Wu-chang are strewn with Manchu bodies, men, women and children. Some who tried to escape by putting on Chinese clothing were caught by their pronunciation. Their shibboleth was 6, and if they gave it the court pronunciation of *lu*, instead of the harsher *luk* current along the Yang-tse, off went their heads. So Jephthah, using a similar phonetic test, detected and put to death forty and two thousand Ephraimites. So, too, the Border Ruffians of Missouri kept the free-State men from entering Kansas by asking them to name the animal hitched to a post by the river. All who called it "keow" were turned back or otherwise disposed of.

Nearly two hundred years have gone by since the last Chinese emperor hanged himself on a tree in the palace garden at Peking, but the Manchus are still unassimilated; a ruling caste. This will not surprise us when we think that it was longer than that before Norman and Saxon were of one speech and one blood and called themselves Englishmen. Corresponding to the Norman castle that dominated every English town, we have the Tatar city which stands beside each Chinese capital. But the Manchus form only one or two per cent. of the population of the empire, and they have lost the military prowess by which they have dominated the peaceful Chinese. The only armies worth consideration are those which progressive Chinese like Yuan Shi-kai have armed and uniformed in Western fashion, "imitation foreign devils," the conservatives call them. The attitude of the Manchus toward the educational aspirations of the Chinese may be shown by quoting the words of Grand Councillor Kang Yi when he was promoting the Boxer movement:

"The establishment of schools and colleges has only encouraged Chinese ambitions and developed Chinese talent to the danger of the Manchu dynasty. The students should therefore be exterminated without delay."

But not having been exterminated in time, these students form the mainspring of the present insurgency, which differs from the Boxer rebellion in that it is inspired by progressive rather than reactionary ideals and is directed against the ruling dynasty rather than against the foreigners. It resembles more closely the Tai-ping rebellion of fifty years ago which the Manchus were able to suppress only by calling in the aid of American and English officers, Ward and Gordon. No doubt the Manchus would be willing now to sell out China to any foreign Power which would maintain them in their privileged position. We have in fact an explicit statement to that effect made not many years ago by Prince Chung, the favorite adviser of the Empress Dowager in her reactionary period, "It were better to hand over the empire to the foreign devils than to surrender it at the dictation of these Chinese rebels." It is greatly to be hoped that no foreign nation will yield to the temptation and take advantage of the crisis to interfere in behalf of the Manchu dynasty. Chinese Gordon was a conscientious man and influenced by the best of motives, but it seems to us now that in overthrowing the Tai-pings he set back the clock in China by many years.

## Obesity Cures

FASHION'S ultimate decree that the feminine human form divine shall look as much as possible like a pillar (not a pillow), without any notable projections in any part, has led to the making of determined efforts by a large number of women to bring their bodily perfections into something like consonance with the styles. As a consequence, any one who pays much attention, or, indeed, any attention, to the advertising columns of newspapers and magazines, will have noticed a large increase in the number of announcements of remedies and treatments of various kinds to reduce weight, take off fat, and give back that sylphlike slimness that is so much desired at the present time. Now, as is well known, advertising costs money and is not indulged in without result. It is even said that medical advertisements usually have to pay higher rates, in some cases double those of other advertising modes. In that case there

must be twice as much response to these "anti-fat" advertisements as to others to make them pay.

That this is the case and that a very large number of women have in the last year or two had recourse to such remedies seems to be true from the reports of certain interesting cases by physicians. Their patients come complaining of sleeplessness, nervousness, palpitation of the heart, gastric disturbances of various kinds, flushings and interference with heat regulation that gives them alternate chilly and febrile sensations. It was rather hard at first to recognize just what the source of these symptoms was, until inquiry elicited the fact that these patients were taking certain reduction remedies, advertised as "perfectly harmless" and as bringing about reduction in weight without the necessity for exercise, diet, or any other bothersome addenda. So many cases of this kind have been reported that physicians are now aroused as to the significance of the symptom complex and are likely to ask early in their elicitation of the history, especially if the patient shows some tendency to *embonpoint,* whether any reducing remedy is being taken.

The cause of the symptoms in question is easy to understand, once the principal ingredient of the modern advertised anti-fat remedies is known. The favorite ingredient twenty years ago in anti-fats used to be potassium iodide. That is one of the strongest drugs that we have for certain purposes. It brings about an absorption of tissues that are not well supplied with blood. All incompletely formed tissues are likely to be affected by it. Besides, it reduces appetite and interferes with internal nutrition to some extent, unless care is taken in the administration of it. In many cases this helped to bring about a reduction in weight, but it had serious dangers associated with it. It was likely to bring about absorption of certain forms of tissue that nature uses for protective purposes. For instance, after tuberculosis of the lungs, if a cure results, which happens in a great many cases, the tuberculous nodule in the lung is encased in a form of connective tissue that may under certain circumstances be disturbed by such a remedy as potassium iodide and be seriously interfered with by any rapid reduction in weight. As a consequence, reduction cures were sometimes followed by the lighting up of old tuberculous foci. As nearly every individual has at some time or other had a tuberculous infection, tho seven out of eight of us have sufficient immunity to prove refractory to the disease, it can be readily seen how dangerous was the old remedy for obesity.

The increase of our knowledge of the effect produced by thyroid extract, however, soon put this in the first place as an anti-fat. Its physiological action in reducing obesity is rather marked in many cases. Its general effect upon the system, however, is to highten nutritive processes, and so cause a need for even more food than usual. If this increased amount of food is not taken, the protein materials of the body and especially the muscles, including the heart, become wasted to a certain degree. This is what brings about the feeling of palpitation and the tremulousness and nervousness characteristic of these cases. It is probably also because of the disturbance of the muscular coats of the stomach and intestines that various symptoms due to these are also noted. As a writer in the *Journal of the American Medical Association* for October 14, 1911, pointed out, the use of thyroid in obesity is not only accompanied by a certain amount of danger, but it is in most cases an illogical treatment. Certainly no one who realizes how strong are the effects of thyroid would think for a moment of using it without being under the surveillance of some one who knows how to recognize its evil effects as soon as they begin. It is only certain cases of constitutional obesity that are benefited by it, and it is probable that patients of this kind would have to take the drug almost continuously for years to be benefited by it.

In Germany some years ago rather strict legal regulations were made for the sale of thyroid. It was very commonly said at the time that the reason for the enactment of these stringent regulations was that a certain number of the ladies of the court had had their health seriously disturbed by the taking of reduction cures containing thyroid

material. In Europe generally there is the feeling that in spite of its danger thyroid is used for this purpose, especially by irregular practitioners of medicine, and in proprietary preparations much more frequently and in larger doses than is safe. In this country the Government investigations connected with the pure food and drug law have shown that thyroid is an almost constant ingredient of the most advertised reduction cures.

Of course, so long as people will be foolish enough to think that advertised remedies, any more than advertised stocks or advertised investments that pay 10 per cent. a month or a week, are anything but obvious frauds and schemes to make money, because there are so many people ready to be humbugged, such dangers will continue to exist in our modern life. In the meantime, however, it may be as well to say that, except in certain cases of constitutional obesity which resemble diabetes, the fat and the sugar elements in the two cases being similarly subject to unfavorable metabolic processes, there are just two reasons for abnormal weight. One is eating too much and the other is taking too little exercise. The normal way to take fat off, then, is to eat less and to exercise more. Both of these prescriptions are needed in most cases and diet will not solve the problem alone and neither will exercise. When habits of overeating and underexercising have been formed it is hard to break them, but the satisfaction of the fuller life that comes with reduction in weight is ample compensation for the trouble involved. Gradual reduction in this way, instead of disturbing health, always improves it and adds to the patient's happiness and sense of well-being.

**Equal Pay for Teachers**

Hereafter in New York City women will receive the same pay as men for the same grade of work. The women teachers have for a long time been demanding it, and it is just that they should have it. This additional salary will, we are told, cost the city $3,500,000. It appears to us only right that a woman who does the same work as a man should receive a man's pay; and yet women have found positions in business because they are willing to accept reduced wages. If they do not accept reduced wages they will find fewer places to earn money in, for men will often be chosen at the same rate of wages in many kinds of work, and those positions will be left to women, as in lower grades of teaching, in which they can do better work than men. The natural result will be to reduce the number of wage-earning women and increase the demand for wage-earning men. This will find its compensation for women, however, in the long run, by enabling more men to marry and provide thus, in a legitimate and desirable way, for those women who have been forced out by masculine competition. It is an evil of our present system of society that so many men and women do not, and think they cannot, marry; and a chief cause has been the competition of women as wage-earners.

**The Indian Conference**

We have elsewhere spoken of the pleas for Porto Rican citizenship made by Porto Ricans at the Lake Mohonk Conference last week. The original purpose of these conferences was to consider the needs of the Indians, and it was only when the main principles of our Indian policy had been settled that the scope of the conference was enlarged to take in our new possessions. It is now settled that all Indians must be educated in the English language; that the distribution of rations must stop and Indians be expected to work and earn a living like the rest of us; that for this purpose the tribal system must be broken up, and the Indians must be settled each on his individual holding of land, and that they be incorporated as rapidly as possible into the general body politic. If we can judge from the feeling of the conference and from the platform adopted, it is likely to be a further policy to give citizenship to the Indian as soon as he receives his allotted land, so that as a voter he can protect himself. The Government Indian schools will be reduced and the Indian children put in the public schools of the States. It is also very desirable that as the tribal lands are divided up in sev-

eralty, so also the tribal funds be allotted and each Indian be given his portion as soon as can safely be done. In certain cases old Indian communities, like Pueblos and the Pimos of California and Arizona, who have for centuries lived by irrigation and agriculture, need special protection, because their rich lands are wanted by white settlers, and in the case of the Pimos their water has been diverted by those who have settled above them. We doubt not that the Indian Bureau will protect their rights, and if necessary give them from reservoirs other water to supply the loss. It was a pleasure to observe the genuine devotion of the Bureau to the task of civilization and the protection of Indian rights. This annual Indian conference has had profound influence in bringing together the friends of the Indian and influencing public opinion, and great thanks for it are due to Mr. Smiley, who entertains its members so generously.

**Baltimore's Celebration**

We are glad to say a word of recognition for the fiftieth anniversary of the ordination of Cardinal-Archbishop of Baltimore, and the twenty-fifth of his appointment as Cardinal. He is worthy, we doubt not, of all the praise he has received from Catholics and Protestants, from the highest in the State, and especially from his fellow citizens of Baltimore, who have made holiday for him. It is difficult for those outside of the Church, who have no esoteric knowledge, to judge of the character of the high dignitaries, for they receive unmeasured and indiscriminating eulogy from all the Catholic journals, and every one is a singing swan. As a somewhat surprising example we notice that a journal owned by another Archbishop gives to an editorial on the Cardinal's jubilee the title "The Cardinal's Apotheosis," a term almost blasphemous, such as might be applied to a Roman Emperor. This is a chief weakness of the Catholic press, its subservient adoration of its high ecclesiastics. They must require a peculiar grace to preserve their humility when no one dares criticise them, and every one bows or kneels before them and kisses their hand.

**Robbery by Public Servants**

The chairman of the Republican Campaign Committee of Philadelphia announced last week that Mr. Earle would not recommence his speechmaking until the world's baseball series was settled. It is not altogether strange if the success of her "Athletics" has somewhat gone to Philadelphia's head. Even in New York little has been heard of the county contests during the last fortnight. But to return to Philadelphia. Rudolph Blankenburg has not been inactive, baseball or no baseball, and neither has the Catlin Commission. Latterly this committee of the State Legislature has been revealing some of the crookedness in road jury awards. Here is what one of the more conservative Philadelphia newspapers reports of one day's testimony:

"The sum total of the day's testimony presented by experts and backed by documentary evidence showed that of thirty-three properties in the vicinity of Tyson street and Bustleton avenue the road jury cut into property aggregating 1,058 acres, assessed at $485,500, or about $460 dollars an acre. The city took twenty-eight acres out of these properties and paid $182,823, or at the rate of $7,000 an acre. . . . Further testimony showed that in the majority of cases the property was greatly enhanced in value by the cutting of the streets, but in no instance was this improvement considered by the road juries."

Republican politicians have profited by these scandals. Worst of all, the Attorney-General of Pennsylvania and the Assistant District Attorney for the Philadelphia district have been named as the lawyers who secured extortionate prices from the city for their clients. In the course of its brief life the Catlin Commission of the Pennsylvania Legislature has uncovered a festering mass of corruption only barely hinted at in this paragraph. We hope that it has authority to continue its investigation, to enforce the attendance and the testimony of witnesses, and, finally, to ensure criminal action against certain Philadelphia officials. This is not politics: only justice.

**American Millionaires and Art**

We do not quite like the slur and the sneer exprest in this quotation from Lord Curzon's address at an exhibition of old masters in London the other day:

"Unfortunately, England is not now the great buying country, but the great selling country—the happy hunting ground of the foreign connoisseur, and, above all, of the American millionaire. This is inevitable. Owing to the great growth of artistic perception and a sense of beauty here, our own galleries, as well as those on the Continent, are always competing for Old Masters, and as these are absorbed their price goes up. Whether the American millionaire's motives are personal and selfish or patriotic, his wealth makes him irresistible; while our capacity for resistance is diminished by the enormous burden of taxation levied by the State. One hundred thousand pounds is no uncommon price for a great picture now. It no longer gives us a shock to hear of a picture or castle about to be spirited away. And the situation will get worse. The number of available masterpieces is very restricted, while the purchasing power of the United States is likely to increase; and the American buyer is no longer satisfied, as he was 20 or 30 years ago, with the clever fakes now in the Metropolitan Museum and other New York collections."

Even the best guarded museums of Europe get caught at times. There have been famous frauds accepted by experts in the Louvre and the Berlin Museum, and the Metropolitan has not escaped. But our museum, like theirs, finds its fakes, withdraws them from exhibition and consigns them to the basement closets. It was not a pretty speech.

Bishop Gailor, of Tennessee, has lately given us this depressing view of the moral outlook:

"If the public schools are our only dependence for inculcating high moral ideals in the growing generation of voters in this country, the outlook is not encouraging."

But the good bishop ought not to forget that the public schools are not the only, nor the first, nor the second, in order of our dependences for inculcating high moral ideas in our children. That task properly belongs to the parents and to the Church, and they would do very wrong to turn it over to the public schools. It is the business of the public schools to teach chiefly the three R's and what goes with them, and moral ideas also as they must be inculcated incidentally in school or farm or factory.

Mr. William T. Stead has written a long letter to express his surprise that, under the provisions of the Conference of The Hague in 1907, Turkey has not appealed to the Hague International Bureau, declaring its readiness to leave to arbitration its difference with Italy; and he says that Italy could not decline to accept. We doubt it. This is a case of spoliation. It is not what is meant when the Hague Conference speaks of "a conflict between two Powers." A case like this was not in view at The Hague. It was not thought it could occur. Equally an ancient code provided no penalty for the assumed impossible crime of parricide.

There were several splendid processions on Columbus Day. In Boston the Holy Name Society had 20,000 men. The Knights of Columbus were 5,000 strong. The Catholic Italian societies, says *The Pilot*, "showed that the Catholic spirit guides the exiles from Italy," and it adds:

"More than 35,000 of the best men of Boston went forward, step by step, to manifest to half a million onlookers that Catholic manhood knows how to rejoice in the triumph of a fellow Catholic and glories in the flag of freedom."

After thus claiming that this is a specially Catholic holiday it complains that Protestants took no part in it.

In the line of economics we have had no achievement lately of more decided value than an experiment on the Lehigh Valley Railroad. Putting experts on the engine, with supervision, the result was that the amount of coal used between Buffalo and Jersey City amounted to 15 tons and 70 pounds; while the amount of coal usually consumed on this run is between 25 and 30 tons. Here is a saving of something less than one-half. If this is a fair measure, and railroad men say it is, then the saving to the United States would be over one-third of all the coal now used annually. Perhaps the waste in other directions is just as large proportionately.

A subscriber to THE INDEPENDENT, who writes from under the shadow of the Himalaya Mountains, gives us this information:

"In these high mountain fastnesses with all its freight expenses, the manager of our hotel can buy Standard American oil for less money than we can in New York; and we are tempted to add to the Beatitudes: Blessed be a tariff law that does not protect the American people, but does protect the poor suffering millionaire."

# Insurance

## The Sale of Stocks by Life Insurance Companies

While the New York insurance laws, which were enacted in 1906 as a direct result of the investigations into the business of life insurance in this State by the Armstrong Committee, were in the main wise, and while the influence of them has been found in most cases salutary, experience has shown that they were in several respects a little too drastic. They were enacted at a time of great popular resentment against the former methods of certain of the large companies, and it is quite natural that the pendulum should have swung a little too far to the extreme; consequently, the trend of recent legislative action has been somewhat corrective in character and has wisely moderated the force of some of the so called "Hughes laws."

The law prohibiting the purchase of stocks seems, on the whole, a wise one. While it is true that certain companies might have on their finance committees such able financiers that large profits might be made by the judicious purchase and sale of stocks, a law must be universal in its application, and it is equally true that the funds of other companies might be seriously jeopardized by unwise financiering. These funds are made up of the savings of the public and rightfully belong to the policyholders. They should be as conservatively handled as those of a savings bank, and stock manipulation should have no part in their care. Funds of this sort should not be used for business risks, for dabbling in corporate stocks or operating in real estate. They should be invested in the most conservative manner consistent with a fair earning percentage. They should be affected as little as possible by the ups and downs of the financial world.

That portion of the law which ordered the companies to sell all their stock holdings within five years is generally considered among life insurance officials to be retroactive and unconstitutional, for they claim that no legislature has the right to order a company to throw upon the market property which it has lawfully acquired, and the recent action of the State Legislature in extending the term of years from five to ten helps matters very little, because no great company owning enormous blocks of stocks in various railroad and trust companies could realize the proper market value on its securities so long as it is known that it had to dispose of them within a limited time. For instance, suppose an insurance company owned $15,000,000 worth of stock in a trust company whose total issue of stock is $25,000,000. If it were known that this insurance company had to dispose of this majority amount by a certain date, that fact would greatly depreciate the market value of all that stock and it would have to sell its holdings on a constantly falling scale, and, in all probability, as soon as all its stock had been marketed, the price per share would jump enormously, to the benefit of the purchaser and to the loss of the insurance company. Therefore, the New York companies are dissatisfied with the recent legislative action, which merely extends the limit of time, and they claim that if this law is finally enforced it would be a very great loss to the policyholders of the companies affected.

The life insurance companies have never objected to selling their stocks, but they do and naturally object to being ordered to dump them upon the market within a stated period. Since this law was enacted the larger New York companies have shown their good faith by disposing of their stock holdings whenever they could do so at an advantage, but they have quite as consistently refrained from selling their stocks at a loss. The present market value of many stocks has been deprest by the existence of this law, and while the fixt time limit holds it is not probable that their proper market value will be obtainable.

The home of an Indianapolis man burned recently, causing a loss of about $3,000. The house caught fire in less than two hours after the agent had been refused a renewal of the insurance.

# Financial

## Steel Corporation's Ore Lease

THE market for securities was affected last week by the announcement that the Steel Corporation had decided to give up its lease of the Great Northern iron ore properties. Trading in Steel shares was more than one-third of the week's business on the Stock Exchange; transactions in Steel, Union Pacific and Reading amounted to 65 per cent. of the total. In the leading stocks there was a recovery of about 2 points from the low prices which followed the announcement, and the net loss for the week was small.

This ore lease cannot be canceled until January 1, 1915, and the Corporation's notice of withdrawal cannot be officially considered until January 1, 1913. It may fairly be assumed that the Corporation has decided at this early day to give the required notice, and to permit its decision to be known to the public, for two reasons. The first is, that in this way it meets the criticism of the Government, criticism which may indicate ground for a suit under the Anti-Trust law. The second is, that the Corporation desires to withdraw from a bad bargain. In his report on the Steel Corporation, Commissioner Herbert Knox Smith said:

"In so far as the Steel Corporation's position in the entire iron and steel industry is of monopolistic character, it is chiefly thru its control of ore holdings and the transportation of ore."

Reference was here made not only to ore but also to the ore-carrying railroads which the Corporation owns. It is understood that the freight rates on these roads will soon be reduced by 20 per cent. With regard to the second reason it may be said that the ore contract is not a profitable one for the company, which was required to mine and pay for 750,000 tons the first year (1907), and to increase the quantity by 750,000 tons each year thereafter until 1918. It bound itself to pay for these quantities whether it mined them or not. We understand that it mined and shipped in the first four years less than 2,500,000 tons, altho it paid for 7,500,000. It has expended about $15,000,000 for preliminary work in the ore field. The contract price is high, and ore prices will probably decline. The average of steel prices now is at the lowest figures reached since the Corporation was formed. The tariff prospect is not favorable. Moreover, since the lease was made the Corporation has acquired the ore holdings of the Tennessee Coal and Iron Company.

It appears, therefore, that the Steel Corporation has made a wise decision, both on account of official complaints which might be the basis of a Government suit, and because of the burdensome and unprofitable requirements of the lease.

*

....Slason Thompson's compilation of official reports covering 241,569 miles of railroad in this country for the year ending with June last shows that, while gross revenue was increased by $29,205,468, expenses were increased by $87,603,983, and net earnings reduced by $58,398,515.

....The Gotham National Bank, which is a little more than one year old, was recently appointed a Government depository for postal savings funds and has been made an associate member of the New York Clearing House Association. Zoheth S. Freeman, vice-president of the Liberty National Bank, has been elected a member of the Gotham's board of directors.

....Large growth of the country's banking business during the past year is indicated by reports to the Comptroller of the Currency, which show that on June 7 the total resources of the banks of the United States were more than $23,631,500,000, the increase in twelve months having been $1,181,200,000, or 5¼ per cent. The number of banks reporting was 24,371, or more by 1,276 than the number from which statements were received a year ago.

VOL. LXXI NEW YORK, THURSDAY, NOVEMBER 2, 1911 No. 3283

## Survey of the World

**Government Sues the Steel Corporation**

The Government brought suit against the United States Steel Corporation in the Federal Circuit Court at Trenton, N. J., on October 26, when a petition asking for dissolution of the company was filed, under the direction of Attorney-General Wickersham, with whom Jacob M. Dickinson, formerly Secretary of War, was associated as special counsel. The news caused some surprise, because on October 8 Mr. Wickersham authorized the statement that there was absolutely no truth in a report that the Government was about to sue the Corporation or was getting ready to sue. On the same day, and two or three hours before action was taken at Trenton, the Corporation's directors, at a special meeting, voted to give notice that it would cancel the Great Northern ore lease on January 1, 1915, and to reduce ore freight rates on its railroads in the Northwest by 25 per cent. The individual defendants in the suit are as follows:

J. Pierpont Morgan, John D. Rockefeller, Andrew Carnegie, Henry C. Frick, George W. Perkins, E. H. Gary, Charles M. Schwab, John D. Rockefeller, Jr., Charles Steele, James Gayley, William H. Moore, J. H. Moore, Edmund C. Converse, Percival Roberts, Jr., Daniel G. Reid, Norman B. Ream, P. A. B. Widener, William P. Palmer.

Other defendants are the Corporation itself, its seventeen leading constituent companies, and twenty subsidiaries. The court is asked to say that all the defendants are violating the law; to restrain them perpetually by injunction; to order a dissolution of the company, its constituent companies, and the companies of which they were made; to declare the ore lease illegal and to cancel it. The petition is very long. A summary of it fills a page of a newspaper. It gives a history of the Corporation, asserting that Judge Gary and Mr. Frick misrepresented the situation and misled President Roosevelt when they sought his permission to acquire the properties of the Tennessee Coal and Iron Company. There are indications that much of the petition was suggested by the proceedings of the Stanley committee, which represents the Democratic majority in the House. On the 27th, Judge Gary, chairman of the Corporation's board, published a brief statement. He believed, he said, that a disclosure of all the facts would show that the suit ought to be decided in favor of the Corporation on its merits, and that the following facts would be established:

"1. That in the organization of the United States Steel Corporation those in charge had no intention of forming a monopoly or of restraining trade.

"2. That the corporation never has had, or attempted to exercise, a monopoly or to restrain trade.

"3. That the conduct of the affairs of the corporation has clearly and positively negatived any effort or intention to violate any provision of the Sherman law.

"4. That the existence of the corporation has been of benefit, and not of injury, to its employes, its customers, its competitors and the general public.

"5. That no misrepresentation was made to the President relative to the Tennessee Coal and Iron properties, and that the motive of those connected with the purchase was to prevent a threatened general financial disaster which would have adversely affected the corporation as well as others."

In a speech at Chicago, on the 27th, Mr. Taft denied with emphasis that in its trust suits the Administration was influenced by political motives, adding that he would rather cut off his right hand than "do anything to disturb the business of the country, especially with a motive of cultivating political success." Mr.

Bryan says he is glad to see the suit be[illegible] left remarks also that the character [illegible] shows either that the President knew the Sherman act is worthless as a criminal law, or that he does not want to punish big criminals." The purpose of the Supreme Court's recent decisions, he adds, was to make it "impossible to punish trust magnates criminally," and "the court was packed to secure such decisions."

**The President on the Courts**

Addressing the Bar Association at Chicago on Saturday, Mr. Taft asked if it was necessary to argue the recall of the judiciary before them. There came back a deafening "No!" from the thousand lawyers in the room. The President therefore applied his time to a discussion of reform of judicial procedure. He said, in part:

"I sometimes feel that those who oppose the present society, Socialists and anarchists, and those who belong to the party of general discontent, ought to employ lawyers to find out the real causes they complain against in existing society, for it seems to me that in their selection of complaints they make great mistakes.

"If they were to attack our judiciary system on the ground that it failed to do justice by reason of the delays in justice, and thus errs in favor of the rich, who are able to stand the delay, while the poor cannot, they would have a just basis for complaint.

"And therefore those of us that believe in existing society and our present institutions and our continued maintenance of them owe it to ourselves and society to use every effort to simplify the judiciary procedure, to make it as inexpensive as possible, and to put on a dead level of equality the rich litigant and the poor litigant when they come together into court.

"Hence it seems to me of the utmost importance that all members of the bar should put their shoulders together to help out the Supreme Court of the United States in its present effort to simplify the equity procedure of that court.

"If that effort be successful I have every hope that Congress will introduce to the court the power to amend the law rules of the legal procedure in the Federal courts, as they have in England, and that then with that as a model everything can be improved the country over."

**Cuba and Other Islands**

More evidence tending to prove that the battleship "Maine" was wrecked by a mine on the port side has been found by the excavators. The magazines, boilers (found intact) and coal bunkers were blown to starboard, and a bulkhead at the point where the force exerted from without was greatest was blown inward. Cuba's Supreme Court has affirmed the constitutionality of the valuable concession recently granted to the Ports Improvement Company, one of whose contractors is M. J. Dady, of New York.——Reports from Jamaica say that there is soon to be another revolution in Hayti, promoted by those who went into exile when President Simon was overthrown, a few months ago, by General Leconte.——General Morales, formerly President of Santo Domingo, who was indicted in Porto Rico for inciting an insurrection in his country, has been acquitted by a Porto Rican court. ——Some months ago the Bahama Islands petitioned the British Government for annexation to Canada. The project was opposed by Premier Laurier. It has now been laid before the Borden Government at Ottawa, where the Governor General of the Bahamas was recently in conference with the new Premier concerning it.——Owing to the work of the Department of Agriculture in connection with an experiment station established in Guam, it is said that the beef, pork and poultry consumed on the island will be produced there. Such supplies have heretofore been brought from San Francisco, a distance of 5,500 miles.

**Madero and the Zapatists**

The unchecked hostile movement of Zapata in the vicinity of Mexico's capital, last week, caused much alarm in the city and its suburbs. It also brought discredit upon Madero and led to the enforced resignation of three members of the Cabinet. Zapata had almost undisputed control of four States. On the 25th, his bandit army sacked and burned the small city of Milpa Alta, only 25 miles from the capital, and the flames were seen from the capital's cathedral towers. Xochimilco, also near at hand, was menaced, and the residents fled to the capital, with which Xochimilco is connected by a trolley line. The Government's troops, attacking Zapata at Milpa Alta, were defeated, and one battalion was almost wiped out. It was said that

Zapata could muster 8,000 men. That night there was tumult in Congress, where by resolution the War and Interior Ministers were asked to explain why the Zapatists had not been suppressed. Circulars attacking Madero were distributed, and there were cheers for Diaz. The Ministers' replies were not satisfactory. In them were innuendoes against the Madero-De la Barra Government. De la Barra himself said his orders had not been obeyed by the Minister of War. It was suspected that Madero had an understanding with Zapata. The newspapers asserted that the suspicion was well founded. One of the Ministers had said sarcastically that Zapata would be suppressed soon after Madero's inauguration. A telegram to Madero, then in the north, brought this reply:

"It is not true that I have hampered the operations of the Federal forces. I did what I could to get Zapata to lay down his arms, but he refused to do this until I should come into power. He fears that the Government will not keep any agreement made with him, because the terms which, when I saw him, I told him the Government would grant were not afterward observed."

In another telegram he accused the Government of violating pledges which it had authorized him to give to Zapata. On the 27th, Salas, Minister of War; Granados, Minister of the Interior, and Dr. Gomez, Minister of Education, resigned by request. Zapata had been boasting that Madero would not permit the army to attack him vigorously. The troops moving against him were commanded by Figueroa, who had been associated with him in the revolution.——A man who attempted to assassinate Madero in Monterey has been sent to prison.——There have been many rumors about an uprising in favor of General Reyes, but they appear to have been baseless. It is said that a Reyes club in Paris has raised $2,000,000 for such a movement.

**South and Central America**

Dr. Alejandro Rivas Vasquez, formerly a member of Castro's Cabinet in Venezuela, and for some months past the head of a revolutionary junta in New York, sailed from Colon last week for Trinidad, intending there to cause a revolution for the overthrow of President Gomez. In Panama he said he had obtained in New York $2,000,000 for the movement, which, he asserted, would not be in the interest of Castro. A long statement from him has been published. Gomez's conduct while he was provisional President, Vasquez says, was good, but it became bad after his election for a four years' term. He then, Vasquez continues, associated with himself the worst of Castro's followers and set out to gain riches by means of monopolies and broad concessions, suppressing opposition by the imprisonment of critics. One of the concessions grants a monopoly of the coasting trade and of river and lake navigation. Vasquez asserts that he will have the aid of four-fifths of Venezuela's people.——There is danger of war between Chili and Peru. Chili has bought back the two large battleships which she sold, before they were finished, to Great Britain, has ordered another, and is sending troops to the northern frontier. The movement is due to the old controversy about Tacna and Arica, and to an unwise speech recently made by Peru's President. Chili says she does not intend to fight, but that she learned that Peru was quietly sending 15,000 troops to Tacna, where the Chilian garrison was only 150. It is said that Colombia, Ecuador and Bolivia would assist Chili if there should be war. Colombia has apologized to Peru for the assault upon Peru's Legation at Bogota, and Peru will return the arms taken from Colombian troops at a frontier post in disputed territory.——There were arrests at Quito, last week, following the discovery of a plot for the assassination of President Estrada.——It is reported that Uruguay is about to increase largely the tax on insurance companies, and thus to prepare the way for a Government monopoly of insurance.——There has been an uprising in Honduras, and several men have been killed in skirmishes between the Government troops and the insurgents.——At Guatemala's capital, last week, there was a convention of Central American journalists, who sought to bring about a closer union of the newspapers and also to promote a union or confederation of the five republics.

**Canada**

The Royal Colonial Institute entertained Earl Grey at a banquet in London, October 24, on the expiration of his term of office as Governor-General of Canada. The Colonial Secretary, the Right Hon. Lewis Harcourt, M. P., exprest his desire to render thanks to Sir Wilfrid Laurier for the great services he had rendered to the Dominion. He also said that it was no reflection upon the new Governor-General to add that Canada would gladly have seen Earl Grey's governorship indefinitely prolonged. Apart from administrative, military and naval progress, the last five years had been marked by the negotiation of a series of treaties and arrangements of the highest value to Canada in assuring amicable relations with the United States. "I do not refer to the recent reciprocity proposals," said Mr. Harcourt:

"I have in mind other agreements which in public estimation have been overshadowed by these proposals. Practically every outstanding question between Canada and the United States has either been settled or placed in the way of settlement."

Earl Grey himself received an ovation from the 300 diners. He also abstained from expressing himself on reciprocity. He said:

"I can say, however, with the greatest confidence that with the exception of an occasional crank here or there it is impossible to find an annexationist thruout the whole of Canada." (Cheers.)

"I say with equal confidence that, notwithstanding some desire to the contrary, there is no expectation in Canada that the recent Canadian elections should be used for inducing any change into the tariffs of the United Kingdom. In justice to Sir Wilfrid Laurier," the former Governor-General continued, "my affection and admiration for that distinguished statesman require me to say that he and his Government were actuated by no annexation sentiment. Sir Wilfrid was fully persuaded that his policy would strengthen both Canada and the Crown." Such a declaration, tho it wants novelty, is of significance, emanating from such a source, and is a flat denial of the Conservative party's campaign allegations, that were swallowed whole in Canada. ——Week before last there was held in Chelsea Town Hall, London, the first public meeting ever called to celebrate the result of an over-seas election. The innovation is credited to the more aggressive spirits within the Conservative party, and the meeting exploited the Canadian elections in the interests of that party in England. Earl Grey's pronouncement was, perhaps, evoked by the speeches made at Plymouth, where the utterances of American politicians—notably Mr. Taft's "parting of the ways" speech—were cited as evidences that the Dominion election was a test of "loyalty." The Canadian Conservatives have, said Earl Stanhope, the chairman of the meeting, a leader of unbounded courage and energy, who spoke to no uncertain purport. The audience caught the meaning of this allusion—a cut at Mr. Balfour's leadership of the British Conservatives. Other speakers, Lord Willoughby de Broke and Mr. Page Croft, M. P., carefully abstained from direct attack upon Mr. Balfour, but their remarks were interrupted by cries of "Shift Balfour!" and "Get Arthur Balfour out of the way!" The editor of the *National Review,* Mr. Leo Maxse, the next speaker, on the other hand, omitted Canada from his speech, and let the cat out of the bag in making a bitter attack upon Mr. Balfour's leadership.

**British Politics**

Parliament opened on October 24 after the summer recess, and Premier Asquith outlined the program for the session of forty days. It is announced that the Workingmen's Insurance Bill will be passed before Christmas, and for its discussion eighteen days has been allotted. Mr. Balfour, as leader of the Opposition, protested both against taking up so large a proportion of the time of the session with one bill, and also against rushing thru so important and difficult a measure without more thoro consideration than can be given to it in this session. There is little doubt that the bill will be carried in spite of the strong opposition which it has aroused in various quarters.—— Many changes have been made in the Cabinet. Winston Churchill, of the

Home Office, exchanges his place with Reginald McKenna as Lord of the Admiralty. Walter Runciman is transferred from the Board of Education to the Department of Agriculture, taking the place of Earl Carrington, who becomes Lord of the Privy Seal, while Joseph Albert Pease, now Chancellor of the Duchy of Lancaster, is placed at the head of the Board of Education. The old place occupied by Pease goes to Charles Edward Henry Hobhouse. The removal of Mr. Runciman from the Board of Education is perhaps due to the criticism to which he has been subject on account of the circular issued by one of the subordinates in his department, advising that inspectors of the schools be chosen from those who have been educated at such schools as Eton and Rugby and such universities as Oxford and Cambridge, rather than from those trained in the state schools. Mr. Churchill has been very unpopular as Home Secretary, but why he should be willing to accept a post of lower rank with a salary of $2,500 less is not understood by the public. It is rumored that Mr. Asquith will before long go into the House of Lords and that Mr. Lloyd George will succeed him as Premier.

**The Invasion of Tripoli**

Notwithstanding the rumors that the Italian Government intends to make a naval demonstration in the Dardanelles or seize some Turkish islands in the Aegean Sea, the war has been confined to Africa, where, however, the Italians have been hard prest. The Arabs are making common cause with the Turks, and last week they made repeated and desperate attempts to recover the city of Tripoli. The Italian lines form a semi-circle around the city, with the ends resting upon the sea on both sides. Heavy seas compelled the withdrawal of the Italian fleet with the exception of two vessels, and the enemy, taking advantage of this occasion, renewed their attacks day after day. The most severe was on October 26, when an attempt was made to surprise the garrison by a cavalry attack all along the line before daybreak. This was repulsed, but later, under the pretense of concentrating upon an attack of the Italian right, the lines on the left were driven in by a strong force of cavalry and infantry. The hand-to-hand fighting in the trenches was severe, and for a time it seemed as tho the Italians must give way, but they rallied and drove back the enemy with heavy loss. One party of 500 Arabs was surrounded and ordered to surrender, and when they did not comply the Italians opened fire upon them with a Hotchkiss gun captured from the barracks and killed 300 of them. The fiercest struggle occurred over a green banner which was captured by the Eighty-fourth Italian Infantry after its defenders had been almost annihilated. The Italian aeroplanes, sallying out from the city, reported the attacking force to number more than 6,000. According to the official report, the Arabs and Turks lost more than a thousand killed, while the Italian loss was about a tenth of that number. There is a wide discrepancy between the official and censored dispatches, and the reports which leak out from Tunis and Egypt, the latter reporting the Italian garrison in desperate straits and suffering heavily from the besieging enemy and from cholera in the camp. The Arabs in the city rose in support of the attack, burning buildings and firing from the roofs of houses on the Italians in the streets. The Italian Government treats as rebels all Arabs found with arms in their hands and suspected of opposing the Italian occupation. Two thousand Arabs have been arrested on this ground in Tripoli, and a large number of them were condemned by court martial and publicly shot in groups of six as a warning to the natives.——It is reported that Envers Bey, the leader of the Young Turks, has made his way into the hinterland of Tripoli by camel caravan from Egypt, and is in consultation with the grand master of the Brotherhood of the Senussiyeh, Ahmed-el-Sherif, at Jof, in the Oasis of Kufra. The Senussiyeh is a Mohammedan military and monastic order somewhat resembling in its organization the Christian Knights Templar. The membership thru the Mohammedan world numbers several million, and if the Senussi should organize a holy war

against the Italians, it would be a serious matter

**The Chinese Rebellion**

Successes are reported from both sides during the week. On one hand the revolutionists have gained ground in the Yang-tse Valley, as city after city has declared against the Imperial Government with little or no bloodshed and disorder. On the other hand, the imperialists have attained a great triumph in the recapture of the city of Han-kow. This is one of the group of three cities which form the center of the revolutionary movement. As may be seen from

MAP OF CHINA

The names of cities reported to be held by the revolutionists are underlined

the accompanying map, these cities lie at the junction of the Han and the Yang-tse rivers; Wu-chang, the old, fortified capital of the viceroyalty; Han-yang, the manufacturing center, containing the most important arsenal of the empire and extensive steel and iron works, and Han-kow, the commercial town, with the concessions of England, Russia, France, Germany and Japan, along the bank of the Yang-tse. Han-kow is the terminus of the railroad from Peking, and this victory will presumably enable Yuan Shi-kai to send troops into the heart of the disaffected district. Reports are conflicting as to the details of the engagement. Some say that the rebels, according to a prearranged agreement with the imperialists, withdrew across the Han into Han-kow without a contest. Others say that they fought like demons and lost 3,000 men killed and thousands more wounded. The Chinese gunboats under Admiral Sah came up the Yang-tse from Kiu-kiang and assisted the land troops by delivering a flanking fire.——The city of Canton is turning toward the revolutionary party. The demand of the imperial Government for a special contribution to the war fund was refused by the Viceroy in accordance with the decision exprest at a meeting of the gentry. The newly appointed Tatar general, Feng Shan, on his arrival at Canton was assassinated as he was passing thru the streets. Bombs thrown from the roofs of the houses into the midst of his bodyguard killed also twenty of the soldiers. The man who threw the bomb was fatally wounded.——The National Assembly (Tsu-Cheng-Yuan), now in session at Peking, has boldly espoused the cause of the reformers, tho avoiding any attack upon the Manchu dynasty. It has won its first battle by securing the dismissal of Sheng Hsuan-huai, Minister of Posts and Communications, for negotiating the foreign loans which precipitated the insurrection. The members who brought forward the charges against him stated that they were not opposed to foreign loans, but that Sheng had robbed the people by taking over railroads already under construction by native companies and selling them to foreign capitalists. The accused minister did not appear, and when his secretary attempted to read a defense of his policy his voice was drowned out by cries of "Off with Sheng's head." When the resolution was put to a vote not even the Manchu princes on the front benches ventured to favor it. The imperial edict carrying into effect this resolution reads as follows:

"In his policy regarding the nationalization of the railways Shêng failed to appreciate the intentions of the Throne and made many blunders. He received our high favor, but jeopardized the situation by self-interested conduct. Unfaithful to his trust, Shêng is cashiered, never to be employed again."

The deposed minister was escorted to Tien-tsin by a guard of soldiers from the American, British, German and French legations to protect him from the vengeance of the mob. The Assembly also passed resolutions demanding that the Premier, Prince Ching, and his two assistants appear before an investigating board to answer to the charges of mismanagement of affairs causing the present rebellion, and that the president and members of the Provincial Assembly of Sze-chuan, who are now in prison for inciting the rising in that province, be at once released, and past and present viceroys of Sze-chuan be prosecuted. The Government issued edicts accordingly. The Assembly insisted upon having a constitutional government established without delay, and the second army, now on the Yellow River, refused to go to the front, and the navy threatened to mutiny unless this demand was conceded. This also was conceded and an edict issued providing for the immediate establishment of a responsible Government, from which the Manchu nobles will be excluded. Full amnesty is offered to political offenders.

*

**The Personal Element**

Political struggles such as are now going on in China are not mere conflicts of abstract principles, geographical entities or social classes. They are largely determined by individual motives and idiosyncrasies so to get an understanding of the Chinese situation it is necessary to know something of the personalities who

are taking part in this great drama. Of these the most conspicuous is Yuan Shi Kai, now virtually dictator of the empire, in supreme control not only of the army, but of the policy of the Government in relation to the insurgents. He is doubtless better known to the outside world than any other Chinese, for he has been prominent in international affairs ever since 1894, when he was Minister to Korea, and on the approach of the Japanese army to Seoul escaped to the sea under guard of British bluejackets. Editorials on his character and career will be found in THE INDEPENDENT of this week and last week.——Tang Shao-yi is also well known in this country, as he was a student at Yale and visited this country a year ago on his tour of the world to thank our Government for the remission of the unappropriated portion of the Boxer indemnity. He is a protégé of Yuan and shared in recent years his ups and down of fortune. He now enters the Cabinet as Minister of Posts and Communication in place of Sheng, dismissed in disgrace at the dictation of the Assembly.——Tsao Sze, newly appointed Minister of the United States, went to the public schools in Washington, graduated from the Central High School of that city, and from Cornell University in 1901. He assisted Professor Jenks, of Cornell, in devising a plan for the reform of the financial system of the Chinese Empire, and now holds the position of deputy vice-president of the Wai-wu-pu, or Foreign Office, at Peking. He is only thirty-six years old.——Yin-chang, who, as Minister of War, has been conducting operations against the rebels, is a Manchu of about fifty-five years of age. He received his military education in Austria and has three times served as Minister to Germany. He reorganized and directed the military school of Tien-tsin and assisted Yuan Shi-Kai in the creation of a modern army. There has been considerable rivalry and enmity between the two men, and now that Yuan has control of the army Yin may be removed. The troops under him consist of two divisions, one of his own Manchus and one of Yuan's Chinese, and they have often come into conflict in past years.——The leader of the rebels, who proclaims himself President of the Chinese Republic, is Li Yuan-Hung, a native of the Hu-peh Province, forty-eight years old. He was educated at Tien-tsin and has resided in England. Most of his service has been in the navy, but he was in command of the Twenty-first Mixed Brigade at Hankow when he revolted. The outbreak was in large part due to personal jealousy between him and Chang Piao, recently appointed commander-in-chief of the garrison of the Hu-peh Province. General Li was very popular, and the young officers who had been educated in Europe and America flocked to his standard, despising General Chang for his antiquated ideas and humble birth. Chang Piao had been a servant of the great Viceroy Chang Chi-tung, author of "China's Only Hope," which has sold by the million in China and has been more widely read in this country than any other modern Chinese book. Thru the patronage of the great Viceroy he entered the army and was rapidly promoted. He was brutal in discipline, striking and even wounding his soldiers. The officers of his clan followed his example, and not long ago a cavalry general inflicted a mortal wound upon a soldier. That evening the home of the general was invaded by bandits, who stole his money and insulted his women. Warned by a telephone message from his secretary the general galloped to his house with his troop and arrived in time to capture some of the bandits, who were found to be soldiers from the company of the murdered man, determined to avenge his death. Viceroy Sui Cheng ordered them executed, which further increased the hatred felt for the Viceroy and the commander-in-chief among the troops. The revolutionary movement spread among the officers and men and when the Viceroy beheaded in the street the members of a revolutionary club the troops of General Li mutinied and the Viceroy and General Chang had to flee for their lives. They were dismissed from the service in disgrace and sentenced to death for cowardice by imperial edict, which, somewhat inconsistently, ordered them to return to their posts and retrieve their reputations. General Cheng is reported to have committed suicide.

# Democratic Presidential Possibilities

In THE INDEPENDENT of October 15, 1908, a unique journalistic feat was accomplished by securing signed articles from the six Presidential candidates, giving the appeal of their parties to the nation. The contributors were William H. Taft, William J. Bryan, Eugene V. Debs, Eugene H. Chapin, Thomas E. Watson, Thomas S. Hisgen and August Gilhaus. In this issue we present to our readers the three foremost Democratic candidates for the Presidency of the United States, and have asked three different men, who are well qualified for the task, to write about the life and work of each candidate. Colonel Harvey, who discusses Governor Wilson, is the distinguished editor of *Harper's Weekly*. He has been at different times connected with the Springfield *Republican*, the Chicago *News* and the New York *World*. He was colonel on the staff of Governor Green and Governor Abbett, of New Jersey, and has been closely identified with recent progressive political movements. Congressman Cox, who has written on Governor Harmon, is Representative at Washington from the Third Ohio District. He is also a journalist, having been connected with the Cincinnati *Enquirer*, the Dayton *Daily News* and the Springfield *Press-Republic*. He is a close personal friend of Governor Harmon. Colonel Graves, who advocates the nomination of Speaker Clark, is editor-in-chief of the New York *American*. He was before that editor of the *Daily Florida Union*, the Atlanta *Daily Journal* and the Atlanta *Daily Georgian*. He was a candidate for United States Senator from Georgia in 1905, but withdrew. He has a wide reputation as a forceful writer and an eloquent speaker. We believe our readers will be interested to weigh in the balance of their judgment the arguments that these three able writers present.—EDITOR.

## I—Governor Woodrow Wilson

BY COL. GEORGE HARVEY

EDITOR OF "HARPER'S WEEKLY"

THERE are many reasons why the Democratic party would do well to nominate Woodrow Wilson for President. I shall set forth a few.

*Because he is thoroly equipped, mentally and morally, by birth, training and experience.*

A good inheritance from a virile ancestry is a great help to one who has to make his way in the world. Money has its uses in this country. Titles are not to be despised in other lands. Good breeding is desirable everywhere. Far more valuable than all combined are the attributes which crystallize into character. These constituted Wilson's heritage. The Scotch-Irish stock from which he sprang has produced the best type of American. Brains, conscience, convictions, he inherited. Character he developed under the tutelage of the scholarly divine who was his father.

Thence forward to this day Woodrow Wilson has been fitting himself for public service. Political economy was the passion of his youth. "The facts of government," using his own accurately discriminative phrase, became the dominant interest of his mind. He mastered theories and studied the results of practice. He longed to enter public life and work out political problems at close range. The legal profession seemed to provide an avenue, and he obtained admission to the bar. But he continued to study and to learn thru teaching.

It is not needful to mark the successive steps in the unaided advancement of the poor minister's son to the presidency of a great university. The progress was steady and sure, because it was based upon intelligence and industry.

Intelligence of the highest and rarest is peculiarly essential in a President at this time. And such is the order of Wilson's. His sense is anything but

GOVERNOR WOODROW WILSON OF NEW JERSEY

Dr. Wilson is an example of the Scholar in Politics. He was first mentioned as a possibility for Vice President on the ticket with Governor Harmon, but recently there has been quite as much talk of the same ticket with the names reversed.

common; it is most uncommon—keen, searching, penetrating, going straight to the root of difficulty, intent upon finding, not a palliative, but a cure. In his case to a notable degree felicity of expression rests upon facility of thought. Wilson is not an orator in the accepted meaning of the term. He does not utilize sound in public speaking. His phrases are not rounded for purely rhetorical effect, and he never declaims. Yet no American now living can hold the attention of an audience so closely. The reason is simple. He seeks the understanding rather than the admiration of his hearers. Each word conveys a definite meaning, each is selected with precision, and each finds its rightful place. His eloquence is knowledge, not art, and its convincingness lies in its simplicity. The auditor feels that a conclusion wrought by processes of logic is the basis of the utterance. And the intuition is correct. Wilson invariably has a reason for an opinion, and always has it ready for use. Altho positive, he is never didactic. Telling why he thinks as he does is what gives himself no less than his hearer the greatest pleasure and satisfaction. That Wilson has wider information respecting theories of government than another or perhaps any other, is not surprising. All his life has been given to its acquisition. But it is not enough to possess knowledge. One must be able to impart and elucidate its lessons. And, thanks to his experience as a teacher, few will deny that in this respect Wilson was not excelled even by Madison or by Hamilton, and stands today actually pre-eminent.

*Because his conception of public service is true.*

But is he "sound"? Are not his proposals "radical"? What about his advocacy of "referendum" and "recall"? Let us see. We are now weighing the relative merits of candidates for the Democratic nomination for President. It may be well, then, to note at the beginning that each and every statesman whose name has been mentioned in this connection has pronounced in favor of the Swiss method of assuring popular government. There is consequently no point at issue as between them here, except in so far as Wilson would restrict its adoption sharply to the obvious and pressing need of a community.

He upholds the referendum and recall, not as a *substitute for,* but as a *guarantee of,* truly representative government. It is "the gun behind the door," to be used only in extreme cases against those who have betrayed their trust and violated their pledges.

It is as "a method of action," not as a fundamental change, in a government of delegated powers that Wilson supports the referendum and recall, and even so draws a sharp line between administration and interpretation of laws. Speaking in the heart of the section whose people, not without cause, distrust machine-made and corporation-made judges and feel the need of direct control over them, Governor Wilson said positively:

"That is all wrong. Judges are not lawmakers. Neither are they administrators. Their duty is to determine not what the law should be, but what the law is. It is of the first consequence that their sense of freedom should be unhampered and preserved."

"But," he was asked, subsequently, "if a judge misuses his office to serve a man like Lorimer, should not the people have the means to recall him?"

"I cannot," he replied, "bring myself to further dangerous impatience. It is only a matter of waiting in the case of elective judges. The remedy comes at the end of their terms of office. But to apply to judges the principle of the recall is to set up the idea that determinations of what the law *is* must respond to popular impulse and to popular judgment. No, no; that is all wrong. I do *not* believe in the recall of judges."

Here we have the blending of positive conviction and intelligent discrimination characteristic of the man—the reasons why, simple, lucid, convincing, conclusive. Whether a like distinction is held in mental reserve by candidates who commend in general terms the referendum and recall will doubtless be made manifest in course of time. Caution invariably awaits revelation of the effects of frankness.

*Because his proposals are radical.*

To free the people by restoring to them the power of governing themselves is the first and dominant article in the creed of Woodrow Wilson. Not that

they are now deprived of that prerogative, as might have happened thru substitution of a monarchical form of government. Nothing so obvious as that. Only this: that the process has been rendered so difficult that, instead of governing themselves, the many have come under the dominance of the few, who act by indirection and under cover of the darkness of secrecy to achieve their own purposes. Whether or not this is the actual condition may be a matter of opinion, but to those who have watched and analyzed the work of State legislatures, and more particularly that of the Federal Congress with respect to the tariff, it seems a patent fact. Moreover, the constant unrest of the masses during recent years bears evidence of their feeling that the road to effective legislation has been made too tortuous to tread.

Wilson says: Open an avenue thru the jungle.

But how? By direct primaries for all elective offices, President and Vice-President included. By popular election of Senators. By open conventions, caucuses and committees. By legislation in the full light of day. By full discussion of measures before the faces of the people. *If and when necessary,* by Initiative, Referendum and Recall.

These are the means proposed. They are radical because they involve change. *But the purpose aimed at is conservative*—conservative of republican institutions. If it be not achieved, our theory of government is belied, our faith in majority rule as the beacon light of humanity is crushed, our confidence in the desire and willingness of a democracy to safeguard both property and personal rights is forsworn. This way, and this way only, safety lies. To conserve the nation thru intelligent radicalism. Why not? How else? Let it stand at that.

*Because he is constructive and effective.*

Ignorance may be destructive; passion often is; intelligence never. Today, in this country abounding in resources, energy and skill, industry pauses, business lags, development has practically ceased. Why? The answer is universal: Uncertainty, resulting in lack of confidence. In such a condition, what is the chief need? Clearly, unless we admit failure of popular government, a revival of the recognition of mutuality of interest.

"We have passed the time of excitement, of general complaint, of undiscriminating condemnation," says Wilson. "There has been hostility enough all around. What we need now is to take common counsel as to what is for common benefit, for the good of the country and of the several communities in which we live and earn our bread and also our happiness. We need frank, outspoken, friendly opinion. We need criticism which is not intended to damage, but to create a better understanding all around. To have any fear or favor in the matter is to be untrue to every standard of public duty. . . . We want to put business on a sound basis and with the assurance that when we have done it we have not destroyed anything, but have reconstructed. We want definite information as to what the law means and what it provides. We don't know now what the offense is and what the penalty is."

All Wilson asks of corporations is that they give the people honest service at a reasonable rate, not with the primary idea of squeezing and exploiting them, but with the primary idea of serving them. Nor can he perceive any advantage in dissolving corporations, however great, when so doing serves only to throw great undertakings out of gear, to the infinite loss of thousands of innocent persons, and to the great inconvenience of society as a whole. Regulation, not disintegration, is Wilson's remedy for existing evils, without regard to the "size or might" of the corporation, "if you will but abandon the fatuous, antiquated and unnecessary fiction which treats it as a legal person, as a responsible individual." He would be loth to sacrifice the "efficiency and economy" which tend to stimulate rather than destroy competition, and he would applaud and encourage the builders of properties, however great, while sternly condemning and repressing mere manipulators who deceive and swindle the public.

In working out these problems, moreover, "the Democratic party must be a party of law and of service within the law. If we cannot serve the country under the law, we must ask the people to change the law. We must not take it

upon ourselves to change it without their consent."

Upon utterances such as these Woodrow Wilson was elected Governor of New Jersey. To carry out his pledges he was obliged to win the support of a Republican Senate and to beat down the opposition of the bosses within his own party. He did both by appealing directly to the people, and placed upon the statute books a record of constructive and effective legislation unmatched in the history of any State. Destruction followed—destruction of the control of State government by a public service corporation; that and no other.

*Because he is free.*

Few have attained great political prominence without making alliances and incurring lasting obligations in the successive stages of advancement. Nor can many withstand the influence upon perspective of association. It is not, then, so much a matter of condemnation of others as of congratulation upon the mere incident that Wilson is free. Whether or not, in like situations with others, covering years of office-seeking, he would have become likewise entangled, is beside the mark. It is the *fact* that is important and peculiarly fortuitous at a time when, if ever, it is desirable that a President should have the whole people as his one and only master.

That such is indeed the case with Wilson hardly requires demonstration. It is evidenced conclusively by his every word and deed. To the leadership which effected his own nomination for Governor upon a platform guaranteeing specific reforms he stood ready to accord due recognition, but when the leadership came into conflict with faithful performance of public pledges he could not and did not hesitate to choose and to serve the one master to whom he had pledged his own allegiance. He did not attempt to weigh obligations, the one against the other; he did not temporize nor try to harmonize. The straight and narrow path pointed out to him in his youth was the only one he knew—and he took it, disdainful of personal criticism and heedless of personal consequences. That exceptional credit should be accorded him for so doing does not follow necessarily. The forces impelling his conduct were inherited conscience and developed character; agencies, however, as valuable in the public service as they happily have proved to be irresistible in the man.

It is as a highly important fact, too, rather than as a matter of personal merit, that Wilson's environment, associations and sphere of endeavor have tended to keep high his ideals, to broaden his vision, and to intensify his resolution. To have achieved great prominence and the rich emoluments which accompany success at the bar would have been a meritorious performance and worthy of all praise, but in no way commensurate with the advantages he derived from enforced industry, from enforced frugality, from enforced association and sympathy with those who, like himself, were compelled to earn their bread and rear their children with the product of brain and toil.

Such necessity and such environment makes for that freedom of understanding which is no less the requisite of a great magistracy than freedom from political obligation to any except to all. "The rich," says Wilson, "can always take care of themselves. Good government is the sole protection of the poor."

*Because he is a Democrat.*

That may sound trite or commonplace. Let us see. When the time came for the new republic to put into practice the admirable theories which its founders had put upon paper, the actual application devolved upon the governing class. No one—not even Jefferson—at the time of Washington's inauguration had dreamed of any other possibility. A mighty step forward had been taken. For the first time personal liberty, no less than protection of property, was guaranteed. Equal rights to all white males were also assured, etc., etc. But when it came to the actual management of public affairs the responsibilty must devolve, as a matter of course, upon those fitted by birth, education and training to bear the burdens safely and solve the problems with sagacity. It was to be a government *of* the people necessarily; else it would be no government at all. But it was to be more specifically the very best government *for* the people ever known, carried on in their interest and with their acquiescence by the very

best and most conscientious governors ever known. This was as far as the Fathers got under Washington and Adams and the other patriotic artistocrats who, during the first twelve years of the republic, sat in Cabinet, on the bench, and in the two houses of Congress.

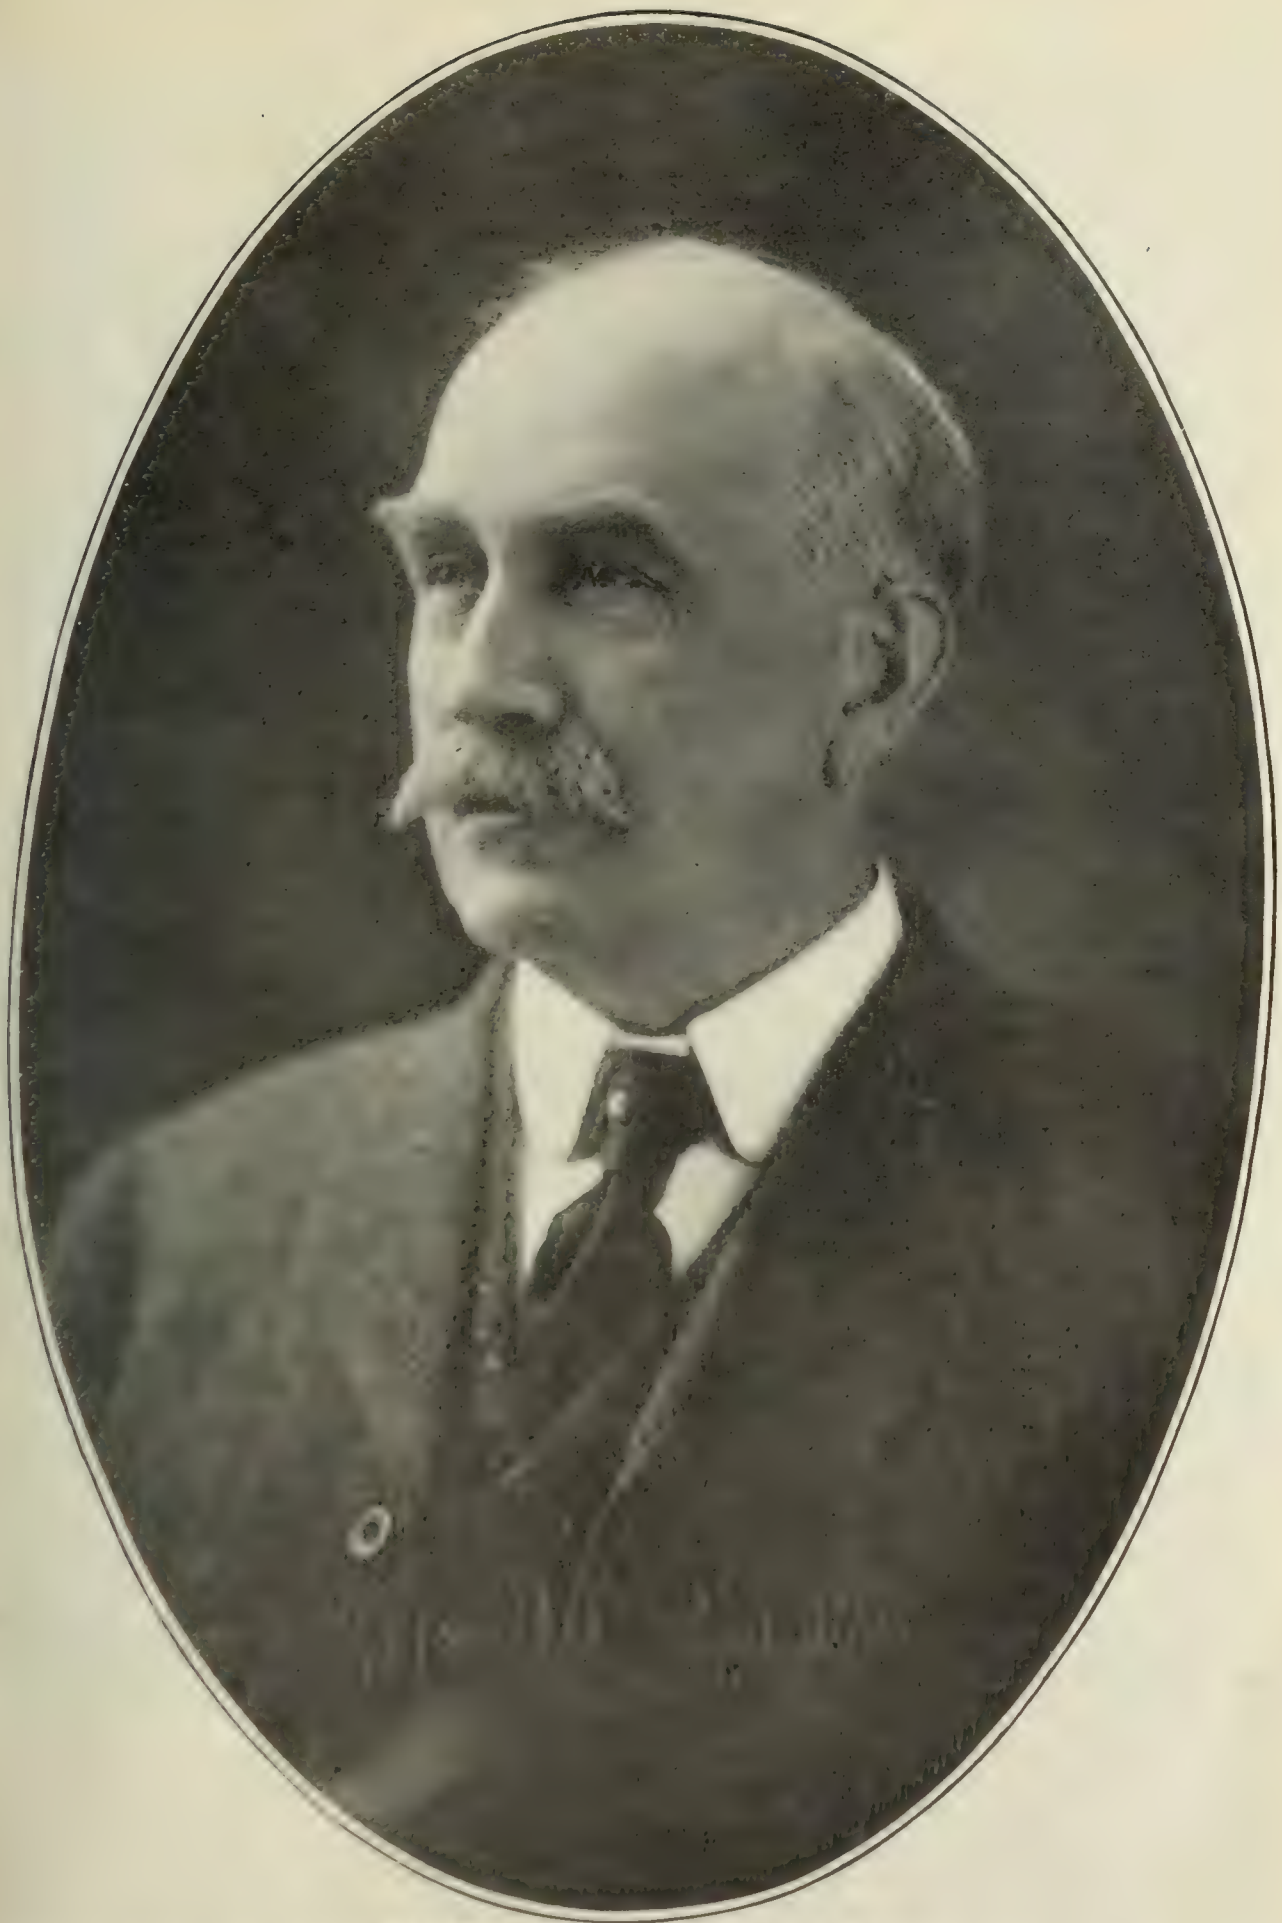
Government *by* as well as of and for the people was first proposed and put into practice by Thomas Jefferson, who thereupon became the first real Democrat. As a student and philosopher he beheld danger in heeding the customs of the past and restricting to a class, however capable, the possession of actual governing powers. He felt the need of broadening the base of government to insure the stability of the structure of democracy. To do so involved implicit faith in the wisdom and sense of justice in the entire body politic. But this he had, and acting upon his judgment, endeavored by precept and example to instil the theory of true democracy into the minds of the people. Denounced as a radical, even as a revolutionist, he grew stronger and more determined under opposition, until what had been only an impulse originally became a passionate conviction. Reaction followed as a matter of course. Habit of mind is not changed permanently with ease. But the spirit which inspired Jefferson could not be killed. It flashed forth incongruously for a time in Jackson, then waned thru long years, until it burst into flame in Lincoln, only to subside again in a period of great development and common prosperity, until there arose from apathy and indifference another governing class—the oligarchy of the Republican party, which has really ruled the nation as with a rod of iron, even thru two administrations which were nominally Democratic and one as spasmodic as Jackson's, to the present day, and is breaking down at last only under the added weight of heedless greed.

The time is ripe and the people are now ready for a fresh manifestation of the spirit of true democracy, which alone can safeguard personal and property rights by perpetuating the republic. It is to be found in Woodrow Wilson, the natural successor by birth, instinct, training, ability, courage and *faith in the people* of Thomas Jefferson.

*Because he would be elected.*

I have tried merely to set forth a few of the reasons why Mr. Wilson *ought* to be elected. That he *would* be—speaking, of course, from the present outlook—hardly requires demonstration. But this is one of the years where *the people must nominate as well as elect.* Will they do it? That is the question—the only one.

New York City.



## II—Governor Judson Harmon

BY HON. JAMES M. COX

Congressman from Ohio.

SOME one long ago made this observation with reference to conditions purely and exclusively American: "The HAZARD makes the man." We have accepted the axiom, partly because its truth has been demonstrated, but mainly because it is an implied compliment not only to our citizenship, but to our institutions of government. And yet when we face great emergencies caution is and should be an impulse richly mixt with the cheerful optimism just suggested. Since it is admitted that the future holds developments that will make the highest possible calls on the minds and hearts of men, then none will deny the wisdom of selecting "the MAN for the hazard." This thought applies with peculiar force to the affairs of the Democratic party today because political evolutions are being worked out along its course, and the responsibility naturally falls to it.

The task of the writer then is to demonstrate, or attempt to, at least, that the logic of this observation suggests the Presidential availability of Governor Judson Harmon of Ohio. The probability of party success appeals to many of the men who make up national polit-

GOVERNOR JUDSON HARMON OF OHIO

Governor Harmon as Bryan's strongest opponent in 1908 and has become stronger every year. His nomination as either President or Vice President on the Democratic ticket in 1912 is practically conceded.

national conventions, and the mere desire to win, altho not prompted by the loftiest patriotism, is not something to deplore, because there can be no chance for victory unless the candidate, in the mature judgment of the American electorate, is the man for the place. In the professional and commercial operations of the day, if a responsible position is to be filled, the mental force and the moral qualities of the man under consideration are presumed, and the rule universally followed is to measure well the exactions of the station and then ascertain the temperamental organization of the man—in short, his habits of thought. If this requirement seems to be met, then there must be abundant evidence that he has made good in his previous relations. If the best interests of the party and the country are to be conserved, this common practice, understood by every one, should be carried into the deliberations of the Democratic party in its making a Presidential nomination.

The Presidency of the United States is, as every one knows, an executive office. The President enforces the mandates of the lawmaking branch of the Government. But he does something more. He is, in a sense, the directing head of the lawmaking branch of the Government, since the Constitution directs that he shall from time to time inform Congress as to the state of the Union and make such recommendations for the enactment of laws as he sees fit. With the consent of the Senate, he must fill thousands of appointive offices, including judges of the courts. Under the laws as they exist, he must administer the affairs of the Government, and this often entails the issuing of proclamations and edicts which in themselves amount to the enactment of laws or rules of conduct or methods of procedure. As executive head of the Government, his utterances are taken by foreign countries as an index to the will of the people of this country. He is, therefore, a tremendous factor for peace or war, even tho he cannot declare war. However, he is commander-in-chief of the army and navy. He appoints his own Cabinet officers or assistants, and is therefore responsible for the conduct of every department. These departments deal with the prosecution of persons violating the laws of the land, with the conduct of the postal service, with the handling of the public domain under the laws made by Congress, with inspections, examinations and investigations of a hundred kinds. The collection of revenue, the disbursement of public moneys under acts of Congress—a thousand and one duties must be attended to by the assistants of the President, every one of whom he appoints and for whose efficiency he is responsible.

In short, an ideal President should be a man of splendid poise, of a judicial turn of mind, of great common sense, of perfect discretion, of calm and methodical thinking, of tremendous energy and of unquestioned honesty of purpose. He should be fearless, of course; capable of doing what he conceives to be for the best interests of the people as a whole, regardless of the carpings of the critics. He should be endowed with kindness, but of sufficient sternness to be governed by cool and calculating logic rather than by sentiment. His habits of thought should develop from a desire to see the masses prosper. That is, he should be broad enough to know that a nation is great only in proportion to the greatness of the average citizen thereof; that a country is not judged by its extraordinary citizens, but by the ordinary masses.

While the President must to some extent represent the nation socially, especially in his intercourse with the diplomatic corps, he should have ambitions above the silly tawdry of the ballroom. It is a serious office, that of President, and its duties should be taken seriously and its burdens borne with dignity.

Now, with such measurements of the office of President, correct in outline if not in detail, let us see if Governor Harmon measures up to the standard. In other words, let us take his measure and compare it with the size and importance of the office.

Governor Harmon is about sixty years of age. By nature he is broad and generous, kindly disposed at all times, energetic and resourceful and tireless. Six feet tall and square-shouldered, with a steady eye and a shapely head, Judson Harmon "looks the part." He has been for years and is yet an athlete, his pleas-

ure in red-blooded activities such as swimming, rowing, sailing, horseback riding and golf supplying the explanation for the remarkable force, vigor and industry that he brings to his work as a servant of the people. He is calm and judicial at all times and cannot be stampeded. He is courageous; the mob does not frighten him nor "special interests" disturb his poise.

He combines a knowledge of the law with great common sense and is a business man in every thought and action. A man of family and a home lover, quiet in his tastes and manner, economical in his habits and studious at all times, he is as lovable a character as is in public life today.

He is a splendid judge of men, correctly estimating their motives and their efficiency. He insists upon system and method in all departments over which he presides, and is the first Governor of his State who has insisted upon an inventory of all State property of whatsoever kind. Until he became Governor the people of Ohio knew nothing whatever about their own property. Governor Harmon has secured a law and appointed a commission to make a thoro inventory of the State's effects, that the people may know something about their investment. The fact is mentioned simply to show the methodical nature of the man and his insistence upon system. So much for the personal side of the man.

His training and his service as an officer of the people form a valuable guide as to what might be reasonably expected of him in a higher sphere of action. He was born in an Ohio town and attended its public schools. He graduated from one of the smaller colleges in the State, a sort of a cornfield institution, where the acquiring of an education was considered a serious matter. He finished his course at college the year following the civil war and was old enough to understand the intensity of the issues which precipitated that struggle. He graduated from the Cincinnati Law School and immediately began the practice of law in that city. Six years later he was elected a common pleas judge, and was later elected Judge of the Superior Court of Cincinnati. From this position he resigned to engage in the private practice of his profession.

President Cleveland appointed Mr. Harmon Attorney-General of the United States in 1895. The appointment came as a surprise, but Mr. Cleveland informed Harmon's friends that the appointment was only made after the maturest deliberation, and with never an outside influence of any kind having been brought to bear upon him. He attracted public notice at once as Attorney-General by picking up the loose ends in the great Trans-Missouri case. Even tho it had been lost to the Government in the lower courts he prest it to trial in the Supreme Court of the United States and won a signal triumph. That decision, made possible by his persistence and able advocacy, established the application of the Sherman anti-trust law to the operations of railroads, and vitalized an important principle into the jurisprudence of the land. He retired from the Cabinet with the expiration of Mr. Cleveland's term, and soon thereafter was employed as special counsel with Frederick H. Judson, of St. Louis, by President Roosevelt, to investigate the charges of rebating by railroad officials. With characteristic energy and fidelity to trust Judge Harmon soon located the guilt. The offender was then in President Roosevelt's Cabinet, having resigned his railroad connection to enter public life. The President, moved doubtless by considerations of personal friendship, did not endorse the recommendation of Judge Harmon that the guilty persons rather than the corporation should be punished. Instead, the President urged that action be taken against the company. Judge Harmon protested that "guilt was personal," and public opinion has brought general acquiescence in this view, even by the highest courts of the land. When the Government refused to take steps against the individual, Judge Harmon resigned rather than be a party to travesty against justice.

After returning again to private life and to the practice of the law, Mr. Harmon was chosen president of the Ohio Bar Association. In the course of his practice he was made receiver of a railroad corporation whose affairs were in

bad shape. The road had been juggled and loaded and was wrecked and thrown into the courts. There was discontent all along the line. The employees were dissatisfied, the stockholders had been defrauded, the bonds had been defaulted, and the rolling stock of the road had disintegrated. It was the traditional "streak of rust" that the receiver took hold of, instead of a railroad.

Out of this chaos Harmon brought order. He increased the wages of the employees and granted them shorter hours. He settled lawsuits and paid debts. He secured creditors and paid bonds. He ran the road in a business-like way and built a valuable piece of property out of the rust and ruin, and turned it over to its rightful owners, a good investment. One incident of his receivership will give a pretty fair idea of Governor Harmon's humanity—of his great good heart and his kindly emotions. While he was receiver, there was a terrible wreck on the road in Michigan. Scores of people were killed and a large number injured. While the dead and dying were still strewn about the wreck an attorney of the road went to the scene to "protect the interests of the road," as he put it. Harmon heard of it and ordered him back to his office. There were to be no lawsuits on account of the wreck, he said. The road would not take advantage of any technicalities. There would be no delays. He had money advanced to the injured to help them along. He told those interested that they need not bring suits; that the cases would be settled equitably and generously. He did not inquire into the details of the wreck to escape responsibility. He had every case settled promptly and to the satisfaction of the claimant, and without a cent of cost to any claimant. To this day the name of Judson Harmon is revered in Michigan. He would not lose a vote along the line of the road where the accident occurred.

Three years ago Governor Harmon was a candidate for the Democratic nomination for Governor of Ohio. After a bitter struggle in which much party animosity was bred, he was nominated. He made the race upon his personal merits, and told the people frankly that if elected he would run the State upon the kind of business principles he had been following. At the ensuing election, November, 1908, he was elected by a plurality of about 20,000 votes. Taft carried the State at the same time by more than 69,000.

Governor Harmon entered upon his duties as Governor in January, 1909. His inaugural address had the ring of statesmanship and the people knew at once that a master hand had taken charge of their affairs. His words deeply impress the intelligence of the State:

"Then, too, the civic conscience has grown more sensitive and alert. It has come to be generally realized that betrayal of public confidence is the worst of all offenses in the broad sweep of harmful results. If not handled with prompt vigor it quickly spreads its poison and, by weakening respect for authority, encourages all whom that alone restrains from wrong. Private offenders seldom go free, because there is always a victim who urges pursuit. The victim of public wrongs are the entire people. They are too numerous to aid justice in person. They entrust this to their officers, and to these, if worthy of the confidence placed in them, the offense is magnified by the multitude of the wronged instead of being reduced by division among them after the manner of the unthinking or low thinking."

No loftier note of devotion to trust was ever uttered in Ohio, and wrongdoers soon felt the influence of government, as administered under this conception of duty and with a splendid courage. Public officials who had debauched their calling were sent to prison, others who had collected money as interest on public funds were compelled to return it, and the State institutions were put in order. Governor Harmon was the only Democrat elected in 1908, the Legislature being solidly Republican, so that nothing of note was accomplished in legislation. In characteristic fashion the Governor became thoroly familiar with every detail of State government and noted conditions that could be corrected both by a change in laws and administration. In the campaign of 1910 he spoke in every community and frankly told the people what he had found out and what he purposed doing if he were given the assistance. By a plurality of over 100,000 his administration was endorsed and the whole Democratic State ticket elected, as well as a Democratic

Legislature. The situation this created gave full rein to the abilities of the man. Whether Governor Harmon ever becomes President or not, posterity will give him high rank for his progressive and constructive work as State executive. Laws created and reforms accomplished during the last legislative term have made a new and wholesome order of things in a State badly in need of radical changes. Platform pledges were kept. They were made, as the Governor believed, as a sacred covenant, and were carried out in good faith. The important reforms effected were as follows:

The establishment of competitive bidding by banks for the use of public money.

The creation of a central board to control State institutions, displace numberless boards of trustees and bring applied business principles and economies into the operations of public concerns.

A complete change in the system of taxation which insures the nearest possible approach to the listing of personal property and real estate for taxation on a basis of value—also a tax on public utilities, measured by their value in money.

The wholesome control of public utilities with the rights of every community safeguarded against excessive practices.

The ratification of the income tax amendment to the Federal Constitution.

The adoption of the Oregon plan in the election of United States Senators.

Extension of the privilege of initiative and referendum, to municipalities, the petition percentage being 15 per cent. for the referendum and 30 per cent. for the initiative.

The inclusion of the study of agriculture in the course of village and district schools.

The nonpartisan election of the judiciary.

A shorter work day for women.

An employers' liability law for the relief of injured workmen and the families of employees killed while on duty.

A corrupt practices act to purify elections.

The calling of a constitutional convention to make further progress possible.

Apparently the whole scope of governmental ills and insufficiencies was scanned by a man with the vision of a statesman who had also the practical constructive capacity to do things. Governor Harmon has demonstrated a grasp of the broad humanity of the hour and a common sense method of performance that will always stimulate and not hinder real progressive government.

WASHINGTON, D. C.

## III—Speaker Champ Clark

BY COL. JOHN TEMPLE GRAVES

EDITOR OF THE "NEW YORK AMERICAN."

IT is perfectly certain that the Democratic battle of 1912 must be fought upon the record and achievements of the Sixty-second Congress.

The landslide which elected six Governors and forty-seven Congressmen in 1910 was not an expression of confidence in the Democratic party. It was essentially an expression of disapproval and distrust of the Republican party. As a result, the Democratic party came into power distinctly on trial—to be measured by its achievements, to be reckoned upon its worth, to be rewarded for its fidelity, or to be condemned for its failure to meet the popular will.

The record of the House majority in the Sixty-second Congress is without a superior in our modern legislative annals for unity, coherence, definiteness and practical achievement. The Democratic party has never had such an effective fighting machine. As a result of the extra session, called by the President to pass the Reciprocity bill, the Democratic majority passed swiftly and smoothly, and yet with perfect fairness and deliberation, every single bill that its platform pledges promised to the American people. As a fighting platform for the campaign of 1912 it is flawless and complete. No party ever went with a better record to ask the ballots of the American people.

And this coherent and effective Democratic majority is as much or more the product of Champ Clark than of any other single individual. It is quite true that Oscar Underwood, as chairman of the Ways and Means Committee, has conducted the cause of the majority on the floor with consummate balance and skill. He has won and deserves golden opinions for his courage, his calmness, his discretion and his ability.

But it is also true that the Democratic majority, for four preceding years, when it was a minority, has been conducted with equal skill and effectiveness by Champ Clark. Since John Sharp Williams withdrew from the Democratic leadership, Champ Clark has led the parliamentary fortunes of the party. He led it, too, in the darkest and most despairing days of Democratic history. He has been fearless, aggressive, undaunted and clear. He has fought the Republican leaders upon the floor of the House, upon the hustings, and upon the American platform—the ablest and best of them—and has sustained the principles and the prestige of the party in every field of intellectual contention.

Moreover, it was under the leadership of Champ Clark that the despotic Cannon regime was destroyed in the House of Representatives, and that the rules were reorganized. It was his own signal judgment of men that elevated Oscar Underwood to the chairmanship of the Ways and Means Committee. Not a measure has been considered or decided upon in the all-powerful caucus of the Democratic party without the concurrence and co-operation of the Speaker of the House.

Not a legislative sparrow has fallen to the Democratic soil without the knowledge and co-operation of Champ Clark.

Neither Oscar Underwood, nor any other Democrat, can or will attempt to deprive Champ Clark of the just laurels of the titular and actual leadership of the greatest and most effective fighting machine that the Democratic party has ever known!

If the Democratic party, by its achievements, shall deserve the suffrages of the American people in the election of 1912, then Champ Clark, logically, by his perfect record, richly deserves to lead that party to victory at the polls.

In another way the Speaker of the House of Representatives has a peculiar claim upon the appreciation and suffrages of that great body of the people whose political faith is exprest in the Democratic party. In the recent strong and powerful arraignment which Mr. Clark has made of the Republican President for his veto of the Democratic tariff measures, he has gathered to himself the aggressive leadership of that fundamental principle of representative government intact against executive usurpation.

President Taft went into office under a distinct pledge of tariff revision downward. The people voted him into office upon the strength of that pledge, and his election was an expression of the public will for reduced taxation and consequently the reduced cost of living.

The Republican party, under the Republican President, failed to fulfill its pledges to the American people, and instead of the bread of a genuine tariff revision downward they offered to the people the stone of the Payne-Aldrich tariff bill.

Then came the election of 1910, in which the people exprest their resentment of the unfulfilled Republican pledge of tariff revision, and once more voiced their wishes upon this vital economic measure by the landslide which overthrew Roosevelt and the Republican party, and gave the House of Representatives to the Democracy.

So that there have been two mandates from the people upon this vital question. First, in the election of President Taft. Second, in the Democratic landslide—both definite and explicit in the demand for tariff reform. Therefore, when President Taft, against an overwhelming majority of the Democratic House of Representatives, and against a pronounced majority of the Republican and Democratic Senate, strangled with his veto the public will, which called for tariff revision downward, he used his veto not more for the discomfiture of the opposition party than for the denial of the people's will and the usurpation of their right to rule.

Attacking this veto in three strong and powerful speeches, Champ Clark has held up the theory of real representative government, and in a militant Democracy becomes the central figure standing for that great question.

It may be said simply and without further emphasis that no man has ever asked for the Presidency in this generation upon two stronger and more logical claims than the Speaker of the House.

Of the three prominent candidates for the Democratic nomination Champ Clark

SPEAKER CHAMP CLARK

Champ Clark is an unique character in American politics, and has won many friends by his genial disposition and [illegible] Mr. Roosevelt has said that Champ Clark would make the strongest candidate for the Democratic party

has a conspicuous advantage in another fact. The followers of Judson Harmon are constantly under the necessity of defending him against the charge of ultra-conservatism and the suggestions growing out of his past intimate associations as an attorney for great corporations.

The friends and advocates of Woodrow Wilson are also constantly upon the defensive, because of the suddenness of his conversion from the ultra-conservative to the ultra-radical view, and because of certain surrounding associations whose attitude toward popular interests is seriously in doubt.

If either Mr. Harmon or Mr. Wilson should be nominated, he will be constantly compelled to defend himself and to explain himself, both before and after his nomination for the illustrious office.

The friends of Champ Clark, on the other hand, have nothing to explain and nothing for which to apologize. There is absolutely not a flaw in the public career of the Democratic Speaker of the House and not an objection that can be urged against him, either upon the hustings or in personal conversation. He has a flawless record of twenty-five years of faithful, capable and fearless service for the Democratic party.

He has gone thru every office of development to fit him for this lofty station. Thru the kindergarten of Pike County politics; thru the primary school of the Missouri Legislature; thru the high school of the American Congress; up to his present lofty station as the second officer of the Government, every step of his career has fitted Speaker Clark for service in the Chief Executive's office.

To pass, after his long experience, from the Speakership of the House of Representatives to the Executive office of the White House would be to Champ Clark simply like passing from one room to another.

And in all this career there has been no act and no expression which would give his enemies a hammer to batter his record or his capacity. He is a Progressive Democrat, and the leader of the Progressive Democrats in a progressively democratic age. In his inaugural as Speaker, he assumed, far in advance of the recent speeches of President Taft, the high and sensible position that the Democratic party had as much interest in prosperity in this country as any other party, and that it had too much interest, both in prosperity and in property, to endanger either by unwise and foolish policies in government.

A discreet radical and a progressive conservative, with nothing in his record for which to apologize and explain, I submit that Champ Clark offers the best possible compromise between the contentions of the conflicting factions which champion the causes of Governor Wilson and of Governor Harmon.

There is another remarkable qualification which fits Champ Clark peculiarly for the Presidency. His long career in Congress, and his intimate knowledge of the ways of Congress and of the motives that move the two houses is an equipment for the Presidency which the history of that office will emphasize.

Grover Cleveland was one of the greatest statesmen that America has produced. Of his ability and integrity there can be no doubt. And yet Grover Cleveland's two terms were incessant wrangling conflicts with the House of Representatives, and he left the White House with his party broken and disorganized—simply because he did not know how to handle the American Congress.

William McKinley had, perhaps, the most popular administration of the Presidency that the country has known. With less individuality than Cleveland, and perhaps with less ability, his administration was full of achievement and comparatively free of friction, because his four terms in the American Congress had taught him how to deal with that body and how to secure legislation at its hands.

Theodore Roosevelt, with his strenuous and impulsive career, had seven years of strife and wrangle with the American Congress, which he did not understand because he had never been a member.

Benjamin Harrison, who had, perhaps, the smoothest administration of the quarter century, had served three terms in the Congress of the United States.

It is safe to say that if Champ Clark were elected President, he would know better than any man who has ever occupied that lofty station how to handle Congress in the most effective way, and how to secure from the legislative body the fullest possible co-operation with the policies of the Chief Executive. This makes a measureless advantage to a Democratic administration.

In a Presidential campaign no man can overestimate the effect which a candidate's personality has upon the mass of the American voters. One of the most remarkable qualities in Champ Clark, and one of universal recognition, is the fact that with all his strength and force *he does not excite friction*, either among his friends or his foes. The best rough-and-tumble debater in the House of Representatives, he has enjoyed on the floor universal popularity among both parties; and, in the Speaker's chair, stalwart in partisanship and in conviction, he has received from the Republican minority leader and from individual Republicans, as well as the absolutely solid devotion of his own side, the most conspicuous tributes that have ever been given to a Speaker of the House.

It is a notable fact that, with a full consciousness of his absolutely stalwart Democracy, the leading Republicans, as well as the rank and file of the Democratic party, and of the Republican party, would rather see Champ Clark elevated to the Presidency than any other man.

As a campaign speaker for the hustings Mr. Clark is better than Harmon, better even than Wilson, and fully as effective as Bryan. His magnificent stature; his splendid and rugged personality; his utter fearlessness, and his rugged force, joined to a compelling eloquence, make him one of the most effective campaigners that ever asked the highest office in the gift of the people.

Roosevelt came back from the West saying that Champ Clark would make the strongest possible candidate for the Democratic party in 1912.

Ambassador Sherrill (to Argentina), ablest and keenest of Republican diplomats, after speaking to two hundred and twenty American Boards of Trade, declared that Champ Clark would be the hardest man in America for the Republican party to defeat.

James R. Mann, leader of the Republican minority in the House, declared that Champ Clark "had more courage and directness than all the rest of the party combined, and was worthy of any office in a Republican form of government."

And the Democratic majority—that wonderful House machine—has given to Champ Clark such frequent and overwhelming evidence of boundless confidence and boundless affection as to indicate the reception which he would have from the people if the Democratic party should present him as their standard bearer in the campaign of 1912.

I respectfully submit that these considerations—this record of vital leadership in the House of Representatives; this evangel of representative government against executive usurpation; this flawless consistency of record, which does not call for apology or defense; this superb equipment for executive usefulness by long service in Congress and in all the preceding ranks; this capacity to fight for great causes without exciting personal friction—all these things, I submit, make up the complete and convincing argument that Champ Clark is the best and safest man upon whom a hopeful Democracy can reconcile its factions, compromise its differences, and march forward to a Presidential victory.

The Democratic party fronts the greatest opportunity it has known in twenty years for entering upon a long lease of power.

Who is better entitled to lead the Democratic party than Champ Clark—the man who made that opportunity?

New York City

# The Attitude of Turkey Toward Italy

BY HERBERT ADAMS GIBBONS

[The writer in the opening sentence refers to his article, entitled "Turkey's New Method of Conquest" that appeared in THE INDEPENDENT of August 10, 1911. The present presentation of the Turkish attitude by a resident of Constantinople is both valuable and interesting.—EDITOR.]

TWO months ago I wrote for THE INDEPENDENT an account of the new Turkish method of conquest, the peace-making journey which the Sultan made thru Albania in the hope of winning back to allegiance his rebellious subjects. Where armies had failed for years to pacify by bullets, the descendant of Mahomet the Conqueror endeavored to pacify by words and deeds of kindness. In a large measure his efforts were crowned with success, and a new chapter was written in the sad and blood-stained history of Turkish rule in Macedonia.

Since then Turkey has come face to face with a situation which has tried to the last limit of endurance her desire to live peaceably with her more powerful and more civilized companions in the family of Europe.

On Thursday, September 28, the Italian Chargé d'Affaires at Constantinople handed to the Turkish Government an ultimatum, declaring Italy's intention to proceed to a military occupation of Tripoli and Cyrenaica, and requesting from the Sublime Porte *within twenty-four hours* the assurance that this occupation would meet with no resistance. Turkey responded that she was willing to accord to Italy economic concessions in Tripoli, but that it was impossible to consent unqualifiedly to the terms of Italy's note. Without delay Italy declared war, withdrew her representatives from Constantinople, gave the Turkish embassy staff at Rome their passports, and sank two Turkish torpedo boats in the Adriatic. Then she proceeded to blockade the coast of the Tripolitaine, to bombard Tripoli and Benghazi, and to send an army from Syracuse to seize Turkey's last possessions in Africa.

It is not my purpose to go into the causes of Italy's action, either to condemn or commend. The question of the Tripolitaine is a serious one which has been on the tapis of European politics for thirty years. It had been agreed in principle at Berlin in 1878 that this portion of Africa should revert to Italy "when the Ottoman Empire was divided." France in Tunis and England in Egypt made bold strokes many years ago, winning slices of the Mediterranean littoral on either side of Tripoli. In 1908 Austria annexed Bosnia and Herzegovina, destroying the Servian dreams which would have helped Italy by establishing an equilibrium in the Adriatic. Recently England and France have been striving for the Soudan. Their Nigerian and Algerian railways and military posts have stretched out into the *hinterland* of Tripoli. The Cape-Cairo railway is marching northward. When France sent an army to Fez and Germany a warship to Agadir I suppose Italy felt that she could afford to wait no longer. Besides, it was an opportune moment. Could the pots call the kettle black?

But Turkey has quite naturally had no sympathy with the colonial aspirations or political necessities of Italy, knowing that they were to be satisfied at her expense. It is true that she has for years harassed and opposed the expansion of Italian commercial enterprises in Tripoli in all those petty and exasperating ways which the Turkish official alone knows how to employ. But would you be friendly to the man who you knew was planning to rob you? And would you receive him with open arms?

It is evident that Turkey did not expect war. Within three months she has sent from Tripoli to the Yemen 8,000 soldiers. And with true Turkish negligence Tripoli has been left without army or ammunition or grain. The coast

fortifications have never been worthy of the name. Turkey relied, as she has consistently done since the days of Mahmoud and Abdul Medjid, upon the mutual jealousies of Europe to protect her. The very day that war was declared a prominent official said to me, "This declaration of war is a bluff. Europe will never allow Italy to attack us." While we were talking came the news of the first naval conflict in the Adriatic. "Good!" said my friend. "Now we shall see Austria show her hand before evening."

But Austria did not show her hand. None of the Powers intervened. For the first time since 1877 Turkey found herself alone and at the mercy of a foreign foe.

There are people who show in misfortune and adversity qualities of dignity and self-restraint which are sometimes lacking in days of prosperity and security. So it is with the Turks. Their attitude in the face of unwarranted aggression has been altogether admirable. It is a pleasure to note the advance of civilization in Turkey. One does not forget the Stamboul mob murdering the Patriarch in the Greek War of Independence, and the fate of the foreign consuls at Salonica. There used to be uneasiness and alarm—even flight from Constantinople—every time a crisis arose between Turkey and the Powers. But those days of fanaticism seem to have passed. Constantinople is peaceful; the provinces are quiet. The Italians even have not been molested. The political leaders and the preachers in the mosques urge upon the people the necessity of preserving the national honor by abstaining from excesses. The other day I observed the crowds before the bulletin boards of the newspapers quietly reading the reports of the bombardment and capture of Tripoli and of the sinking of Ottoman ships. I wonder if a London or Paris crowd would have been so orderly.

I have followed closely the events of the past two weeks, and it has been my privilege to come into daily personal touch during this trying period with the men who have to face the present situation and solve its problems. From the very beginning their inclination has been for peace. In spite of the insult to their patriotism and their pride they have sought patiently for the mediation of the Powers. Refused once, they have asked again, and yet a third time, leaving no stone unturned. These negotiations

THE CAPTURE OF TRIPOLI

The new Governor thanking the Italian Sailors for their services before sending them back to their ships.

MOUNTAIN BATTERY GOING INTO ACTION ON THE SAND HILLS NEAR TRIPOLI

There was an engagement between the Italian and Turkish forces outside Tripoli, October 23. The advancing Turkish cavalry were seen by Italian aeroplane scouts and the field artillery opened fire on the Turks, raking the sand hills with rifles and field guns and forcing the Turks to retreat. This photograph was taken for Underwood & Underwood, New York, during the recent manoeuvers near Tripoli. The position of the force parallels that taken in the still more recent battle.

have been carried on with a courageous determination, in spite of a strong war party which may later ask for a reckoning and charge with cowardice and supineness those who are now showing a high moral courage.

Here at Constantinople we call this a war that is no war. The Turks are not fighting yet. The Italians apologize for fighting. The diplomats all declare that there must be no war. We do not know what is going to happen. Perhaps in a few weeks we shall be calling the Turko-Italian war of 1911 a fiasco, a war that began and ended without fighting, and which was declared merely that Italy might legalize, and be facilitated in, her act of highway robbery.

If it does turn out in this way, let it not be believed that the peaceful issue of the affair was wholly due to Turkey's financial and naval weakness and her inability to fight. Although Turkey may not hope to save Tripoli, she is not entirely at the mercy of her enemy, with no means of striking back. Do not despise the power of the Islamic world, which would rise if the word were given. Remember that Turkey could endanger the peace of Europe and force an intervention; that she could shake to its very foundation the systems of alliances between the Powers, by rousing the Balkans. There are guns which Turkey might fire which would find their mark. There are some of great influence here who are striving to-day to have these guns fired. A powerful leader in the Chamber of Deputies said to me: "We may be blind and helpless like Samson before the mocking Philistines, but there is yet strength to break the pillars that hold up the edifice."

If Europe is saved from the reopening of the question of the Orient, if the Eastern Mediterranean is saved from a struggle which would entail great suffering and seriously affect the nations of Europe, politically as well as commercially, it will be because there are men in Constanople who know that war in the twentieth century is an anachronism, disastrous to the one who fights, however righteous his cause, however great his provocation, and that "he who takes the sword must perish by the sword."

Robert College, Constantinople, Turkey.

# Woman Suffrage in Six States

BY IDA HUSTED HARPER

Author of "Life and Work of Susan B. Anthony," "History of Woman Suffrage," Etc.

WHEN on November 8, 1910, the State of Washington, by a very large majority vote of its electors, gave the complete franchise to women citizens the subject of woman suffrage passed from the stage of academic discussion to that of a live, practical question; and when on October 10, 1911, California fully enfranchised the women of that State it became one of the political issues of the day. This fact was evident at once in the attitude of the press, which in its news reports gave woman suffrage equal if not superior place to the referendum, recall and other important constitutional amendments which were passed upon at this recent California election. It was equally noticeable in the editorials, especially of papers heretofore opposed, such, for instance, as the New York *Tribune*, which said: "Now that Washington with 1,142,000 population, and California with 2,377,000, have shown their desire to put the political equality idea into practice, the pressure behind it will become more acute and the larger and older States will have to take more serious notice of its existence."

The experiment heretofore in the United States has been made in the four comparatively new and sparsely settled States of Wyoming, Colorado, Utah and Idaho, where women are greatly outnumbered by men and no large cities exist with their complicated political and social problems. While it is true that human nature is the same everywhere, yet it must be admitted that in these four States there has not been an opportunity for such a real test of woman suffrage as would be necessary to influence the older and more thickly populated ones. Denver, with a little less than 214,000 inhabitants, has afforded the most conspicuous example for study.

Now that the question of woman suffrage is to receive more attention it may be of interest to examine its history in the United States up to date. The very first demand for it was made by women of Eastern States, which will be the last to grant it—Elizabeth Cady Stanton and Susan B. Anthony, of New York; Lucretia Mott, of Philadelphia; Lucy Stone, of Boston, and a score or two more of the most distinguished women of sixty years ago. The first recognition of the principle by any State was made by progressive Kansas, which came into the Union in 1861 with school suffrage for women in its Constitution. No further advance was made until 1869, when the first Legislative Council was in session after the organization of Wyoming as a Territory. Mrs. Esther Morris, who with her husband had gone out from New York as a pioneer, appealed to the president of the council Col. William H. Bright, for a bill enfranchising women. She was sustained by his wife, and he succeeded in having the bill passed. The council was Democratic and it hoped to embarrass the Republican Governor, John A. Campbell, whom it expected to veto the bill. On the contrary, he signed it; and when two years later the council repealed it he vetoed the repeal. The council was unable to pass it over his veto and no effort to abolish woman suffrage was ever again made in Wyoming. Mrs. Morris was appointed Justice of the Peace, and of the nearly forty cases she tried none ever was appealed to a higher court. Women sat on juries from the beginning and have continued to fill various offices down to the present day.

In 1889 a convention composed entirely of men met to form a Constitution for Statehood, and after twenty years' experience they adopted unanimously as its first clause "equal political rights for all male and female citizens." The Constitution was ratified by more than a three-fourths majority of the peo-

ple and sent to Congress for approval. That body, always hostile to the enfranchisement of women, fought for three days to have this first clause eliminated and the Territorial Delegate telegraphed to Wyoming that it looked as if this would have to be done. The Legislature, which was in session, wired back, "We will remain out of the Union a hundred years rather than come in without woman suffrage." The same struggle took place in the United States Senate and pages of the Congressional Record were filled with awful Senatorial prophecies as to what would happen to the country if Wyoming should come into the Union with women voters. After days of oratory they were obliged to face the calamity, and President Harrison signed the bill admitting the new State in June, 1890. Thus Wyoming became the first commonwealth in the world's history to grant to women the same rights in the government that men possessed. The official statistics show that about 90 per cent. of the women qualified cast their votes at the annual elections. Not one man of prominence has ever voiced publicly the slightest opposition, while volumes of favorable testimony from those eminent in all departments of the State's activities have been published. Again and again the Legislature has adopted resolutions expressing the highest approval of woman suffrage, urging other States to adopt it and calling upon Congress to submit an amendment of the National Constitution to the various Legislatures.

We come now to the second State which has fully enfranchised women—Colorado. When it made its Constitution for statehood in 1876 it refused the entreaties of the women to provide in this for their enfranchisement, but it gave them school suffrage. The curious provision was made that the Legislature of the new State might at any time by a majority, instead of the two-thirds required for amendments, enact a law to extend the suffrage without amending the Constitution, but the law must be approved by the majority of the voters; and it was ordered that such a law should be submitted at the first election after the State came into the Union. This was done in 1877 and the men, glorying in their own newly-acquired rights, defeated the measure by a vote of two to one. The women were discouraged and the matter rested till the early '90's, when there were many more of them, and they began to organize their forces. In 1893 the Legislature was in entire control of the Populists and a woman suffrage bill was again sent to the voters. Men, too, had progressed during these years and at the November election it received a majority in favor of 6,347.

The women entered at once upon their new duties and the official records show that during all the past eighteen years they have voted in quite as large a proportion as men. They have evinced no especial desire for office, but more than a dozen have been elected to the Legislature and scores to the various county offices. The office of State Superintendent of Public Instruction has always been filled by a woman. They serve on State boards and commissions and are eligible to jury service. The testimony in favor of the way they have used their ballot is overwhelming and from the highest sources—justices of the Supreme Court, Governors, presidents of colleges, clergymen, editors. Not one Colorado man or woman of prominence has ever given public expression to a derogatory word. The strongest proof of the success of woman suffrage in this State, however, came ten years after it had been in operation. The suffrage clause in the Constitution permitted immigrants to vote on their first papers and six months' residence. An amendment was submitted in 1903 requiring a year's residence and using the words "he or she." It was adopted by 18,000 majority and it safely intrenched woman suffrage in the Constitution of the State. With the Populist party eliminated the vote for it was three times as large as before it had been tried. If this increase was due to the women it showed they appreciated their voting power and wished to make it secure; if it was due to men it proved they were satisfied. In either case the result was decisive.

In 1895, two years after the Colorado victory, a convention of Utah men assembled to make a Constitution for statehood. The Legislature in 1870 had given full suffrage to women—as it had power to

do in a Territory—and they had used it largely until 1887. That year Congress, thru some inscrutable logic, took away the franchise from all the women, Gentile as well as Mormon, to stop the practice of polygamy! This convention was composed of both Gentiles and Mormons, and after a thoro discussion a strong woman suffrage plank was put into the new Constitution. At the November election it was submitted to Gentile and Mormon voters and carried by 28,618 ayes, 2,687 noes. This was the answer of Utah men after an experience with woman suffrage of seventeen years. This Constitution received no objection by Congress. The women of this State were far better organized and worked much harder for their political freedom than those of any other up to that time. They have used their franchise generally and wisely; no complaints or criticisms have ever come from Utah to the contrary. Women have been sent to both houses of the Legislature, have filled State, county and city offices, served on many boards and gone as delegates to Presidential conventions.

The story of Idaho is short and there is no great struggle for the ballot to record. It was admitted into the Union in 1890. Before and after that year Mrs. Abigail Scott Duniway, the pioneer suffragist of Oregon, had canvassed Territory and State and appealed to the Legislature and constitutional convention. She was strongly supported by individual men and women of Idaho, but there was no organized effort until 1893. The Republicans were in full control of the Legislature in 1895 and the resolution to submit an amendment was almost unanimous. The next year Republican, Democratic, Populist and Free Silver party conventions endorsed it and it was carried at the November election by a vote of almost two to one. At the next election three women were sent to the Legislature; one State Superintendent of Instruction, fifteen county superintendents, four county treasurers elected. This proportion has been kept up and there have been a number of deputy sheriffs elected. There is nothing but the highest testimony as to the part of women in the politics of the State. They constitute 42 per cent. of the population and by the official statistics they cast 40 per cent. of the vote in Boise, the capital, and over 35 per cent. in the rest of the State. The hardships of getting to the polls thru the snow and over the mountains can hardly be described. Women sometimes ride twenty miles on horseback to vote.

After this gain of four States in six years by the suffragists the opponents took active measures to prevent the submission of the question in other States. In the few cases where this was done the combination of corporations, liquor interests and party "machines" was impossible to overcome. The domination of politics by these forces was so complete that there was no chance for any moral questions, and nothing was left but the slow process of educating public sentiment to demand that the voice of women should be heard in this wilderness. Then came the great "insurgent" movement in the Western States and, as the direct result, the submitting of a woman suffrage amendment in 1910 by almost unanimous vote of the Washington Legislature. Here again there had been practical experience. In 1883 the Territorial Legislature gave to women the full rights of the ballot and at the spring election and again in the autumn they cast one-fourth of the votes, altho there were less than one-third as many women as men in the Territory. During the three and a half years that they possessed the suffrage the official returns several times showed a larger percentage of women than of men voting, even with all the physical handicaps of these pioneer days. In 1886, some question of constitutionality having arisen, the Legislature strengthened the Act. In 1887 the vicious elements secured a court verdict that the bill was not properly titled and the Legislature passed it a third time perfect in every respect.

A convention was about to prepare a constitution for statehood and these elements were determined it should not include woman suffrage. It was arranged that at the spring election of 1889 the vote of a certain saloon keeper's wife should be refused. Her case was rushed thru to the Supreme Court, and two out of three members decided that the equal suffrage law was void because a Territorial Legislature had no right to extend

the suffrage! The very Act under which Washington was organized specifically gave it this right, and under a similar Act women had voted twenty-one years in the Territory of Wyoming and seventeen in that of Utah. This decision is only matched by that in the Dred Scott case in 1857. The women were illegally disfranchised, they were excluded from the new Constitution and all they could obtain was the submission that year of woman suffrage as a separate question. They were not themselves allowed to vote on it and it was said to be defeated by over 19,000. Nine years later, in 1898, the women summoned courage to make another campaign and then the majority against them was announced to be considerably less than 10,000. Years afterward a man who had taken part in them stated publicly that the most barefaced frauds were committed and that the amendment really had been carried.

In 1910 came the political revolution in Washington, where the voters threw off the "machine" yoke and honest men of all parties secured a free election and a fair count. The women made the ablest campaign for the suffrage ever known, with the splendid result that it was carried in every county in the State and received a majority of nearly three to one —the largest victory ever achieved. The way in which they registered by the tens of thousands in Seattle the following month, "recalled" the Mayor, turned out the council and chief of police and regenerated the city—and later performed the same service for Tacoma—this is of too recent date to need extended mention. It advanced the cause of woman suffrage thruout the whole country and across the ocean on either side.

The first results were seen in California, which in the State at large had been swept clean of its corrupt political forces by the great wave of insurgency. The press representatives who had been going to Sacramento for years said they never had seen so able, sincere and upright a body of men as the legislators who submitted the reform amendments, all of which were adopted at the recent election, including woman suffrage. The women remembered with anguish of spirit the magnificent campaign they had made in 1896 only to be betrayed and sold by the political leaders. With largely augmented numbers and full of faith in the new order they made the fight, but it required the decent men of the whole State to overcome the corrupt vote of San Francisco and Oakland. Now in a State that has been in the Union over sixty years, and in several big cities, we shall have the supreme test of woman suffrage. Will another year see victory in Oregon and women enfranchised on the entire Pacific Coast?

NEW YORK CITY.

# November Love Song

BY ELIZABETH WEST PARKER

WHEN first you told your love for me,
How well do I remember!
It was a melancholy day,
It was in sad November.
Amid the leafless trees you vowed
To be my brave defender;
Only a wand'ring chickadee
Saw lovers kiss each other.
He sang his little song of joy,
The sweetest note of winter,
And with his song your words of love
To me will mingle ever,—
"Chick-a-dee, chick-a-dee,
I love but thee;
Chick-a-dee-dee-dee,
You're the world to me."

Let others sing the love of June.
Give me the love that ever
Makes summer bloom in winter's heart.
And May of bleak November.
The years have come, the years have gone,
But still your love has never
Made aught but sunshine in my heart
Or in our lives together.
And always when the chickadee
Sings his sweet note of winter
I hear your words of love and truth.
That have been faithful ever,—
"Chick-a-dee, chick-a-dee,
I love but thee;
Chick-a-dee-dee-dee,
You're the world to me."

WOBURN, MASS.

# Japan and America

BY. HAMILTON HOLT

[On Monday, September 25, a banquet was given in Tokio to Mr. Lindsay Russell, president of the Japan Society of New York, and to Mr. Hamilton Holt, managing editor of THE INDEPENDENT. Addresses were made by Prince Tokugawa, president of the House of Peers; Baron Shibusawa, the leading figure in Japan's new commercial expansion; Baron Ishii, the Vice-Minister of Foreign Affairs; Baron Kanda, Mr. Lindsay Russell and Mr. Hamilton Holt. A distinguished group of Japanese statesmen and officials were present. We reprint herewith Mr. Holt's speech.—EDITOR.]

THE peace movement, we have now come to realize, is nothing but the process of substituting law for war. Peace is the outcome of justice, justice of law, law of political organization. The world has already learned to substitute law for war in hamlets, towns, cities, states, and even within the forty-six sovereign civilized nations. But in that international realm over and above each nation, in which each nation is equally sovereign, the only way at the present moment for a nation to secure its rights is by the use of force or by war. In other words, the nations are now in that state of civilization where without a qualm they claim the right to settle their disputes in a manner for which they would actually put their own subjects to death for imitating. Thus the peace problem is nothing but the ways of means of doing *between* the nations what has already been done *within* the nations.

At the present moment international law has reached about the same state of development that private or municipal law had attained in the tenth century. Furthermore, a careful study of the formation of the original thirteen American colonies with our present compact union or United States discloses the fact that the nations today are in much the same stage of development that the American colonies were at the time of their first confederation at the end of the seventeenth century. As the United States came into existence by the establishment of the Articles of Confederation and the Continental Congress, so the "United Nations" at this very moment existed by the fact of the Hague Court and the recurring Hague conferences, the Hague Court being the promise of the Supreme Court of the World, and the Hague Conference being the prophecy of the Parliament of Man. We may look with confidence to a future, therefore, in which the world will have an established court with jurisdiction over all questions, and of governing conferences with power to legislate on all affairs of common concern, and perhaps an executive power of some sort—individual or collective—to carry out the decrees of both. To deny this is ignoring all the analogies of private law, and the whole trend of the world's political history since the Declaration of American Independence.

The political organization of the world, therefore, is the task of the twentieth century. But the formation of a competent world government, with adequate executive, legislative and judicial functions, must be a very slow business. Such a federal government would be, as the historian Freeman has said, "the most finished and artificial production of political ingenuity." To accomplish this is surely not the work of a day or years, and we must go step by step.

How then can this inevitable goal be reached? There are only two ways. First, the education of the public opinion of the world, so that the nations can move forward at successive Hague conferences or at special international conferences; and second, by a few of the more enlightened and progressive nations organizing themselves for peace in advance of the others. The methods of educating public opinion have received much attention in the United States. We not only have sixty-five peace societies now in existence—some of them very active, but the chambers of commerce and boards of trade, the labor unions, the agricultural associations, or the grange, and of course the churches and

MR. HOLT DELIVERING HIS ADDRESS
The banquet took place at the Imperial Hotel, Tokio. Mr. Holt is standing and on his right is Prince Tokugawa, who presided.

universities, all vie with one another in actively supporting the movement. Hundreds of lectures are given before churches, universities and various political, economic, financial and social clubs every year, and literally millions of peace pamphlets are distributed thruout the land, while the newspapers and magazines teem with discussions pro and con written by distinguished American and foreign publicists. The American Peace Society, established in 1815, the oldest peace society in the world, has now a United States Senator for its president, and an income of nearly 40,000 yen a year. The New York Peace Society, of which Mr. Carnegie is president, spends about 30,000 yen yearly. The World Peace Foundation, founded by the eminent Boston publisher, Mr. Edwin Ginn, enjoys an income of 100,000 yen a year. Dr. Jordan and I have the honor of being directors of this society. And Mr. Carnegie's princely benefaction of 70,000,000 yen is known to the whole world and has aptly been characterized as the first Dreadnought in the navy of peace.

The Carnegie Peace Endowment is now organized in three great departments—the economic department, the judicial department and the department of education. The economic department held its first meeting in Berne, Switzerland, a few weeks ago, and was attended by a score of the most distinguished economists of the whole world. Baron Sakatani, as you know, was the Japanese delegate to this conference. These economists have drawn up plans by

which the whole peace movement will be scientifically studied, and they will publish the results of their investigations from time to time. The judicial department will shortly, I understand, convene a similar conference of constitutional and international lawyers, while the department of intercourse and education has recently assumed charge of the Japanese exchange lectureships inaugurated between Japan and the United States, and of which Dr. Nitobe is the first exchange lecturer.

These peace societies and others have in their membership the most distinguished men and women in the United States, and last May the President of the United States himself for the first time in history left the capital and actually journeyed to Baltimore to open a national peace congress. But, best of all, the American Government is now taking as progressive a stand for peace as the most ardent private pacifist. President Taft, as you know, is now attempting to negotiate with England and France treaties of unlimited arbitration. I learn that it is held in some quarters here that these treaties are practically dead because the Senate did not confirm them at its recent session. This is a mistaken view, I am glad to think. We all expect the Senate to ratify them next winter, for the whole country is aroused and is supporting the President, and the Senate has to bow eventually to the popular will. When Admiral Togo was in the United States a few weeks ago—and I have never known of a foreigner receiving a more cordial and enthusiastic welcome from our Government and people—President Taft publicly thanked Japan for consenting to a modification of the Anglo-Japanese alliance so as to permit England to make this peace treaty with us. President Taft also exprest the hope that Japan would join with the United States in a similar treaty. The President has furthermore been negotiating with the leading Powers to see if ways and means can be devised for establishing before the third Hague Conference, to be assembled in 1915, the Judicial Arbitration Court that was created at the Second Hague Conference, but not actually established owing to the difficulty of finding a way to select the judges. The President has also before him a joint resolution passed by Congress authorizing him to appoint an official peace commission of five members to study the whole question of armaments and "to report on any other means to diminish the expenditures of governments for military purposes and to lessen the probabilities of war." Mr. Taft has not yet appointed this commission, as he is awaiting the expressions of foreign governments as to their willingness to co-operate with him by the appointment of similar commissions. This is a very significant move on the part of the United States Congress, and has not received the attention it deserves in other countries. When the commission is appointed it will be the first time in history when a great nation in time of peace will prepare for peace.

In conclusion may I venture to express the hope that Japan will negotiate a treaty of unlimited arbitration with us just as soon as our Senate ratifies the treaties with England and France? But if our Senate should be so unenlightened as to withhold its confirmation, there would be nothing, I think, to hinder Japan from negotiating such a treaty with some other friendly Powers.

Japan and the United States ought to lead in this great movement. They have no historic hatreds and prejudices such as entangle and vex many of the nations of Europe. They are the two greatest Powers of the Pacific—the ocean destined to play the greatest role in the future of the world's civilization. With Japan and America bound each to each by an unlimited arbitration treaty and striving shoulder to shoulder for the world's peace, who can doubt but that the time would be hastened when, as Victor Hugo prophesied it, "the only battlefield will be the market opening to commerce and the mind to new ideas."

TOKIO, JAPAN.

# In Zanzibar

BY E. ALEXANDER POWELL, F.R.G.S.

[We are glad to introduce to our readers Mr. Powell, who on diplomatic and journalistic missions has witnessed the Cretan Insurrection, the Armenian troubles, the French occupation of Morocco and the Persian revolution. Two years ago he traversed Central Asia and has just returned from a year in Inner Africa. Mr. Powell, who is a Fellow of the Royal Geographical Society, is now preparing a volume dealing with African affairs, entitled "The Last Frontier."—EDITOR.]

THERE is no name between the covers of the atlas more redolent of romance and adventure. Ever since Livingstone entered the African jungle on his mission of proselytism; ever since Stanley entered the same jungle on his quest of Livingstone; and ever since the railway builders began to run their levels and lay their rails along the trail blazed by them both, Zanzibar has been the gateway thru which Christianity, civilization and commerce have entered the Dark Continent. Tho its area has been steadily lessened by spoliation, treaty and purchase, until the sultanate, which once extended from Cape Guardafui to Delagoa Bay and inland to the Great Lakes, has dwindled to two coastwise islands in the Indian Ocean, Zanzibar, the capital, is still the most important place, politically and commercially, in all East Africa, and one of the most picturesque cities in the world. It bears the impress of the many kinds of men, of many nationalities — Arab sultans, slave traders and pirates, Portuguese merchants, European explorers and ivory hunters—who have swaggered across the pages of its history.

Seen from the harbor, Zanzibar has little to commend it. So uninviting, indeed, is the face that it turns seaward, that the story is told of an American politician sent there as consul, who, after taking one look from the steamer's deck at the sun-baked town, with its treeless, yellow beach and its flat-roofed, whitewashed houses, refused to go ashore at all. Tho a city of 100,000 people, with practically all the trade of East Africa in its hands, Zanzibar has neither dock, jetty nor wharf, passengers and packages alike being disembarked in small boats and carried thru the surf on the shoulders of Swahili boatmen. There is no word in the language adequate to describe the scene which takes place on the beach bordering the harbor when a mail steamer comes in. The passengers—white-helmeted tourists, pompous, drill-clad officials, sallow-faced Parsee merchants, chattering Hindu artisans, haughty, hawk-nosed Arabs, cotton-clad Swahilis from the mainland—are unceremoniously dumped with their belongings on the sand, where they instantly become the centers of shouting, pleading, cursing, struggling, gesticulating, perspiring mobs of porters and hotel runners, from whose rough importunities they are rescued only by the efforts of a dozen *askaris,* who lay their rhinoceros-hide whips about them indiscriminately.

When a poor imitation of order has been restored and the luggage has been rescued and sorted, you start for the hotel—there is only one deserving of the name — with a voluble hotel-runner clinging to your arm as tho afraid you would break away, and followed by a miniature safari of porters balancing trunks, hat-boxes, kit-bags, gun-cases, bathtubs and the other impedimenta of an African traveler on their turbaned heads. Returning the ostentatious salute of the tan-colored sentry at the head of the water-stairs, you follow your guide thru a series of tortuous and narrow alleys, plunge into the darkness of an ill-smelling tunnel, and suddenly emerge, blinded with the sun-glare, into a thorofare lined on either side with tiny, fascinating, hole-in-the-wall shops, whose owners rush out and proffer you their silver, ivory and ostrich feather wares vociferously.

Quite unexpectedly the procession halts under a swinging sign bearing the legend "Afrika Hotel." The proprietor, a rotund, red-cheeked German who looks as if he had stepped straight out

of a Munich beer garden, escorts you pantingly up two—three—four flights of stone stairs, lined on either side with strange native weapons and East Coast curios, to a brick-floored cell under the roof, there being more likelihood of catching an occasional breeze, he explains, at the top. The furniture, monastic in its simplicity, consists of an iron bed, an iron table, an iron chair and an iron washstand supporting a tin bowl and pitcher, anything not of metal standing an excellent chance of destruction by the swarms of white ants. The bed is draped with a mosquito netting of so fine a mesh that the air within feels strained and unnourishing, like milk that has been watered, and the heavy shutters are closed in a fruitless attempt to keep out some of the stifling midday heat, tho the proprietor, after glancing at the thermometer, remarks that it is not as warm as yesterday, being only 110.

You are advised to go to bed in the dark, as a light would attract the mosquitoes, and never, never, under any circumstances, to get into bed without assuring yourself that there are no mosquitoes inside the curtains, tho he reassuringly adds, "But you can only get fever from the black-and-white striped ones." Likewise, you are solemnly warned never to go out-of-doors during the day without a topée lest you die from sunstroke (I knew one man who took off his helmet long enough to wave good-bye to a departing friend and was dead in an hour in consequence); never to drink other than bottled water (at two rupees the bottle) lest you die from typhoid; never to stay out-of-doors after nightfall lest you contract malaria; never to put on your boots without first shaking them out lest a snake or scorpion has chosen them to spend the night in; and never to put your revolver under your pillow, where it cannot be reached without attracting attention, but to keep it beside you in the bed, so that you can shoot thru the bedclothes without warning if you should wake up to find an intruder in your room.

The best and most interesting thing about the Afrika Hotel is its bath, a forbidding, stone-floored room, totally devoid of tub or furniture. You clap your

BUBUBU—A SUBURB OF ZANZIBAR

THE ZANZIBAR NAVY: THE STONE SHIP BEFORE THE SULTAN'S PALACE

hands, which is the East Coast equivalent for pressing a button, and in prompt response appears an ebony skinned domestic bearing on his head a Standard Oil can filled with water. Running thru a staple in the ceiling is a rope, and to the end of this rope he attaches the can, hoisting it until it swings half a dozen feet above your head. Hanging from a hole in the side of the can is a cord. When you are ready for your bath you stand underneath the can, jerk the cord sharply, and the can empties itself over you like a waterspout. Then you clap your hands and wait until the Swahili brings more water, when you do it all over again.

The first thing the visitor to Zanzibar does after arriving is to bathe and put on a fresh suit of white linen, for to appear presentable in the terrible humidity of the East Coast requires at least six white suits a day; and the second thing he does is to call on the consul, a very homesick young gentleman, who is so glad to see any one from "God's country" that he is only too willing to spend his meager salary in entertaining them. If it is drawing toward sunset you will probably find him just starting for the golf club, which is the rendezvous at nightfall for Zanzibar's European society, whose chief recreations, so far as I could see, are golf, gambling and gossip. With a sturdy, khaki-clad Swahili, a brass American eagle on the front of his fez, trotting between the shafts of the consular 'rickshaw (the Department of State refuses to appropriate enough money for carriage hire), and another pushing behind, you whirl down the bright red highway which leads to the suburb of Bububu; past the broad verandaed residency from which the British consul-general gives his orders to the little brown man who is permitted to play at ruling Zanzibar; past the police barracks, where, at sight of the eagle on the 'rickshaw coolie's fez, the sentry on duty shouts some unintelligible jargon, a bugle blares and a group of native constables spring into line and bring their hands smartly to the salute as you pass; past the Marconi station on the cliff, where the wireless chatters ceaselessly with Bagamoyo and Kilindini and Dar-

es-Salam; until you come to a sudden halt before a bungalow, almost hidden in a wonderful tropic garden, whose broad verandas overlook an emerald velvet golf course stretching from the highway to the sea.

Playing golf in Zanzibar always struck me as being the most incongruous thing I ever did. It seems as tho one ought to devote their energies to pirating or pearl fishing or slave trading in a place with such a name. Moreover, there is such a continuous circus procession passing along the highway—natives in *kangas* of every pattern and color; Masai and Swahili warriors from the mainland; Parsee bankers in victorias and Hindu merchants in 'rickshaws; giant privates of the King's African Rifles in bottle-green tunics and blue puttees; veiled women of the Sultan's zenana out for an airing in cumbersome, gaudily painted barouches, preceded and followed by red-jacketed lancers on white horses; perhaps his Highness himself, a dapper, discontented-looking young mulatto, whirling by in a big gray racing car—that it is quite out of the question to keep your eye on the ball and you play very bad golf in consequence. Another trouble is that the caddies are all natives, and golf is discouraging enough in itself without having to shout "Fore!" or ask for a mashie or a putter in Swahili.

After a perfunctory round or two you go back to the clubhouse veranda, where the European society of Zanzibar is seated in cane chairs, with the English weeklies, and tall glasses with ice tinkling in them. The talk is the talk of exiled white folk everywhere: the news contained in the Reuter's cables which are posted each evening on the club bulletin board; the condition of the ivory market; the prospects for big game shooting in German territory; the favorites for the next day's cricket match, the next week's polo game or the next month's race meet; the latest books, the newest plays—as gathered from the illustrated weeklies; what is going to become of Smyth Cunninghame's widow, whose husband just died of fever; is it true that Major Buffington has been transferred to a line regiment? and is Germany really looking for war?

That night the consul gives a dinner for you at the Zanzibar Club, where you are served by bare-footed servants immaculate in crimson turbans and white linen, and eat with solid silver from irreproachable china, in a room made almost comfortable by many swinging punkahs. After dinner you sit on the terrace in the dark, somewhere between the ocean and the stars, and over the coffee and cigars you listen to strange stories of "the Coast," told by men who themselves played a part in them. One man tells you what Stanley really said when after months in the jungle without seeing a white man's face, he finally stumbled on the camp of Livingstone, and how, instead of rushing up and throwing his arms around him and crying: "Saved at last, old fellow; saved at last!" he lifted his helmet at sight of the gaunt, fever-stricken man sitting in front of the tent, and said, just as he would if accosting a stranger in Fifth avenue or Piccadilly: "Doctor Livingstone, I believe?" Another, a wiry, bright-eyed Frenchman, with a face tanned to the color of mahogany, tells of the days when the route from Tanganyika to the coast was marked by the bleaching skeletons of slaves, and he points out to you, across the house tops, the squalid dwelling where Tippoo Tib, the greatest of all the slave dealers, died. A British commissioner, the glow of his cigar lighting up his ruddy face, his scarlet cummerbund and his white mess jacket, relates in strict confidence a chapter of secret diplomatic history, and you learn how the German Foreign Office shattered the British dream of an all red Cape-to-Cairo railway and why England is so insistent on the Congo being placed under international control. Then a Danish ivory hunter breaks in, and you hear all sorts of wild tales of life on safari, of ivory trading in the Lado Enclave, of brushes with the Uganda police south of Gondokoro, and of strange tribal customs practised in the hinterland. When the dawn begins to creep up out of the east, the Englishmen tell the drowsy steward to bring them "Scotch and sodas," and the Frenchmen order absinthe, then every one shakes hands with every one else and you make your way back to your hotel thru the narrow,

IN THE ABSENCE OF WHARFAGE, PASSENGERS AND FREIGHT ALIKE ARE CARRIED ASHORE ON THE SHOULDERS OF NATIVES

silent streets, returning the salute of the night constable sleepily.

No visitor leaves Zanzibar without going to the cemetery. Like the palace and the stone ship built by a former Sultan, it is one of the show places of the town. I saw it under the guidance of a gloomy British official, who said that he always walked there every evening "so as to get used to the place before staying in it permanently." He led me across the well kept grass to two newly dug graves, each covered with wooden hoods, which were evidently part of the cemetery's equipment. He said nothing, but waved his hand in a "take your choice; they're both ready" gesture. "Two deaths today?" I queried. "Not yet," said he; "but we always keep two graves ready dug for Europeans. In this climate, you know, we have to bury very quickly." For in Zanzibar, as all along the East Coast, the white man's hardest fight is with a foe he can feel only as a poison in his burning veins, and can see only in the dreams of his delirium—the dread African fever.

Tho the streets in the outskirts of the city are wide, well shaded and excellently macadamized with some kind of bright red soil, the business portion of the town, where the natives chiefly live, is a wilderness of narrow streets and dim bazaars, hemmed in with tiny shops and wretched dwellings, with here and there an ancient Portuguese house, impregnable as a feudal castle, the massive doorways of exquisitely carved teakwood in strange contrast to the surrounding squalor. Every shop is open to the street, and half of them, it seemed to me, are devoted to the sale of ivory carvings, ostrich feathers, brassware and silverwork, tho the Arab workmanship is in all cases poorly executed and crude in design. Zanzibar is still the chief ivory market of the world—the supplies of both elephant and rhino ivory, I was assured by British officials, steadily increasing rather than diminishing—the crude images of African animals which the natives carve from the coarser grades of ivory making charming, tho costly, souvenirs. Nothing is cheap in Zanzi-

bar, or, for that matter, anywhere else in Africa, and every purchase is a matter of prolonged and wearisome negotiation, the merchant fixing a fantastic price and lowering it gradually, as he thinks discreet, his rock-bottom figure depending upon the behavior and appearance of the customer.

The population of Zanzibar is pretty evenly divided between Arabs and Swahilis, with a considerable sprinkling of East Indians, who play the same rôles of peddlers, petty tradesmen and money lenders in the Orient that the Jews and Armenians do in the Occident. The dress of the Swahili is as simple as it is striking: two lengths of cotton cloth, called *kanga,* one draped about the loins and the other about the shoulders. These *kangas* are crudely stamped in innumerable striking designs, some of the more elaborate patterns looking, from a little distance, as tho embroidered. The inventiveness of the designers must be sorely taxed, for the fashions in Zanzibar change as rapidly as they do in Paris, and with as little warning, the *kangas* stamped with card-pips—hearts, diamonds, clubs and spades—which were all the rage for a time, suddenly giving way to those bearing rough prints of sailing ships or verses in Arabic from the Koran. One negro dandy paraded the streets, the envied of all his fellows, wearing a *kanga* on which was repeated, in glaring colors, the British coat of arms and the motto "God Save the King." The Swahili women, in addition to the *kanga* proper, wear cotton pantalets, edged at the ankles with neat little frills, for all the world like those the chefs at fashionable restaurants put on lamb chops.

The Arabs, on the other hand, recall in their costumes all the stories of pirates and slave traders which one associates with Zanzibar, for the men, ignoring the prohibition against carrying arms, swagger insolently thru the streets with dagger-filled sashes and trailing scimeters, their white jibbahs flapping about their sandaled feet and their snowy turbans cocked rakishly. The dress of the Arab women of Zanzibar resembles the costume of no other people, its most striking features being the immense, doughnut shaped turbans and the frilled, skin-tight trousers striped like barber poles.

The universal medium of communication in Zanzibar and along the East Coast is Swahili, this *lingua franca* being generally used not only between Arabs and natives and between natives and Europeans, but between Europeans themselves, the French, English and Portuguese traders doing business in German East Africa depending entirely upon Swahili for conversation with the Germans. I remember once, in Dar-es-Salam, hearing an Englishman and a Frenchman hold an animated conversation, and later on bargain with the German hotelkeeper for accommodation in this same outlandish tongue.

The morning before you leave you go with the consul to call on his Highness Seyyid Ali bin Hamoud bin Mohammed, the Sultan of Zanzibar. The 'rickshaw stops with a jerk in front of the iron gates; the palace guard turns out and presents arms, while a negro bugler sounds a barbaric fanfare; an official in white duck and much gold lace meets you at the entrance and escorts you up flight after flight of heavily carpeted stairs, until you emerge, perspiring and breathless, on the breeze swept upper veranda of a four-story building, which looks more than anything else like an American summer hotel. After a quarter of an hour spent in smoking perfumed cigarets, another official announces that his Highness will receive you, and you are ushered into a small room furnished like an office, where a pleasant-looking young mulatto of twenty-six is sitting at an American roll-top desk dictating letters. Like every one else, he is in white linen, with a red tarboosh, gold shoulder-straps and pumps of white buckskin. He motions you to a seat and offers you more of the perfumed cigarets, inquiring, with the accent of Oriel College, Oxford, as to the state of your health, when you arrived, what are your impressions of Zanzibar, when you leave and where you are going. As you are bowing yourself out, after ten minutes of this perfunctory conversation, the Sultan's English secretary sidles up and whispers, "His Highness expects that you will give him the pleasure of staying to luncheon." So you race back to your hotel, get into a fresh suit of duck, and hasten back to the palace.

The luncheon is very much the same as you would get at Claridge's or the Cafe de Paris, except that, for your special benefit, a few native dishes with strange names and still stranger flavors have been sprinkled in. The wines are irreproachable and the Hodeidah coffee and Aleppo cigarets could be had nowhere outside the East. Your eye is caught by the magnificence of the jewel-monogramed cigaret case which the Sultan constantly passes to you, and you venture to comment on it admiringly. "Do you like it?" says he, with a pleased smile. "It is only a trifle that I picked up last spring in Paris. Accept it from me as a little souvenir of your visit—really—please do." Quite naturally you hesitate, as who would not at accepting offhand a thing worth a thousand rupees. The Sultan looks disappointed. "It is not worthy of you," he says. "Some day I shall send you something more fitting." And he puts it in his pocket. All the rest of your stay in Zanzibar you keep thinking how near you came to getting that magnificent case, and it almost spoils your visit. As you leave the palace the military secretary inquires, "Why didn't you take the cigaret case when the Sultan offered it?" "Natural hesitation," you reply. "In the East you should accept first and hesitate afterward," he answers.

After luncheon you play billiards with the Sultan. He is a good player and it is no trouble at all to let royalty win gracefully. Incidentally he mentions that he is about to be married. Later on the English secretary supplements this by explaining that his latest bride—he already has three wives—is the fifteen-year-old daughter of a well-to-do merchant in the bazaars, with whom the Sultan has been haggling regarding the price to be paid for the girl for nearly a year. After a time you stroll out on the breeze-swept veranda. As you lean over the rail you notice something sticking up out of the harbor and you point to it. "What is that, your Highness?" you inquire. "A wreck," he answers shortly. "A wreck! A wreck of what?" you persist. "The wreck of the Zanzibar navy," he says, turning away—and you suddenly recall the story of the little gunboat, with its negro crew, that stood up to the great British cruiser and banged away with its toy guns until it was sent to the bottom with every man on board, and all at once you feel very sorry for this youth, whose fathers held sway over a dominion as large as all the States west of the Rocky Mountains put together, but which, thanks to the insatiable land-hunger of the European nations, has dwindled to a territory scarcely larger than Rhode Island.

That in the not far distant future Zanzibar will again play a part in international politics there is but little doubt. The island's position adjacent to the mainland, from which it is separated by a channel less than thirty miles wide, and the advantages of its deep and roomy harbor, mark it naturally as the chief entrepot of all East Africa, and the gate thru which commerce, religion and civilization are destined to open up the interior of the continent to European exploitation and settlement. Being almost equi-distant—some 2,400 miles—from India, the Cape and the Canal, and controlling the lines of cable communication with Madagascar and Mauritius, it affords a strategic position of immense importance as a naval base in the contingency of closing the Suez Canal in time of war. Germany has long had a greedy eye on Zanzibar; desiring it, indeed, more than anything else in Africa, for the nation that holds it controls, both strategically and commercially, Germany's East African possessions and their flourishing capital, Dar-es-Salam. That England would be willing to turn Zanzibar over to Germany in return for the cession of a strip of territory thru German East Africa which would permit the completion of her long dreamed of, and at present indefinitely interrupted, Cape-to-Cairo trunk line, there is considerable reason to believe. So I trust that the little brown man in the white and gold uniform will enjoy playing at sovereignty while he may, for on that day when the red banner on his palace flagstaff is replaced with the black and white standard of Germany, there will pass into the pleasant oblivion of the Paris boulevards the last of a long line of one-time powerful, ofttimes piratical, but always picturesque rulers, the Sultans of Zanzibar.

New York City.

# Literature

## The Spanish-American War

A VERY valuable contribution to the history of the Spanish-American War has just been published by Charles Scribner's Sons.* It is a work in two volumes, written by Rear-Admiral Chadwick, who states in his preface that it "is intended in the main as a documentary history." The period covered is from January, 1898 (three months before the declaration of war) to December of the same year, when the treaty of peace was signed, and the situation as it existed during that period is described with marked impartiality, conscientious accuracy, and a comprehensive understanding of the multitudinous conditions, circumstances and events on land and sea that strengthened or impaired the capacity and capability of the military and naval forces of each of the belligerents, that gave victory to the United States and that terminated the war. Very properly, no elaborate consideration is given in the work to the causes of the war nor to the effects it is likely to produce. The war itself is the author's theme.

REAR ADMIRAL F. E. CHADWICK
Author of "The Relations of the United States and Spain." (Scribner.)

It is not generally known that our Navy Department for a time contemplated seizing the Canary Islands and using them as a base for sending our ships to the coasts of Spain, with the object of beginning and ending hostilities in the home ports of the enemy. The plan, if it had been carried out, would doubtless have resulted as successfully as Dewey's battle in Manila Bay, and we should have been spared many of the mortifications that the Cuban campaign brought us. Admiral Chadwick does not mention that plan; but he furnishes the explanation why it was not carried out in stating that Cuba was made the main battleground by the terms of the joint resolution of Congress of April 19, 1898, which demanded that Spain relinquish at once her authority and government in the island of Cuba. When war was declared, therefore, the principal object of every move, as he points out, of the United States, whether in the Philippines, Porto Rico or elsewhere, was to secure the withdrawal of Spanish rule from Cuba.

While exceptionally generous in his praise of the leaders of our own military and naval forces and of those of Spain, Admiral Chadwick is equally frank in his adverse criticisms, as, for instance, when he describes the inferiority of the Spanish fleet in gun fire and armor protection, and calls attention to "the defective system" of our departmental administration. His comparisons of the ships and their crews, of the land forces, and of the strategy of the commanders, and his descriptions of the battles that were fought, are impressively adequate. The many jealousies and controversies that arose during the war seem to have made

*The Relations of the United States and Spain: Diplomacy. By Rear-Admiral French Ensor Chadwick, U.S.N. (Retired). New York: Charles Scribner's Sons. 2 vols.

but little impression on his mind, and they become very insignificant as he presents and discusses the events that inspired them. One cannot, after a careful perusal of the work, put it down without concluding that as a succinct history of the war it will never be surpassed, and in all probability never be equaled. HERBERT W. BOWEN.

**The Standard of Living.** By Frank H. Streighthoff. Boston: Houghton Mifflin Co. $1.

**Making Both Ends Meet.** By Mrs. Sue Ainslie Clark and Edith Franklin Wyatt. New York: The Macmillan Co. $1.50.

Mr. Streightoff has brought together, in a form easily digestible by the student of economics, though too tough for the casual reader, the chief facts and the results contained in the best investigations that have been made into the standard of living of the wage-earning classes in America. He presents a composite photograph of the American industrial people, their food and clothing, the houses they occupy, the pleasures they indulge in, the wages they earn, and the little vanities and ambitions they cherish. It is a disquieting picture, destructive of that complacent optimism which thinks America is a paradise for the man whose hands are his fortune. "It is conservative to set $650 as the extreme low limit of the living wage in cities of the North, East and West. Probably $600 is high enough for the cities of the South. At this wage there can be no saving and a minimum of pleasure. Yet there are in the United States at least five million industrial workmen who are earning $600 or less a year." Despite, then, of the prodigal wealth of the country, of bountiful harvests, amazing machinery, labor-saving devices, cheap land and convenient climate, there are millions of citizens who never get a surplus, who are not fully nourished, who can spare hardly a nickel for religion or amusement. It is a miserable consolation that in Europe the laborers are even worse off, that, despite all privations, the population continues to increase, and that, by miracles of management, families of talent, like the Beechers, have been reared on scanty incomes. Even averages do not reveal the blackest shadows, however, as *Making Both Ends Meet* illustrates. The authors have made intensive and interesting studies of the conditions of women workers in stores, factories and laundries in New York, whose struggle to make both ends meet is pitiably tragic. "If they can't make both ends meat, why don't they make one end vegetables?" a cynic has asked. Even with both ends vegetables, at the present high prices in big cities, the pitiful dollar or two that rewards a week's toil would hardly be sufficient to keep body and soul together. Ignorance, low skill, even lower wages, unemployment, ill-health—with this troop of handicaps what wonder that girls "are unstrung and nervous in this hardness of circumstance and terror of destitution." Trade union organization is the best weapon for betterment that is disclosed, for thru in the cloak makers and the shirt-waist makers won the strikes that are picturesquely portrayed, and hope entered the breasts of hundreds of the forlorn. Legislation improved the lot of the laundry workers after the revelations, and scientific management has increased the wages as well as the output in a few factories. These are the gleams of light in a sky bitterly black.

**The Outcry.** By Henry James. New York: Charles Scribner's Sons. $1.25.

An English nobleman with an inheritance of a rare picture collection is blessed also with a daughter "too dazzlingly, dreadfully beautiful," and this daughter owes debts—chiefly for bridge—in "incredible amounts." "And he *has* to pay them? There's no one else?" asks the art critic who is in love with the other daughter. "He's only afraid there *may* be some one else—that's how she makes him do it," she replies. Besides the daughters and their lovers there is the rich Bender—American collector. "It's too damnable!" says the art critic, with vigor. The young man was not, to be sure, speaking of Mr. James's novel, which other critics might not otherwise qualify. We commend *The Outcry* for an infamous debauch of adverbs, challenging comparison with other examples of its author's work. It is colossal in its indirection.

**Checking the Waste.** A study in conservation By Mary Huston Gregory. Indianapolis: The Bobbs-Merrill Co. $1.25.

This does not profess to be an original contribution to the subject, but as a general survey of wide scope it will be useful to the general reader. The wording is simple and the explanations elementary, so that the book could well be used by the students in high schools, especially those of the new agricultural type, for reference and side reading. All kinds of waste are considered; the exhaustion of the soil, the destruction of the forests, the non-utilization of water power, the excessive consumption of coal, oil and gas, the robbing of ores, the injury by insects, the ravages of disease and the sacrifice of natural beauty. References to books, bulletins and reports are appended to each chapter, but these could have been made more valuable if their character and relative value had been noted in each case.

**Louisiana under the Rule of Spain, France, and the United States, 1785-1807**—as portrayed in hitherto unpublished contemporary accounts. Edited by James Alexander Robertson. 2 vols., Cleveland, Ohio, Arthur H. Clark Co., $10.

We hope, tho without undue confidence, that Dr. Robertson's new volumes are a correct sign of the times, and that there is a buying public ready to take the beautiful volumes in which the Clark Company has set these new documents on the Louisiana Purchase. Fine, generous, broad-margined books they are, that leave nothing to be desired in their physique; while the high standing of their editor as a scholar of accuracy and judgment promises well for their intellectual content. Yet, after all, they are documents—the raw material out of which history is made rather than history itself. They are disjointed, because they come from many independent sources. They are chosen for their facts, not for their form or phraseology, and

WHAT IRRIGATION CAN DO

From a photograph taken at Redlands, San Bernardino County, California, for Gregory's "Checking the Waste" (Bobbs-Merrill Co.)

where the editor has had to translate there is a stiffness that may discourage amateurs. If it is a financial possibility to print documents as these are printed, history must have many friends and the buying public must be large. The papers themselves are a useful supplement to the collection of diplomatic papers relating to Louisiana which Congress printed a few years ago. It has been easier to find books about Louisiana than to reach the sources upon which alone they could be founded. Indeed, many of the contributors to the portentous list of "Louisianana" have proved in their writings how rare has been the knowledge of the source. With Dr. Robertson's volumes before him, none need now accept the secondary word. The materials for independent judgment are available.

KURDISH WARRIORS
From Ponafidine's "Life in the Moslem East" (Dodd, Mead & Co.)

**Life in the Moslem East.** By Pierre Ponafidine. Translated from the Russian by Emma Cochran Ponafidine. Numerous Illustrations. Pp. 429. New York: Dodd, Mead & Co. $4.

So formidable a volume as that signed by the Imperial Russian Consul-General in Constantinople, who formerly occupied similar posts in various parts of Persia and Turkey, deserves a well-made index; even tho it be, in the translator's words, "not a pretentious history," but rather "a series of studies of certain phases of the life, religion and customs" of people among whom the author has passed the thirty-six years of his consular service. Obviously this is a work of more than common import, and as it happens, timeliness is one of the qualities of the chapters devoted to Persia. These chapters do not directly deal with the constitutional problems of that land, and those of international relations; but with the position of woman in Persia and in other parts of the Moslem world; with Persian feast days and fast days; with religious pilgrimages, law proceedings, and ideas of retaliation. This interesting book is, indeed, strongest on the social side, and it deals not with Persia alone, but with Arabia, Mesopotamia, the inhabitants of the Desert, and with certain aspects of life in the Indian Empire. The style is informal and even anecdotal; but we welcome anecdote when offered by one so well qualified to judge of the value of what he offers.

No doubt Mr. Ponafidine has left unsaid some of the things he ought to have said; but in spite of his official position he has written an altogether unofficial, albeit an instructive and diverting volume.

**Business.** By Charles Edward Russell. New York: John Lane Company. $1.50.

Mr. Russell examines Business from a new point of view. With his customary forceful eloquence and intense conviction he shows how Business Interests of necessity dominate Government, for "the fact remains that Business, of which the Interests are an inseparable part and expression, is at present the sole means of supplying man with the necessaries of his life, and in the face of that fact all campaigns against it are obviously doomed to failure." Tho a Socialist, Mr. Russell protests against the constant interference with Business, the efforts to "check evolution" by dosing Business with "Dr. Sherman's Celebrated Herb Tea for Trusts and Boils.' The injunction of Uncle Sam to the Trusts: "Compete, confound you! Compete!" rouses the author's derision. Twenty years of threats have been unavailing; trusts thrive; the cost of living mounts ever higher. Business should be encouraged, not harassed; stimulated, not checked. But Business must be conducted for the common good, not for private profit. "So far it has operated to confer its benefits almost entirely upon its owners. The next obvious step is to operate it so that it will confer its benefits upon the country." And that involves public ownership of Business, the program of Socialism—which, introduced in this seductive manner, seems to lose its terrors.

**As I Remember.** Recollections of American society during the Nineteenth Century. By Marian Gouverneur. Pp. 416. New York: D. Appleton & Co. $2.

Mrs. Gouverneur, born Marian Campbell, records many interesting incidents in her "Recollections." She was born in Queen's County, Long Island, in the second decade of the last century, in an old-fashioned farmhouse purchased from Citizen Genet by Captain John Hazard, her maternal grandfather; but about 1828 her parents moved to New York. Her father was prominent in the social life of that city, and a man of solid connections. Mrs. Gouverneur's book is full of chat about things and personalities of New York, and she is especially interested in the leading families of the town—known to most people nowadays only thru the press. There is piquancy in some of her paragraphs—as in this:

"Henry Astor, the brother of John Jacob Astor, was the first of the family to come to America. . . . He was a private in the Hessian regiment that fought against our colonies in the Revolutionary War. After its close he decided to remain in New York, where he entered the employment of a butcher in the old Oswego market. He subsequently embarked upon more ambitious enterprises, became a highly successful business man, and at his death left a large fortune to his childless widow. Dr. Dix has stated that it was probably thru him that the younger brother came to this country. However this may be, John Jacob Astor sailed for America as a steerage passenger in a ship commanded by Captain Jacob Stout and arrived at Baltimore in January, 1784. He subsequently went to New York, where he spent his first night in the house of George Dieterich, a fellow-countryman whom he had known in Germany and by whom he was now employed to peddle cakes."

Mrs. Gouverneur does not confine herself, however, to writing about the humble beginnings of our "first families," and she writes, too, of other cities than New York. She has something to say of Washington in the middle of the nineteenth century, when, in the words of Mrs. Winfield Scott, it was "an ill-contrived, ill-arranged, rambling-scrambling village." There she enjoyed friendships with persons as dissimilar as Mrs. Winfield Scott, Charles Sumner and Miss Sally Strother. After her marriage to a grandson of James Monroe, Mrs. Gouverneur accompanied her husband to Foo Chow, China, where President Buchanan sent him as consul. During the Civil War Mr. and Mrs. Gouverneur lived at Frederick, Md., at a later date they removed to Washington once more. Her *mémoires pour servir* declare an unusually tenacious memory of persons and personalities.

**The Kitten's Garden of Verses.** By Oliver Herford. New York: Chas. Scribner's Sons. $1.

**The Lyrics of Eliza.** "Interpreted" by D. K. Stephens. New York: The Century Co. 50 cents.

**Kittens and Cats.** A Book of Tales. By Eulalie Osgood Grover. Boston: Houghton Mifflin Co. 75 cents.

Of the three writers about the cat world, Mr. Herford is incontestably the most truly kitten-wise. He proved his title

In Winter when the air is chill,
And winds are blowing loud and shrill,
All snug and warm I sit and purr,
Wrapped in my overcoat of fur

In Summer, quite the other way,
I find it very hot all day,
But Human People do not care,
For they have nice thin clothes to wear.

And does it not seem hard to you,
When all the world is like a stew,
And I am much too warm to purr,
I have to wear my Winter Fur?

"WHY IS IT THAT I NEVER HEAR
A PUSSEY-WILLOW MEW?"

From "The Kitten's Garden of Verses," by Oliver Herford
(Copyright by Chas. Scribner's Sons)

to the cat laureateship with his delightful "Rubáiyát of a Persian Kitten." In this new poetic essay in cat literature he shines both in verse and pictures. Perhaps he does not succeed in captivating us quite so completely as before, when there was more novelty, but his *Garden* is far ahead of D. K. Stephens's *Lyrics of Eliza,* reprinted from *St. Nicholas,* both in its verses and in its illustrations. And why assume a grudging tone when we may reread Mr. Herford's "Winter and Summer"?

**Mendelism.** By R. C. Punnett, Professor of Biology in the University of Cambridge. 12mo. Pp. xiv-192; plates vi-1; text figures 35. New York: The Macmillan Company. $1.25.

The great progress that is being made in the study of heredity is well indicated by the changes that Professor Punnett has made in his little book since the appearance of the first edition in 1905. The present book can hardly be called a "revised" edition, for there remains of the original little more than the title and the general purpose. The book has been

entirely rewritten, making the subject much clearer to the general reader. Several new chapters have been added, a portrait of Gregor Mendel, several colored plates as well as other illustrations. For the person who wishes to know what the experimenters are digging out of the vast storehouse of the tiny germ cells (without being perplexed and bewildered by chromosomes and reduction-divisions and synopses, etc.) this is the most satisfactory book in the English language. In a style that is remarkably clear the essential elements of the problem and the significant facts are set forth, with the aid of ingenious diagrams that enable even one without a knowledge of algebra to follow the mathematics involved in the Mendelian law. The practical applications to the economic breeding of plants and animals are discussed in a very interesting chapter; the relation of sex to the factors in heredity receives two chapters, and there is a reprint of the appendix giving directions for simple experiments in Mendelism for those interested in gardening. The subject of "pure lines" as developed in recent years by the Swede, Johannsen, is beautifully elucidated by means of really helpful diagrams. Most people are interested in the application of these things to man; a dozen pages are here devoted to a statement of the kinds of characters that have been found to follow the Mendelian law in human inheritance. Only two slips are to be noted on the mechanical side. On page 20 there is a reference to the "note on p. 171;" but p. 171 has not the note. On page 120 the word "species" is printed in place of "individual" in a sentence on the distribution of flowers (male, female and hermaphrodite) in certain species of plants.

**The Fruitful Vine.** By Robert Hichens. New York: Frederick A. Stokes Co. $1.40

*The Fruitful Vine* is a brutal story, set in exquisite Roman gold. No man living can write of Rome with such charm as Robert Hichens:

"... something of the open air, olive-colored slopes and ripening on hills stretching down from gray hill towns, with rough walls and campanili to long plains covered with waving corn, dotted with mulberry trees, and threaded by white roads deep in dust along which the wagons drawn by the leading oxen pass, while the drivers lie and sleep, with flowers or bits of green behind their ears."

The pictures of Italy in *The Fruitful Vine* are numerous and full of wistful beauty. But the story of the childless Dolores, with the mother hunger in her heart, not to be appeased by the distractions of Roman society, and always in cruel contrast to the "happy woman" who is the mother of three lovely children, is told with merciless analysis. Dolores is morbid to the verge of insanity and she is surely insane when she sins against her husband's love in order to fulfil his longing for an heir. The inevitable tragedy spreads its black wings over the story of her suffering and expiation; there is, at least, no joyousness in sinning to offend an outraged morality. It is a somber book, and without excuse for having been written, in spite of beautiful passages. Mr. Hichens does better in the desert, where there is more scenery and fewer people. "The Garden of Allah" as he depicted it was so attractive that we do not wonder that the Italians are invading it.

## Literary Notes

....In our last issue we attributed to Burton E. Harrison *The Spell of Holland,* by Burton E. Stevenson (L. C. Page & Company).

....A dainty little book in brown paper covers comes to us from Eaton & Mains: Lynn Harold Hough's *The Lure of Books;* and book lovers such as those for whom this attractive trifle is intended will not find the letter press inferior to the typography (25 cents).

....A very serviceable book on hygienic principles and practice will be found in *Health for Young and Old* (Putnam; $1.50) by A. T. Schofield, M. D. In an unconventional way the author sets forth the laws which underlie health, and makes valuable suggestions in regard to general and particular conditions which affect physical well-being, leaving the definite applications to be made by the reader in accordance with the variation in temperament, surroundings and occupation. It is a book for those who are well no less than for those wishing health restored.

....From Frederick A. Stokes Co. we receive a text book of *Advanced Auction Bridge, With many Illustrations of Hands from Actual Play,*" by the expert of the New York *Sun* (pp. 312; $1).

....Henry Holt is the importer of three dainty volumes (London: Humphreys) which are issued here at one dollar each, and may be recommended to the book lover equally for matter and manner: Bacon's *Gardens and Friendship*, Maeterlinck's *The Inner Beauty*; Chesterton's *Five Types*. These be little books, but the variety suggested by the titles is such as to assure any kind of reader delight in at least one of the three.

...."A Quiet Countryside Chronicle" is the subtitle of Charles Francis Saunders's *A Window in Arcady* (Philadelphia: The Biddle Press; $1.25). A rural diary, it is, in substance, with illustrations from excellent photographs by Henry Troth. This "window" opens on a beautiful scene, and the entries in the "countryside chronicle" are unaffected and, partly for that reason, delightful.

....Dallas Lore Sharp needs no introduction as a nature-writer. In *The Fall of the Year* (Houghton; 60 cents) he has something to say, by way of introduction, of "utterly impossible fox stories" and the defence of a certain nature-faker: "The publishers demanded that chapter to make the book sell." Mr. Sharp does not sympathize with the requirements of such publishers, nor yet with over-sentimentalized nature-writing. He makes himself interesting without indulging in either.

....The author of "Roma Beata" and other volumes, Maud Howe, writes the little volume published by Little, Brown & Co. and entitled *The Eleventh Hour in the Life of Julia Ward Howe*—her mother. (75 cents.) The last five years are the subject of this biography. The home life of the poet is described in its simplicity and sincerity. Mrs. Howe's life was wonderful to the end—

"She never knew the pathos of doing odd-jobs work, such as is provided in every class for those invertebrate workers to whom labor is as necessary as bread or breath. . . . She did good, vigorous work till the end, in her own chosen callings of poet and orator."

....From the sub-title of *The Church Universal* (Macmillan; $1.25) by Rev. J. J. Lanier, B. D., one might expect a fresh exposition of the great doctrines of the Christian faith, but the author's Restatement of Christianity in Terms of Modern Thought is little more than an apologetic for the union of Christians on the basis of the requirements for membership in the Protestant Episcopal Church. Such explanations of baptism, the Apostles' Creed, confirmation, etc., are given as will tend to make them acceptable to men of today. A commendatory Introduction is written by the Bishop of Fond du Lac.

....Guillaume Apollinaire, the poet arrested some weeks ago in the Louvre picture-scandal, writes in the *Mercure de France* that "The Cubists, who are mocked at with so much injustice, are painters who try to give their work the utmost plasticity, and who know that if colors are symbols, light is the reality." The name *cubisme* was coined, he adds, by the painter Matisse, apropos of a "picture" by Picasso. The first Cubist paintings publicly shown were those of Georges Bracque. And M. Apollinaire concludes:

"I have the honor to have first served as model for a cubist painter, Jean Metzinger, for a portrait exposed in 1910 at the Independents Salon."

....The editors of Henry Holt's *Early English Poems* ($1.50) are Henry S. Pancoast and John Duncan Spaeth and their collection illustrates "by representative selections the progress of English poetry from its remote beginnings to the latter part of the sixteenth century," opening with "some of the earliest surviving expressions of the English race in literature," and following the main stream of English verse thru Anglo-Saxon and Norman times. Within a hundred years the world of scholarship has annexed all these centuries and found these more than Milton, to whom the wars of the Anglo-Saxon kingdoms were "battles of crows and kites." The earlier specimens of crow-poetry and kite-verse are chosen from "Widsith" and "Beowolf," from Cædmon and Cynewulf, from the Anglo-Saxon Chronicle and Layamon. The quality of the critical apparatus is guaranteed by the names of the editors.

....From the Columbia University Press (Lemcke & Buechner; $1.50) comes a volume by Professor William Witherle Lawrence, *Mediaeval Story*, with the sub-title: "And the Beginnings of the Social Ideals of English-Speaking People." The book consists of lectures delivered under the terms of the Hewitt Foundation at Cooper Union, in New York City: a less academic audience than one would have a right to expect within the portals of Columbia. Indeed, no definite knowledge of medieval literature is assumed by the lecturer, who has known, moreover, how to interest in his field men and women for whom literature as a fine art has no definite appeal. Lecture second deals with "Beowulf"; subsequent chapters with the "Song of Roland," the Arthurian Romances, the Reynard history, the Robin Hood Ballads, the "Canterbury Tales." An appendix makes suggestions for supplementary reading.

....Carl Halliday's *The Cavalier Poets* (Neale, $2.50) is at once an anthology and a work of criticism and biography. Herrick, Quarles, Herbert, Carew, Lovelace, Cowley, Vaughan, Stanley, Habington, Suckling, Davenant, Marvell, Crashaw, Sackville: the roll call of the Caroline poets is an impressive one. A bibliography of these poets' works is one of the editor's useful performances. His book is an attractive one, and students in especial will welcome it.

....Book catalogs make singularly good reading, if uneven. In a catalog just issued by a New York auctioneer is included Mrs. Thrale's copy of Johnson's "Lives of the Poets," with copious manuscript annotations by that lady. Thus in the margin of the essay on John Milton one may read:

"He (Milton) lov'd Italian music, but Johnson had no notion of any music at all, unless perhaps a catch or Hunting song."

Again:

"To Garrick we owe the Revivification of Shakespeare, tho' none of us had influence with Dr. Johnson to make him confess it. . . . Garrick was always angry when Dr. Johnson said these lines [by Congreve] were better than any twelve descriptive lines in Shakespeare."

Referring to a passage on Dryden's mind, Mrs. Thrale wrote: "This is a portrait of Dr. Johnson's own mind and manners. I told him so and he was not ill pleased."

....Mr. Arnold Bennett is in America: searching impressions of us to transmute into articles and fiction. Interviewed at New York, he was asked what he thought of the statement that the drama is crowding the novel out of existence. "I don't believe it," he said. "You don't think that the demand for the short story is increasing?" queried the reporter. "The demand for the short story is nothing, in England; in America, almost nothing. I mean the short story in volume form." "How long do people want their novels to be?" asked the insistent reporter. "Well," said the author of "The Old Wives' Tale," "I offered a novel of 75,000 words to a publisher, and he said it was too short. My longest novel sold best of all. One publisher actually made the point, in advertising 'Clayhanger,' that the trilogy of which it makes a part forms the longest of my works. People have preferred the long novel all along. The eighteenth century novel ran from 500,000 words to a million. The demand for a novel of about 200,000 words has stayed at that for a long time. A reader who has had his interest aroused doesn't want it cut off soon." Mr. Bennett does not confine himself to discussing the length of novels, but announced himself as the sworn enemy of sentimentalism. "I'm here to battle it," he concluded. In America one may add that is a large order.

## Pebbles

THERE was a meeting of the new teachers and the old. It was a sort of love feast, reception or whatever you call it. Anyhow all the teachers got together and pretended they didn't have a care in the world. After the eats were et the symposiarch proposed a toast:

"Long Live Our Teachers!"

It was drunk enthusiastically. One of the new teachers was called on to respond. He modestly accepted. His answer was:

"What On?"

THE vicar had been suddenly ill, and his church warden was in great difficulty about getting a substitute, when the bishop of the diocese kindly offered to take the Sunday services himself.

The church warden, wishing "to do the right thing," at the close of the service went up to the bishop and, after thanking him stammered out:

"A poorer preacher would have done for such folk as us, your lordship, but we were unable to find one!"—*The Continent.*

Two young employees of a florist in Philadelphia, who are supposed to be variously employed in the rear of the establishment while the boss looks after things in the front, were recently startled by the appearance of the "old man" while they were engrossed in a game of checkers.

The proprietor was justly indignant. "How is it," he demanded, "that I hardly ever find you fellows at work when I come out here?"

"I know," volunteered one of the youths; "it's on account of those rubber heels you insist on wearing."—*Harper's Monthly.*

A PRIVATE soldier once rendered some slight service to the first Napoleon.

"Thank you, captain," said the emperor, carelessly.

"In what regiment, sire?" was the instant response of the quick-witted private.

"In my guards," replied the emporor, pleased with the man's ready retort.

This incident, with appropriate variations, also happened to Genghis Khan, Ivan the Terrible, Attila, Gustavus Adolphus, Louis XIV, Charlemagne, Alexander, King Alfred, Xerxes, Richard the Lion-hearted and Henry of Navarre.—*Success*

AN amateur charity worker, visiting a family in the tenement district, was alarmed to see the mother dash a cup of cold water in the face of the baby she had just finished dressing.

Too polite to express her amazement the visitor held her breath, expecting the air to be rent with screams. When none came, the child merely whimpering, she said: "Dear me, I should think he'd object more than that."

"Wouldn't ye now?" said the fond mother admiringly; "sure I've been practicing on him for three weeks. He won't yell when he's baptized next Sunday! He'll be used to it."—*Ladies' Home Journal.*

WILLIAM CULLEN BRYANT

A bronze statue of William Cullen Bryant, of heroic size, was presented to the city last week and stands in front of the new Public Library, where every visitor will be glad to see it. Mr. Bryant was only eighteen when he wrote "Thanatopsis," which may be called the beginning of American poetry, and which remains the best known poem of home authorship. Moving from Cummington, Mass., to New York, he engaged in miscellaneous literary and editorial work until at the age of thirty-one he became one of the editors of *The Evening Post*, and was its chief editor until his death in 1878 in his eighty-fourth year. He thus, as a poet, antedated Poe, Longfellow, Lowell, Whittier, Holmes, the famous galaxy whose elder contemporary and friend he was; while at the same time he was equally related to the political leaders of the last century from Webster and Clay to Lincoln and Grant. We possess the manuscripts of poems which he wrote for THE INDEPENDENT,

# The Independent

Entered at Ne York Post Office as Second Class Matter
Iublisher, Clarence W. Bowen
130 Fulton Street - - - New York

A WEEKLY MAGAZINE. FOUNDED IN 1848.

One Year, $3.00. Single Copies, 10 Cents.

Single copies over six months old 25 cents. Postage to any foreign country in the Universal Postal Union, $1.75 a year extra; to Canada, $1.00 extra. Subscriptions will be received for other periodicals, and clubbing rates will be granted as low as offered by any responsible agency.

Order for the change of an address should be received two weeks before change is to take effect. The old as well as the new address should be given.

For the convenience of our subscribers we will send on receipt of publisher's price any book reviewed or advertised in our columns.

Volumes of The Independent are completed at the end of December and June, and a full index is furnished free on application. Neat binders holding in book form thirteen current issues will be furnished for 45 cents.

If the numbers comprising any semi-annual volume are returned to us prepaid in good condition with $1.50 we will bind the volume in handsome and substantial half buckram and deliver it free anywhere in the United States.

We are always glad to receive articles for examination, but writers desiring the return of their manuscripts, if not accepted, should send a stamped and addressed envelope. We cannot, however, even so, hold ourselves responsible for their return. Authors should preserve a copy.

Advertising rates will be furnished on application.

## Prosecution of Combinations

From time to time interesting remarks about Trusts, competition and the Sherman act have been made by prominent men. A few weeks ago, Mr. Nagel, Secretary of the Department of Commerce and Labor, a lawyer of exceptional ability, said in a public address that "the law which was intended by its authors to preserve competition has become an instrument which may effectually check it." For example, if a group of capitalists should desire to organize a strong corporation in order that they might compete with an existing consolidation, and should ask the Attorney-General whether their plans would expose them to prosecution, he could not give them the information nor could he sue them to get an answer from the courts.

Charles A. Prouty, a member of the Interstate Commerce Commission, speaking in Brooklyn on October 23, said that altho the Sherman act was more than twenty years old, no lawyer could today "advise his client with certainty" whether he was "within or without the inhibition" of the statute. He continued:

"The greatest commercial enterprise in our country is the United States Steel Corporation. Its capitalization is close to $1,500,000,000. It employs a hundred thousand workmen. For ten years it has been in the public eye, and it is generally understood that its operations have been entirely aboveboard; yet it is profoundly uncertain whether that great enterprise is legal or not."

Three days later the Government brought suit against the Steel Corporation. Commissioner Prouty also said he believed that relief from the evils connected with combinations could be obtained only by direct Government regulation. A commission should be appointed. After the Northern Securities decision he had publicly exprest the opinion that it would not affect the railroad situation in the Northwest, and for this remark he had been "taken severely to task" by President Roosevelt. But events had fully verified his prediction. "It is not the monopolization of trade thru restraint of trade that does the mischief, but monopolization thru unfair methods of competition."

"Nothing short of absolute competition will satisfy the Department of Justice," said Attorney-General Wickersham a few days ago at Omaha, referring to the Tobacco Trust reorganization plan. On October 27, when he was asked whether he expected to see business restored to the conditions of competition which prevailed before the Trusts were formed, he replied:

"I cannot, because I do not think it possible. We cannot return to our swaddling clothes."

But the Department of Justice, in its suit against the Steel Corporation, asks the court to restore the original conditions, "the swaddling clothes," by ordering not only a dissolution of the Corporation and a separation, one from another, of the companies that were united to form it, but also a disintegration of each of the constituent companies. Each of them was made by consolidation. The words are: "That each and all of the said constituent or subordinate companies, each in and of itself, as well as each and all the elements composing each, be dissolved."

Mr. Wickersham said recently that by consulting a well-known manual of corporations he had found about one hundred companies that ought to be dissolved. The inference was that dissolu

tion was required by the law simply because each of these companies had been formed by a consolidation of several, and because the union had ended competition among these constitutent parts.

President Taft says we must get back to competition. A fair inference to be drawn from several of his recent speeches was that mere consolidation which ended competition among the parts thus united was enough to make the corporation illegal and to require the disintegration of it. On October 27, however, he said in Chicago:

"Mere bigness of plants, mere bigness of company or corporation, does not constitute a violation of law."

But bigness generally implies a consolidation of concerns which were once independent and in competition among themselves. Bigness and evidence that it had been acquired by consolidation guided Mr. Wickersham in picking out the hundred offenders. What the President said on the 27th approaches more nearly than some of his other remarks during his Western tour the following passages from his speech of acceptance in 1908:

"The combination of capital in large plants to manufacture goods with the greatest economy is just as necessary as the assembling of the parts of a machine to the economical and more rapid manufacture of what in old times was made by hand. The Government should not interfere with one any more than the other, when such aggregations of capital are legitimate and are properly controlled, for they are then the natural results of modern enterprise and are beneficial to the public. It is perfectly conceivable that in the interest of economy of production a great number of plants may be legitimately assembled under the ownership of one corporation. Competition in a profitable business will not be affected by the mere aggregation of many existing plants under one company, unless the company thereby effects great economy, the benefit of which it shares with the public, or takes some illegal method to avoid competition and to perpetuate a hold on the business."

To all of this, we think, the managers of the Steel Corporation, of which its competitors do not complain, will assent. But we presume they cannot understand why not only the Corporation, but each one of its constituent companies, ought to be disintegrated.

The remarks we have quoted show differences of opinion and some inconsistencies, with respect to a question of great importance. The suit against the Steel Corporation—which, by the way, if it exists in violation of the law, has violated it with impunity for ten years—indicates that the policy of the Department of Justice is in accord, not with Mr. Taft's views in 1908, but with a later doctrine or interpretation of the statute, to the effect that mere aggregation or consolidation, without regard to unjust and oppressive methods, is unlawful. Perhaps it is, and if so, the President is bound to enforce the law. But it ought not to be, and if the President thinks, as he did in 1908, that it ought not to be, he should say so and ask for amendment of the law. If there must be and ought to be disintegration for a restoration of the original competition, where is it to stop? Must it reach down to the alliance of Judge Lacombe's two owners of express wagons that went to and fro across a State boundary?

This latest suit, in our judgment, emphasizes the demand for a careful inquiry as to the whole matter by a competent commission. Probably such a commission of investigation would recommend the appointment of an Interstate Trade Commission, which, by supervision and regulation, could prevent injustice and at the same time preserve for the people and the nation the economic advantages of consolidation and concentration.

## Denial of Immortality

In an address at Columbia University last week Dr. Max Verworm, Professor of Physiology in the University of Bonn, went far beyond physiology in denying positively the immortality of the soul. It is the old argument that because mental action is accompanied by brain activity, therefore the brain activity is all there is of the mental action. He says:

"Every act of consciousness is intimately dependent upon the vital processes in certain cells of the cortex of the cerebrum. Innumerable facts testify to this and thence comes the answer. If even a single condition of a complex phenomenon fails, the phenomenon itself ceases. The phenomenon of human consciousness ceases with the life of the cerebral cells. But the life of these cells is extraordinarily frail. Even the stoppage of the blood for a few seconds suffices to paralyze

them and completely to inhibit consciousness. These facts have been experimentally confirmed upon men. Hence our individual soul is no more immortal than our individual body."

That is a big jump to a conclusion. We have observed that in building a house a carpenter uses hammer, saw and chisel. While he has them he works; when they are taken away all work ceases. Therefore the tools build the house; there is no man behind them. Let us suppose for a moment the carpenter made invisible, as was Gyges when he wore his magic ring, and we have exactly what may be the case with the brain as the tool of the soul. Why may it not be? Professor Verworm knows no reason to the contrary.

Those physiologists who will have it that the brain is all the soul we have, and who thus rest everything on physical factors are very unwilling to recognize causes as real and valid; they only know the precedent conditions; and when they have found those they think they have found all. It is the doctrine of agnosticism of Mill forty years ago, still taught by Haeckel. The common mind sees veritable causes, and it is likely to follow back to an original Great Cause. When the mallet hits the ball and the ball moves Professor Verworm would see only a condition, so far as he knows invariable, and the hand that holds the mallet another condition, but not a cause. Science, he says, is concerned only with conditions, not with causes. If so philosophy will not hesitate to transcend science and to declare that it intuitively knows causes also, and that intuition is as good a source of knowledge as observation.

In his process of getting rid of the invisible soul Professor Verworm finds it thus convenient to get rid of causation and also of any such thing as "vitalism." He can see no new force in life that is not also in dead matter. To be sure, we have not yet been able to combine matter so as to make synthetically the simplest organism, not even a single cell; but the reason is that we do not yet know enough about its composition and the arrangement of its atoms. And with this ignorance as a basis he proceeds to assert that if we could arrange the dead atoms aright, in the right conditions, all the phenomena of life, up to human intelligent activity, would follow:

"We may affirm this: If we could once succeed—and this would be possible by a single stroke—in assembling in their proper quantitative relations and positions and with the proper motion of their smallest particles all the substances that an amoeba contains at a given moment, and if at the same moment we could surround this artificial amoeba with the natural external conditions of its life, the artificial system would live like the natural amoeba. This picture means nothing more than that the life in a given organism is determined simply by the sum of its internal and external vital conditions. Wherever all these conditions are realized there is life for that specific form of organism; and all its general and special vital performances can happen, such as its nutrition and respiration, its production of matter and energy, and if it were one of the higher organisms, even its sensations and feelings, its thinking and willing for its life is identical with the sum of the conditioning factors."

The meaning of this is clear, that life is no more than chemistry; that there is no vital force, only the arrangement of physical conditions, and in the presence of the conditions the processes which we call life are automatic. He thus declares a purely mechanistic philosophy. But we declare that this Bonn physiologist represents present science only in part, and much less generally than thirty or forty years ago. Biologists discover a vital force, not chemical, which antagonizes chemistry, which selects and guides and creates after a pattern. Is it the mere mechanistic force inherent in atoms which, when the eye or leg of a salamander is removed, will set to work and reproduce it? The eye will be restored by growing out of the lamina or filament from which it originated in the ovum; and if that is removed it will sprout from one to which it does not properly belong, or even from a third. It is impossible to conceive of that as the action of the most refined inorganic chemistry. It is too selective and purposeful. So our learned visitor goes far beyond his knowledge when he says to a large and interested audience:

"Wherever and whenever, upon any heavenly body in the universe, the conditions for the origin of life appear anew, there living substance is formed out of lifeless substance."

We have at present no scientific evidence as to the origin of life. We know it exists, and we know that all efforts of sci-

ence to originate it are thus far futile. For its origin, and for the origin of mind, or soul, we must inquire not of physiology, but of philosophy, or, if we please, of religion. Most of us will find it more consonant with the appearance of things to believe that we have a mind, or soul, which is more than brain, and which uses the brain as its tool; and that this mind, or soul, may survive its tool, and such belief is not unscientific.

## A Chinese Talleyrand

EVERY Chinese is an enigma to the Western mind, but the greatest enigma of them all is the man who has been called to the helm of state in this storm, the only man, if there be any, who can save the empire from shipwreck, Yuan Shi-Kai. He has been suspected and trusted alternately by Manchu and Chinese, reformer and conservative, foreigner and native. The late Emperor, who had made him his chief adviser, curst him with his last breath as a traitor and cause of all his misfortunes. The late Empress Dowager, who had favored him above all others, denounced him at her last council. The present Regent, his bitter enemy, has now made him virtual dictator of the empire. He is a possible intermediary between Manchus and rebels, because each party believes he is on their side; the Manchus trust him to support the dynasty, the rebels trust him to promote reform. Trained in the school of devious diplomacy under that consummate master of the craft, Li Hung-Chang, he has pursued a tortuous course thru the troubled waters of Chinese politics ever since. His career would make the plot for a melodrama were it not too sensational and improbable for the stage.

Three years ago this summer, shortly before his fall, Yuan Shi-Kai would have been regarded as having attained the proudest hight of happiness and success. His voice was the most influential at court. He was the recognized spokesman of China among the Powers. He held the position of Viceroy of Chi-li, the most important province in the realm, and, what was more, he had under his command an army of foreign drilled troops which compelled the admiration of European experts. On the occasion of his fiftieth birthday, officials of all ranks hastened to congratulate him in person, by proxy, or with presents.

The Empress Dowager sent him costly tokens of her esteem. Manchu princes paid their respects to him, an upstart Chinese. But it was noticed that the most prominent of the Manchus, Prince Chun, brother of the late Emperor, father of the present Emperor, did not appear. He was kept away by a temporary indisposition. He it was who as Regent deposed Yuan Shi-Kai four months later and last week called him back.

The walls of Yuan's reception room were hung with birthday scrolls, each word a work of art, expressing felicitations or recalling some happy event in his career, sent in from all parts of the country by his friends and admirers. But were they all from friends? Two of the scrolls when closely observed were seen to be of sinister import. How they got there is not known. As soon as discovered they were hastily taken down and put out of sight. One of them read: "May Your Excellency live ten thousand years!" Surely a proper and a pious wish? But, no. Only the Emperor is entitled to live 10,000 years, and to hint that Yuan might aspire to such longevity was to suggest unmentionable things. The other suspicious scroll was simply inscribed with a date, the 5th Day of the 8th Moon of the Year Wu Shen.

That date, ten years gone, was indeed a turning point in the career of Yuan Shi-Kai, but one which he himself would fain forget, even tho his conscience may assure him that he acted for the best. It was the day when he betrayed his sovereign into the hands of the vixen behind the throne. At dawn that day he had been called in secret audience by Emperor Kwang Hsu, in the Palace of Heavenly Purity. The series of edicts which the young Emperor had been issuing in rapid succession had startled the world and incensed the conservatives of the empire. To abolish civil service examinations in the classics, to reform the army, to reorganize the Government, and

to deprive the Manchus of their sinecures and make them work for a living like Chinese, this and more like it, was indeed a good deal to do, or to order done, within three months. The forces of reaction were gathering and the Empress Dowager was plotting to depose the Emperor, whom as a boy she had put upon the throne.

A few days before the Emperor had sounded Yuan to see if his loyalty could be depended upon in an emergency, and he had replied:

"Your servant will endeavor to recompense the Imperial favor, even tho his merit be only as a drop of water in the ocean or as a grain of sand in the desert. He will faithfully perform the service of a dog or a horse while there remains breath in his body."

Now, in that early morning audience the Emperor asked him to nip the conspiracy in the bud by the seizure of the leading conspirators. He was ordered to go first to Tien-tsin, arrest and behead Jung Lu, Viceroy of Chi-li Province and Commander-in-chief of the army. Then he was to return to Peking and imprison the Empress Dowager, who was to arrive at 8 o'clock that morning to perform sacrifices at the altar of the God of Silkworms. The Emperor gave Yuan edicts appointing him Viceroy and Commander-in-chief in the place of Jung, and placed in his hands a small arrow, to show that he was the authorized emissary of the Emperor.

Yuan Shi-kai took the noon train to Tien-tsin and went directly to the Viceroy's yamen. Now, he and Jung Lu had long ago sworn brotherhood by the rite of blood, and when Yuan asked him if he regarded him as a faithful blood brother, the Viceroy answered, "Of course I do."

"You well may," replied Yuan Shi-kai, "for the Emperor has sent me to kill you, and instead I now betray his scheme, because of my loyalty to the Empress Dowager and of my affection for you." He then gave the edicts to Viceroy Jung, who chartered a special train for Peking and forced his way into the forbidden apartments of the Empress Dowager, demanding a sanctuary. That night a secret meeting of the conservative officials was held in her presence, and early next morning the Emperor was seized by her eunuchs and put in prison, where he remained for two years. A decree issued in his name informed the people that in this difficult crisis he had called upon the Empress Dowager to serve as Regent, as she had twice before, and that, after being repeatedly besought, she had graciously consented to assume the responsibility.

Treacherous as seems to us this desertion of his Emperor at the time when he was getting into trouble by trying to carry out the reforms which Yuan had recommended to him, still we must remember that if Yuan had not by this act won the favor of the Empress Dowager, he would not ten years later have been able to assist her in the effectual inauguration of these same reforms. He would not have been in a position to check her from going to an extreme two years later, when she had been captivated by the ideas of the Boxers and threatened to consummate a crime abhorrent alike to the principles of all barbarous and civilized nations from the beginning of time, the murder of ambassadors. When she called upon Yuan Shi-kai to march his army to Peking and annihilate the legations, he evaded the order and procrastinated, and finally gave the word which brought about the march of the allied Powers to the capital and the flight of the Dowager Empress. That telegram which Minister Wu-Ting-fang held in his hand when in unaccustomed haste he rushed up the steps of the White House and relieved the anxiety of the world by the news that the foreigners besieged in the British compound were alive and safe, came from Yuan Shi-kai. By this act as well as by his excellent administration as viceroy and his encouragement of education, he so won the confidence of foreigners that when, at the death of the Empress Dowager in 1908, the reactionary party secured his overthrow, the representatives of the Powers at Peking held a meeting to consider whether they should not intervene to insist upon his retention in office as the only man they could trust.

Such are the vicissitudes in the career of a successful statesman in what has not inappropriately been misprinted as "the Muddle Kingdom."

## Civil Service Pensions

In an article in *The Popular Science Monthly* Dr. Henry S. Pritchett, who is director of the Carnegie Foundation, which gives pensions to retired college teachers, has this to say of pensions in general:

"Pensions are characteristic of modern civilization. . . . The modern pension systems appeared in the nineteenth century and have shown a rapid growth. Their extension to all orders of society has been a feature of the opening decade of the twentieth century. This result is due to two facts: first, to our quickened sense of humanity; secondly, to the clearer apprehension that such humanity means more effective service and an improved condition of society. . . . The United States Government has hitherto lagged behind other nations in the investigation and study for the civil pension for its old servants."

Our Government has not only lagged behind other nations in its care for its aged and worn-out servants, but behind business corporations of the highest character. The Pennsylvania Railroad, the New York Central Railroad and the United States Steel Corporation are among those which have established systems of pensions for their officers and servants, and they are satisfied that it works well. The United States has such a system only for its army and navy, as if no other department were equally worthy of its benefit. In all probability the enormous expense of our war pensions, which has strangely increased from year to year, until in 1910 it amounted to $160,000,000, accounts for the hesitation in giving pensions to our aged civil servants; but this last year there was a reduction, due to deaths, of over $3,000,000; and in the order of nature the total must rapidly decrease.

It is too late to need to argue in behalf of the civil service pension in these days when the most advanced European nations are providing it for all aged people whose income has been so small in their working years that they could not accumulate property to support them in their old age. The wages of clerks, who form the bulk of our civil service, is a very moderate one, but it has the advantage of being permanent. Its members have to live in a respectable way, and are liable to be left in need in old age. Out of pity for them only a hard-hearted superior will drop them when they are too feeble to do the full work of a younger man or woman. The offices at Washington, we learn, have a multitude of such superannuates, who manage to get to their desks and who should be retired, and immediately would be retired, to the benefit of the service, if their few remaining years were provided for. Members of the Cabinet have in previous years advised that Congress establish such a pension system, but Congress has delayed, doubtless because the war pension has been so expensive. But under a contributory system, if that is adopted, the expense would be divided between the Government and the beneficiaries; and the immediate reduction in the number of those now receiving salaries would somewhat relieve the cost. We would be pleased if all the members of the Cabinet should again press this matter on Congress, and if the President would add his urgency. The question has been sufficiently considered, and we see no reason why Congress should not, at its present session, enact a suitable civil pension law.

## The Joys of Genealogy

AGAIN the newspapers have been merry over the aristocratic pedigrees of our simple-hearted multimillionaires. Mr. John D. Rockefeller's royal blood, and the noble French forebears of the Teutonic Astor family, have irreverently been called in question. Nothing is sacred any longer in the eyes of modern microscopic scholarship. Sniffing at all the nice old myths and fairy tales, the up-to-date grubbers in dates and handwriting insist that a self-made American, even if he has the price, can't be really and truly the scion of a royal house if one of his dim and distant grandmammas was only ten years old when his grandpapa, one generation less remote, was born.

We suppose that these unimaginative critics are right, and that affluent families of comparatively recent repute should not be indulged in their propensity to elongate their historical respectability. It is a bad thing, we acknowledge, to encourage overmuch the genealogical fakers who, for fees duly paid, stand ready to supply, while you wait,

any kind of ancestors that you most need in your business—or your social struggle. Faker genealogists have been getting loathsomely fat on American wealth, and should be driven into a more useful occupation. We acknowledge, too, that it is not fair when Americans that happen to be in fact descended from aristocratic and even royal houses (and who have a curious habit of saying nothing about it) are shoved aside in the estimation of pedigree-worshippers by men and women whose claim cannot be substantiated.

At the same time, we do not like to see genealogy itself brought into disrepute, or good old blue blood set at naught. We have never been able to get over a conviction that there is truth in the saying that "blood will tell." Perhaps the biologists don't know very much about heredity, but we confess that we don't believe that the environmentalists—whether they be socialists or syndicalists—will ever succeed, with or without a union label, in marketing the whole supply of mule meat for beefsteak. We have a suspicion that, if the facts were all told, it would appear that an astonishingly large proportion of our most unpretentious Americans of real caliber, men and women that have done big things in business, in politics and in the professions, in science, in scholarship and in art, could show pedigrees well worthy of serious examination; not necessarily descents from kings and nobles, but descents from families in which intelligence, courage, persistence and resourcefulness have characterized an extraordinarily large proportion of the kindred.

Where pedigrees of this kind can be established, it is, we believe, well worth while to devote a reasonable amount of time and money to the necessary genealogical research. Pride of family and of ancestry, so far from being a bad thing, or a thing to be held lightly, might be cultivated in our modern civilization with happy results. We have come to regard with too much indifference those achievements in life which can't be bought with money or raced after in a car. A little more regard for the things that make for dignity, serenity, peace of mind, considerateness, and that gracious kindliness which once was associated with the words "gentleman" and "gentlewoman," would be good for the American people. These things have always been associated, and probably will continue to be associated, with family pride. "Noblesse oblige" is a phrase that applies to intellectual and moral rank quite as truly as it ever belonged to the rank ruthlessly created by the sword and established as legalized privilege.

And genealogy itself, as a pursuit, deserves a kindly word in its own behalf. Hunting ancestors is a harmless sport. It inflicts fewer cruelties—altho as we have seen it now and then has to inflict some—than fox chasing or bagging big game in Africa. It has its exciting uncertainties, and a beautiful element of luck, withal, which appeals to a gambling instinct that survives in the best of men, and ought to have some harmless expression. As an interesting game, which can be played on any scale of expense desired, we heartily commend the genealogical quest.

## Elevators and Health

A MORE or less distinguished Berlin physician who is visiting this country is said to have declared not long since that riding in fast elevators is the cause of heart disease and is shortening life here in America. The catching of the breath which occurs involuntarily when elevators start and stop on their rapid course is said to be an indication of the physical evil that is being worked by this rapidity of up and down motion. Quite naturally the assertions have been the subject of no little comment in the daily press. It is very unlikely that any of our American dwellers in many storied office buildings and apartments will be disturbed enough by such an announcement to stop riding in elevators and proceed to go on foot up the long flights of stairs, but some of them may have the feeling that perhaps this German savant —of course, if he is from Germany he is a savant and his opinion must be a serious contribution to science—may be expressing a newly discovered truth in medicine, which would account for the increase in heart disease that had been noticed in this country.

It is quite certain that, far from causing any injury to the heart, elevators

have rather been a cause for sparing that important organ much unnecessary labor and serious strain. There is probably nothing that is harder on the heart than the going up many flights of stairs. The pumping of blood thru tightly contracted muscles during the process of lifting the body up to a hight is one of the hardest tasks that the heart can have. It throws intensive work on it, and, while if one is trained so as to enable the heart to do work of that kind, the evil effects are not noted, without special training the strain if often repeated is likely to be injurious. It is nearly the same as if one no longer young who had not been in training were to attempt to run a quarter of a mile at top speed. The effort strains structures that are not in trim for such a task. A physician would not permit a man suffering from any heart affection to do running of this kind; and in the same way the ascending of flights of stairs is promptly forbidden whenever there is a heart lesion present. Men who are suffering from heart disease have been kept at work and enabled to do their work longer because of the presence of the elevator than by any advance that there is in therapeutics.

While the elevator is thus so important an adjuvant for the heart so far as going upstairs is concerned, it is probable that most people would be benefited by walking downstairs when occasion afforded the opportunity, and that, as a rule, men would be better for some of the easy, buoyant exercise afforded by tripping downstairs. A distinguished German authority in the treatment of obesity has recommended walking downstairs rather rapidly as probably the best possible means of taking off surplus adipose tissue, and particularly that which collects in the abdominal region and is hard to remove by ordinary forms of exercise such as walking and the like. The gentle jolting motion tends to lead to the reabsorption of the fatty material that is accumulated, and he insists that there is no better way of reducing the waist line than this of descending stairs. Some American physicians have tried the suggestion on a number of patients with reported success.

On the other hand, there is probably no better exercise for the ankle joints than that of coming down stairs. One of the most frequent sources of complaint of extreme fatigue and of achy feelings that are often supposed to be rheumatic is the yielding of the arch of the foot with a tendency to the development of flatfootedness. This has grown very common in recent years, mainly because of the small amount of brisk exercise of the feet that men take. We do much standing, often standing even on long rides, but little rapid walking. The consequence is that the muscles which normally hold the joints of the ankle firmly together become flabby and allow the gradual disappearance of the arch and the relaxation of the ligaments of the ankle joints. Many people wear flatfoot braces for this; and in advanced cases such a crutch is probably necessary. In most cases and particularly at the beginning of yielding of the arch it would be much better if exercises were practised to restore the strength and firmness and the contour of the arch rather than support it by artificial means. Not so long ago men walked briskly for a mile or two, two or three times a day or oftener, and thought nothing of it. Now when we want to go a mile we ride. The elevator has taken away the exercise for the feet that used to be obtained in going up and coming down the stairs. So far as it is of use in facilitating ascent in the high buildings it is an advantage. It would be probably much better, however, if it were not used quite so much for coming down, and if people took advantage of the descent to strengthen important leg muscles and dissipate certain tendencies to accumulation of fat where it is most disfiguring. If our distinguished German medical visitor will bring about a general calling of attention to this by his condemnation of the elevator it is probable that his remarks will do good.

In his reported interview he suggested that the catching of the breath that occurs with rapidly starting elevators is a special deleterious factor. This, of course, is noticed only in those who are not much used to elevators and in them only when the elevator starts to descend. So far as there is any interference with heart action it is the descent that is of most importance. There would seem to

be a number of reasons therefore why our stairs should be used more on the way down than they are at present.

**Kipling on Woman Suffrage**

The methods of the suffragets have greatly disgusted Mr. Kipling, if one can gather from his poem in *The Ladies' Home Journal*. It begins by telling how the he-bear will often turn aside when the peasant shouts, but not the she-bear, who will rend him. So the male cobra will glide away at a man's approach, but his mate will coil and strike. Equally the Indian warrior may spare his captive, but the squaw will insist on torture; for in every case

"The female of the species is more deadly than the male."

The woman jumps to a swift and fixt judgment and passes final sentence without reconsideration or mercy, while man will hesitate and wait till he can study the reasons and the consequences. Therefore women can properly press their instinctive judgments, but are not constituted so that they can elect members of Parliament or be chosen to public office. Mr. Kipling does not say all that in so many words, but it is what his verses mean.

"So it comes that man, the coward, when he gathers to confer
With his fellow-braves in council, does not leave a place for her
Where, at war with Life and Conscience, he uplifts his erring hands
To some God of Abstract Justice—which no woman understands."

To Mr. Kipling's copyrighted poem we venture to add two stanzas which seem to have been omitted in the text as printed:

When the bulky female spider lures the male to her embrace,
She beckons him with her nippers, but he stays a little space;
Then very cautious his approach, and safe his swift retreat,
For he knows the female spider loves a husband fit to eat.

And there's venom in a woman's love, to fight till she is dead
With claw and tongue she'll fight for her young, while her man hides under the bed.
When her boys hung round where booze was found, 'twas the woman's hatchet smote;
Now State by State we haste to trust to the deadlier sex the vote.

**New Cardinals**

The statement comes, this time apparently trustworthy, that the Pope will appoint new Cardinals in a few weeks. There will be seventeen of them, we are told, an extraordinary number; but the present number is very small, and some cardinals are too feeble to attend in case of the election of a new Pope. Pius X has the reputation of not caring much for his Cardinals, and this sudden designation of a consistory cannot but confirm the stories of his ill health. No less surprising than the number is the announcement that only five of them will be Italians. This would show a better apprehension of the fact that the Church is much stronger out of Italy than in it. To the United States are assigned, says the report, two Cardinals, Archbishop Farley, of New York, and Archbishop O'Connell, of Boston, and also the naturalized Italian, Mgr. Falconio, the Papal Delegate to the United States. This list carefully omits Archbishop Ireland, the ablest and wisest of our archbishops, who has done more for his Church than any other of them, but he is now perhaps too advanced in years to be appointed, and his friends, too ambitious for him, had years ago spoiled his chances, and he had enemies among his own ecclesiastical brethren. Besides, he has been a Republican and suspected of liberalism. The dignity will go for the first time to Boston, where it was expected; for Archbishop O'Connell is a man of much ability and has long been a favorite at Rome. He was for some years rector of the American College at Rome for the education of American priests, and has, since being transferred by the special will of the Pope, from the diocese of Portland, Me., to the archdiocese of Boston, represented the Church in the Philippines. While not the most popular of dignitaries with his priests because of his arbitrariness, his rule has been marked with vigor and growth. The supremacy of the New York archdiocese makes it eminently proper that Mgr. Farley should receive the honor, and that a second red hat should one of these days be hung up aloft in St. Patrick's Cathedral.

**A Brooklyn Anniversary**

On last Thursday *The Brooklyn Eagle* celebrated its seventieth anniversary. When it began publication in 1841 Brooklyn was a little adjunct of New York, with 35,000 inhabitants, who crossed the East River to their business in small sidewheel ferryboats when the ice did not prevent. Sometimes they walked across on the ice. But Brooklyn grew, became the famous city of homes and churches, and *The Eagle* grew with it until it became long ago the leading journal of its borough, which now has over 1,700,000 inhabitants. In 1908 THE INDEPENDENT issued its sixtieth anniversary number, and we gave an unusually free and intimate account of its history. The same thing has been done for *The Eagle* by its proprietor, Col. William Hester, for thirty-five years its publisher, and by Dr. St. Clair McKelway, its chief editor for twenty-six years, and a very interesting story they give us. Colonel Hester rose from the compositor's stool, as did also Thomas Kinsella, who was for a long time its famous editor. When the Civil War broke out Henry McCloskey was editor, and he was bitterly opposed to the Government and favored the right to secede. The Government denied the paper the privilege of the mail service and threatened to suppress its publication, and would have done so if Mr. McCloskey had not been forced to resign, his course having much displeased the proprietor. *The Eagle* has been a very independent Democratic paper, and under Dr. McKelway's editorship it refused to support Mr. Bryan's free silver campaign, and it has been equally independent in local politics. Dr. McKelway belongs to the elder type of editors whose personal power dominates the journals they edit. He is a public speaker of rare ability, and thru the platform as well as the desk has been a molder of sound, conservative public opinion, and a man of official influence in the educational policy of the State. The personal relations of THE INDEPENDENT to Brooklyn have been very intimate in the past, and we are glad to give deserved honor to our elder contemporary, which has done so much to give guidance and distinction to the borough across the East River.

The death of Joseph Pulitzer, owner and editor of the New York *World,* removes an extraordinary type of editor. He came to this country a penniless boy, enlisted in the army, and served during the Civil War, went to St. Louis and was so poor that he hired out to dig trenches to bury cholera victims, but tho then ignorant of the language, in four years after landing at Castle Garden he was admitted to the bar, and a year after, at the age of twenty-two, he was city editor of a German paper and elected to the Missouri Legislature. After buying a moribund paper in St. Louis and making it a success, he bought the New York *World* in 1883, changed its character completely, made it sensational, independent, popular and profitable. It was a new type, much objected to, and out of it went the men who developed the *American* and *Evening Journal,* which was like the *World,* only more so. His blindness clouded his last years, but his energy never flagged. His highest virtue was his wilful independence.

The young men in China are having their innings. The new Chinese Minister at Washington, S. Alfred Sze, graduated from the Washington High School only fifteen years ago, and later from Cornell University. He has since been connected with the Foreign Office in Peking. And now we have hundreds of such Chinese young men being educated in this country, on whose influence will depend for a hundred years peace and good will between the two countries.

The trial of McNamara, in Los Angeles, has been going on now for two weeks, and the jury box is not half filled. The administration of criminal law in this country is, as President Taft has said, a disgrace to our civilization. In 1910 we had the enormous number of 8,975 homicides, and yet only one in 86 met with punishment.

That Dr. Cook, man of fame and infamy, should have dared to try to lecture in Copenhagen shows the limit of possible impudence. It is impossible for him to reinstate himself, and his best future is to crawl into his hole and draw it in after him.

# Insurance

## Policy Loans Again

We have repeatedly taken a firm position against policy loans and have supported the companies that have placed restrictions on this phase of their business. We print herewith a letter received recently from one of our subscribers.

Wichita, Kan.

*Editor Insurance Department, The Independent:*

Your editorial entitled "Policy Loans" in the October 12th issue of The Independent calls attention to the evil of such loans. In my opinion, this is due to the manner in which many life insurance agents present their case to the prospective policyholder. Limited payment and endowment insurance is presented in a manner which emphasizes the loan values and investment features of the contract, and makes the protection seem a secondary matter. If agents would endeavor to write more ordinary life insurance, endeavoring to get the policyholder to get as much *protection* as possible for the amount of the premium, the loan values would be, in proportion to the amount of premium paid, less than the values of endowment or limited payment life, and the temptation to borrow would be less. Many a young man is argued into taking an endowment policy, which he really cannot afford, gets small protection in proportion to premium, then takes more insurance because he needs more protection, and the premiums become so burdensome that he is forced to borrow in self-defense.

Respectfully,
Guy Haythorn.

This expression of opinion is valuable, as it comes from an actual policyholder, and his views may be considered representative. Insurance companies and writers may voice their opinions, but after all, it is the point of view of the prospective or actual policyholder that finally counts. While ordinary life is the cheapest form of insurance, it adequately protects the family during the early years of marriage, presupposing that the head of the family will be financially successful in future years. Endowment policies, however, have the incentive of saving as a feature, and provided no loans are made, will yield a substantial sum for permanent investment on maturity. The wise company, thru its agents, should emphasize this feature, rather than the loan value.

Owing to the insurance law restricting the amount of new life insurance that a company may write, the New York Life has been forced to notify its agents that policies written on applications received during the remainder of 1911 will be subject to delivery after January 1, 1912. In other words, the public must wait to insure in the New York Life until after the first of the year. The law limiting new business is unjust and disadvantageous to both the company and the agents. The disappointed prospect who either changes his mind and does not insure, or who selects a smaller and supposedly weaker company, is not benefited either.

The Newark Fire Insurance Company, of Newark, N. J., will celebrate its one hundredth anniversary on November 6, 1911. The company will celebrate by moving into its new building, a handsome marble structure. The building is entirely fireproof, even the office furniture being made of steel. The Newark Fire Insurance Company is one of the oldest in this country, and has had a successful career. The company on January 1, 1911, had a net surplus of $457,845, an increase of $59,631 during the previous year.

The months of August and September have shown a great improvement in the record of losses for the fire insurance companies. October, 1910, was one of the worst months on record, with a total loss of $37,000,000. The companies are hoping for a favorable October this year, to compensate in a measure for the abnormally heavy fires in the spring.

A Philadelphia judge has just decided that a section of the anti-rebating law means that it is a discrimination to accept one man's cash and another man's note in payment for a life premium.
